In the Pennsylvania anthracite mines 43% of the employees are English speaking and this number is charged with only 28.8% of the fatalities, whereas the other 56% (representatives of continental Europe) sustained 71% of the fatalities. Likewise in the Pennsylvania bituminous mines the English-speaking employees represent 35% of the total and are charged with 27% of the fatalities, whereas the other 65% (representatives of continental Europe) are charged with 73% of the fatalities. As regards the figures for West Virginia the English-speaking employees represent 67%, and notwithstanding the fact that this includes 17% of colored employees, only 53% of the fatalities are charged to the English-speaking employees, whereas the other 33% sustained 47% of the fatalities. Almost the same ratio holds for non-fatal injuries in the three groups of mines cited.

Had the fatality and injury rate for the English-speaking American been maintained throughout the three groups of mines, there would have been a saving of 716 fatalities and 900 very serious injuries, a strong argument for Americanization and education of the miner.

With the cession of Alsace-Lorraine to France, Germany loses the rich potash deposits of Alsace, and with them the potash monopoly of the world, according to the 'Vossische Zeitung'. The potash deposits extend 16 kilometres (9.94 miles) to the north of Mulhausen, over a surface of more than 180 square kilometres (69.2 square miles). They are unusually rich in potash salts, much richer in fact than the beds in the interior of Germany. They are, moreover, easier to exploit. Their thickness ranges from 3.7 to 5.4 metres (12.1 to 17.7 ft.). The thickness of the smaller beds in the upper layers varies from 0.8 to 1.5 metres (2.6 to 4.9 ft.). The first workings were begun in 1909; in 1913 there were 12 in operation. In a period of only three years the production rose from 42,420 to 287,000 metric tons, so that the production of potash in Alsace in 1913 was already one-fifth of the entire German output. The total capital invested in the potash work of Alsace amounted to 34,400,000 marks (\$8,187,200 at normal exchange). The production of these workings, it is calculated, would supply the world's requirements of potash for 250 years on the basis of the consumption in the last pre-war year. According to estimates made by Dr. Paul Kessler, the quantity of potash salts in Alsace amounts to nearly 1,500,000,000 metric tons, from which several hundred million tons of pure potash can be extracted. Before the War Germany exported potash salts to the value of about 100,000,000 marks (\$23,800,000 at normal exchange). This exportation will undoubtedly be multiplied in the next few years in consideration of the enormously increased world demand.

FROM OUR OWN CORRESPONDENTS IN THE FIELD

ARIZONA

NEW SHAFT OF COPPER QUEEN PROGRESSING—SALE OF PROPERTIES OF THE SHANNON COPPER CO.

BISBEE.—Subsidence of the ground around the hoist at the Czar mine, causing cracks to appear in the surface, has caused the Copper Queen branch of the Phelps Dodge Corporation to announce that the hoist is to be leveled. The Czar is one of the oldest mines in the Warren district. The Holbrook shaft, adjoining the Czar, is several feet out of alignment but this will not require immediate adjustment. During the time the Czar hoisting equipment is being leveled, men will be lowered through the Holbrook and the Queen incline.

The new Southwest shaft of the Copper Queen is progressing rapidly. It is being raised from the third level of the Southwest workings to the surface, a distance of about 700 ft. The collar will be between the present office of the Southwest mine and the Uncle Sam shaft. The raise is being carried on simultaneously on the third and seventh levels, while station-cutting is in progress on other levels. The present Southwest shaft extends from the Czar 200-ft. level to the sixth level of the Southwest, and is equipped with an underground electric hoist on the fifth level. Hoisting is done through a five-foot compartment, equipped with a single-deck cage. For several years there has been no mining below the third level, while operations on the upper levels have extended several thousand feet from the present shaft. The new shaft will eliminate long hauls and provide adequate hoisting equipment; it will consist of one large hoisting compartment and a smaller compartment for a manway.

A drift is being driven from the Gardner 1000-ft. level toward the Czar and Holbrook, and will be of value in exploring the vertical extent of the orebodies in the Holbrook and Czar zones. The heading of this drift has advanced to a point 2000 ft. from the shaft. The ground being explored is 400 ft. below the lowest workings of the Holbrook and 600 ft. below the lowest Czar working. The face of the drift is in the lower limestone, below the usual ore horizons of the district, so its progress is being watched with much interest. At the Lowell shaft of the Copper Queen interesting work is under way on the 1300-ft. level, re-opening part of a large orebody, originally encountered several years ago, but abandoned on account of fire. The sulphide ore was ignited by means of heat generated by friction caused by ground movement and it became necessary to seal off a large area by concrete bulkheads. Water also has been kept constantly running

through the fire zone and it is now possible to recover a large tonnage of high-grade ore. This will be accomplished by construction of concrete bulkheads and carefully planned fire-doors to control gases from that part of the orebody where the fire still is active. On the 1400-ft. level of the Lowell two new drifts have been started, one heading toward the Gardner shaft, and the other below the known orebodies on the 1300-ft. level. Connection between the Lowell and Gardner already has been made on the 1000, 1100, and 1200-ft. levels. The 1300-ft. connecting drift has been under way for some time, and with the new 1400-ft. connecting drift it should determine the extent of a large body of sulphide ore that already has been stoped to a vertical depth of several hundred feet. The other 1400-ft. level drift is at present in primary sulphide ore that probably connects with the known orebodies on the level above.

A winze is being sunk from the 1600-ft. level of the Sacramento shaft to the 1800-ft. level, 200 ft. lower than the present deepest workings of the Copper Queen. Directly over the collar of the winze a raise is being extended to the 1500-ft. level, giving the completed winze a depth of 300 ft. The winze consists of two vertical shaft-compartments, one for hoisting, the other for piping, manway, etc. It will be equipped in the 1500-ft. level with machinery for hoisting to handle supplies and waste from prospecting work. This work is being carried on as part of the plans for the new haulage system having the Dallas shaft as an outlet. This will be in operation by the time steam-shovel operations on Sacramento hill make abandonment of the Sacramento shaft necessary. The Sacramento shaft at present handles almost the entire tonnage from the Copper Queen mines. By the time the winze has been completed to the 1800-ft. level, the Dallas shaft also will have been sunk to that depth. By driving from both shaft and winze the time required for connection will be cut in half. Besides acting as a haulage-way, the new drifts will furnish a base for prospecting and developing orebodies below the 1600-ft. level of the company properties, about which little is known at present.

CLIFTON.—It is understood here that the sale of the properties of the Shannon Copper Co. was completed at a meeting of stockholders, held in Boston, Massachusetts, October 7, the purchaser being the Arizona Copper Co. As a quorum was not present at the regular stockholders' meeting the adjourned meeting in Boston was called. The exact figure in the deal is not made public, but it has been stated in authoritative quarters that after liquidating all obligations the Shannon company will have left a

balance of about \$450,000 to be used in development of its mines at Gleeson, Cochise county, and Yeager canyon, in Yavapai county. The Yeager property has shown some rich ore but still is in a problematical stage. The Gleeson property, which cost the company \$80,000, has sufficient showing to warrant it being valued at \$600,000 at the present time, and ore from this property has been used by the Shannon for a considerable period to carry on its operations. According to Nathan L. Amster, president of the Shannon Copper Co., the sale of the Clifton-Metcalf property to the Arizona Copper Co. marks the parting of the company with the least valuable of its holdings. The Gleeson property has large bodies of low-grade copper, but it is believed sufficient reserve will be developed there to warrant the establishment of a mill and smelter. J. W. Bennie, general manager for the Shannon company, now is at Gleeson, pushing development work.

COLORADO

ASPEN, CARIBOU, LEADVILLE, CRIPPLE CREEK.

Universal interest in the search for petroleum sustains efforts at discovering new oilfields in Colorado. Search is being made in various parts of the State and wells are being drilled in territory even that has been unfavorably passed upon by the State Geologist. A good many wells have been drilled in Rio Blanco county, north-western part of the State, by subsidiaries of large oil companies, and rumor states that these wells are carefully capped when completed, the inference being that good results have attended the drilling of a good proportion of such wells, production from which must await completion of refineries and the building of railroads. Recently wild-cattling is being done along the valley of the Fountain river between Colorado Springs and Pueblo, there being confidence among certain oil-men that the geological conditions are there analogous to those that furnish petroleum in commercial amounts at Florence and Boulder.

In the case of certain demands made by about six hundred smelter workers of Pueblo upon the State Industrial Commission, this commission granted wage increases of from 25c. to 40c. per shift, but rejected several demands such as recognition of the union, time and a half for overtime and holiday labor (based upon the eight-hour shift), weekly paydays, the establishment of seniority rule in hiring and discharging men, the abolition of physical examinations required by employers, and the abolition of the contract, bonus, and additional-pay plan practised by the Pueblo smelter.

ASPEN.—After a long period of quiet, this district is receiving considerable notice through occasional strikes of silver ore. As is well known, Aspen is famous for its rich silver mines of the past. Some time ago we learned of a splendid find in the old Oakland property and the report was substantiated. Recently attention has been directed to a strike in the Mary B., one of the oldest claims in the district. These finds have done much to revive interest in this area and the prospecting of both old and new properties is being pushed vigorously.

SAWPIT.—The Colorado Vanadium Corp. is rapidly completing its new mill near Sawpit, a few miles northwest of Telluride, and expects to be operating very soon upon vanadium ores from its extensive holdings in the vicinity. The ore occurs in sedimentary beds on cliffs.

CARIBOU.—This district, in which the first discovery of silver in Colorado was made in 1869, after submitting to adverse metal-market conditions for many years, is showing substantial activity. The Caribou mine itself, with a production record of \$7,000,000, is being worked by numerous sets of lessees, the Potosi mine is shipping regularly, the Congo Chief is continuing its deeper development while saving a good grade of silver ore for anticipated higher prices for the metal, and many prospects are being worked. During slight excavation work within the town of Caribou, in that portion that was burned to the ground years ago, a vein of silver ore was recently disclosed. The Grand county group is being equipped with a small electrically driven surface plant. In the Ward district, a few miles north of Caribou, Ewing & Company have completed and begun the operation of a new concentrating mill that handles run-of-mine ore from the famous White Raven mine, strictly a silver producer.

LEADVILLE.—One of the first complications to arrive out of the recent decision by Judge Hersey in the district court at Leadville regarding the moving of the boundary line between Lake and Summit counties is over the collection of taxes for the year 1919. All tax assessments for this year on the molybdenite properties at Climax were made by the Summit county officials. Since the court decision the attorney for Lake county advises the assessor for that same county to effect a transfer of the assessments from Summit county to Lake county. Before attempting such proceedings, however, the Lake county assessor referred the matter to the State Tax Commission, which in turn referred it to the State Attorney-General. This last authority renders the opinion that the present tax assessments may not be interfered with for the year 1919, especially as the case is not settled for good, it being probable that it will be re-tried. Litigation may continue to affect these tax affairs for a long time, since Summit county will not quietly relinquish valuable land that it has held without previous dispute since pioneer days.

CRIPPLE CREEK.—Predictions made by many early prospectors of the Cripple Creek district seem recently to have been given some degree of substantiation. This refers to a surface discovery on Carbonate hill, which borders the rim of the great crater on the north. A portion of the hill is breccia, but the greater portion is granite. One or two mines on the southern side have produced ore. Just as mineral values were found to extend outward from the crater into the adjacent country rock (granite) to the south in the Independence mine and also, in lesser degree, at other points around the rim of the crater, it may be that developments in Carbonate hill will disclose considerable orebodies.

The old and well-known Isabella mine, during the

active speculation that formerly prevailed in Cripple Creek stocks, was for years used as the basis for numerous stock-jobbing schemes. Owing to the relative inactivity of this mine for some time past, a movement has been started by stockholders to interest a sufficient number of such stockholders in the proposed Isabella Leasing Co., to be capitalized at \$25,000 with shares at one dollar par. Capital derived from disposal of this stock will be devoted to development of new ground. Ore produced by the leasing company will be charged royalties ranging from 8% to 30%, depending upon grade of shipments.

KING INCLINE, ARIZONA COPPER CO., METCALF, ARIZONA

MICHIGAN

POSSIBILITIES OF RECOVERING COPPER FROM OLD SMELTER SLAG.—DEVELOPMENTS ON THE MAYFLOWER LODE.

Experiments made at the Michigan College of Mines show that it is possible to save copper now lost in the slag that is run to waste from the smelters operating in the Michigan copper district. The slag of the Quincy Mining Co.'s smelter, at Hancock, has a copper content of 22 lb. per ton. There is 100,000 tons of slag on this dump. Experiments performed on this slag show that 18 lb. is metallic copper, recoverable with practically no

difficulty by ordinary wet concentrating methods, after being ground. Similar experiments conducted on the slag of the Michigan Smelting company, which treats the product of the Champion, Trimountain, Baltic, Wolverine, Mohawk, Michigan, and other mines, and with the slag at Hubbell, where is situated the Calumet & Hecla smelter and the furnaces that treat the product of the subsidiaries of that corporation, illustrate a similar saving is possible, although the untreated slag does not contain quite so much copper. In the slag pile at Dollar Bay, not now in operation, but containing the accumulations of years from the old Lake Superior Smelting Co., 20 lb. of copper per ton is averaged. It is not to be understood that any such losses in copper now are permitted; on the contrary, refining has been improved to such an extent that it is doubtful that further improvement is possible. The old slag piles, however, were formed from blast-furnace operations in the days when copper-smelting was not as well understood and requirements were not so exacting as they are at the present time. These slag piles are small in comparison with the great Calumet & Hecla sand pile, which today is yielding a larger profit per ton of material handled than any mine in the district; nevertheless their re-treatment offers attractive possibilities for profit.

From a geological standpoint the developments in the shaft at the Mayflower-Old Colony property present interesting chances for speculation. The formation in the shaft at 1560 ft. proves that the lode was cut at 1403 ft., an assumption that could not be verified previously. Shaft-sinking will continue to 1700 ft.; then the lateral work on the lode will start in two directions at 1403 ft. The confirmation of the theory that the Mayflower lode was cut at 1403 ft. indicates possibilities that copper may be found outside of the accepted limits of metal formations in this district. In addition to the expectation of commercial success for the Mayflower corporation itself, the work is likely to stimulate exploratory operations for such properties as the St. Louis and the Centennial, both of which carry the same formation. The shaft openings prove the flatness of the lode and make it, from present indications, a mining proposition that will be easily handled. The so-called Mayflower lode was opened in two places with the diamond-drill, one at 1400 ft. and one at 1700 ft., the lower opening being the richer. The drill results showed faulting, which is confirmed by the shaft work.

The close association of mining and taxpaying is illustrated in the case of the Baltic Mining Co. v. the Township of Adams, County of Houghton, argued before the Supreme Court of Michigan last week and likely to be decided in the near future. The case was started when Fred W. Denton was general manager for the Copper Range Co., of which the Baltic is a subsidiary. Mr. Denton started the suit as a protest against the taxes levied against the Baltic. Mr. Denton was not only manager of the mine but supervisor of the township. The case was won by the township in the local circuit court and was appealed by the mining company. As super-

visor of the township Mr. Denton had to arrange for the defense of the suit as well as the prosecution. The case is looked upon as friendly to determine the justice of the taxation methods employed in the county of Houghton, where valuations for mining properties are reached through the utilization of the stock market figures of the Boston exchange.

NEVADA

SHAFT OF FAIRVIEW EXTENSION INTERSECTS GOOD ORE.—
CRACKER JACK TO BE GIVEN LEASE ON PART OF FLORENCE DIVIDE BLOCK.

ROUND MOUNTAIN.—The shaft of the newly organized Fairview Extension company at a depth of 65 ft. is in ore assaying over \$25 per ton. A hoist and air-compressor are in place and the power-line has been completed. The Extension claims adjoin the Fairview and the shaft is one mile from the Fairview mill. The Sunnyside mill is working on ore produced by lessees, who recently secured an extension of their leases to January 1, 1920. Two Huntington mills are being operated two shifts and are treating 20 tons of high-grade ore daily with an extraction of 98%. The grade of ore being treated makes it necessary to run the mills slowly. The Fairview mill is operating 6 stamps, using three shifts, and is treating 30 tons daily, the usual amount. Quartz of promising appearance has been found in a drift driven 100 ft. south-east from the bottom of the 250-ft. shaft. Placer mining has been discontinued for the winter and a new pipe-line is being laid for increasing the output next season.

TONOPAH.—According to reports the Cracker Jack is to be given a lease on part of the Florence Divide block by the Florence company after January 1. The Cracker Jack is to secure territory near the Florence Divide stopes and on the strike of the vein and it is understood the remainder of the lease will be renewed to the Florence Divide if application is made, but on terms that will provide for more development work than has been done in the past. As far as can be learned the Cracker Jack lease will be on territory entirely outside the Florence Divide ore-shoot.

ARROWHEAD.—What is believed to be the extension of ore found on the 100-ft. level of the Arrowhead has been opened in the east drift on the 175-ft., or bottom level. The material assays \$200. Six feet of ore is exposed in the west drift on this level and ore assaying over \$2000 per ton is being mined in the winze from the east drift on the 100-ft. level.

GOLDFIELD.—On November 1 repairing of the Great Bend shaft was started. It is estimated this will require one month and during the period no development work will be done.

NEW MEXICO

INCORPORATION OF THE LONE MOUNTAIN SILVER MINES CO.—
DISCOVERY OF SILVER-LEAD ORE AT DEMING.

LONE MOUNTAIN.—Lone Mountain Silver Mines Co., owning eight claims between Chino and Tyrone, and

three miles from the Hurley concentrating plant of the Chino Copper Co., recently was incorporated under the laws of New Mexico for \$150,000, shares having a par value of 10 cents. One-third of the ownership stock is held in escrow while the remainder will be used as a development fund. Company offices have been established at Deming, New Mexico, in charge of H. W. Loomis. Officers of the company are C. A. Overlock of Douglas, Arizona, president; D. A. Richardson, secretary; H. W. Loomis, treasurer and manager. All three are directors. The incorporation of the company marks a step in an attempt to revive this once rich silver mining district, where mining has been done intermittently since 1860. Pinos Altos had about 100 men washing gold when the Civil War broke out. A ring of silver camps, once active but closed down since the silver slump of the early '90s, surrounds Lone Mountain within a radius of 20 miles. These include Georgetown, Camp Fleming, and the Bre-men mines at Silver City, which made that place, as well as a number of less notable ones. All these mines produced high-grade silver in bygone days. Few, if any, had any real development work done; the old-timers gouged out the ore where it was exposed at or near the surface. Lone Mountain was classed as a rich producer of this type, having given up many thousands of dollars worth of ore from surface pockets. Reasoning from analogy with mining camps of South America and Mexico, particularly in the latter country, and based upon reports of the U. S. Geological Survey, the Lone Mountain company has decided to explore its property at depth on the main porphyry intrusion into the lime, where large quartz bodies indicate a continuity that the small pockets in the lime do not show. The shafts will be dry to reasonable depths and sinking will be inexpensive in the soft porphyry. No timber will be required beyond the collar at the surface. There is a good truck-road from the Hurley station to the mine. Mr. Loomis first owned the ground in 1884, but later abandoned it, until recently when he had an opportunity to recover it.

DEMING.—A discovery of silver-lead has been made in Tres Hermanas mountains between Deming and Columbus. Details of the strike are lacking except that the property on which it was made adjoins that of J. A. Mahoney of this city.

LORDSBURG.—The 85 Mining Co. has been replacing part of its power-plant equipment of Diesel engines with steam-turbines in preparation for starting up its mill after a long shut-down. The company continues to ship its high-grade ores to the C. & A. smelter at Douglas for reduction.

GOLD HILL.—A company has been organized by Mr. Lorenz and other El Paso business men to operate this old property, lying between Lordsburg and Silver City. No definite announcement of plans has been made, although it is understood an extensive development campaign is planned and operations on a limited scale have been started.

WHITE SIGNAL.—Numerous location notices have been filed in the district surrounding here and extending east

to Lone Mountain and north to Tyrone. Many of the properties taken up are former silver producers which with silver-prices at their present level can be made to produce at a profit. Re-opening some of the old producers is assured in the near future. Mining men investigating this district have laid special stress upon the possibility of low-grade orebodies, neglected by the old-time miners, but which with modern mills could be made to pay handsomely.

UTAH

EFFECT OF THE COAL STRIKE.—ACTIVITY IN THE TINTIC DISTRICT.

SALT LAKE CITY.—Impending labor trouble in the coal mines of the State is already affecting the metal-mining industry. In several of the metal-mining camps operators

time operations and do everything possible to keep the people of the State supplied with fuel. Hardon Bennion, Secretary of State, and acting Governor during the absence of Governor Bamberger, said the State officials are fully cognizant of the possibilities of the situation and are keeping in close touch, and that the State authorities will lend their support toward keeping the mines in operation, and are making preparations to meet any emergency.

ALTA.—Approximately three feet of snow fell here during the storm of October 25 to 27. Mining operations have been seriously hampered and the Little Cottonwood Transportation Co.'s railroad, which transports ore to the valley smelters, was completely tied up for several days. Operations were recently resumed at the Cottonwood Metals mine in Big Cottonwood canyon. An adequate supply of materials has been laid in for the winter, and

(Photo by Tume, Goldfield)

THE MAIN SHAFT OF THE GOLDFIELD DEVELOPMENT CO., GOLDFIELD, NEVADA

have been notified that practically all the railroad cars will be sent to the coal mines during the last week of October and that but few cars will be available for hauling ore. This order has already cut in heavily on the output of the Tintic and Park City mines in particular. If the strike should spread to western coal mines, it is more than likely that it would eventually tie up the smelters and then in turn all the producing mines. Railroad representatives in some of the camps have notified the mine operators that only such cars as are sent into the districts loaded will be available for the shipment of ore, and there is even a likelihood of these cars being hurried back to the coal mines instead of being used in moving ore to the smelters. It is stated that the coal mines of Carbon county employ about 4000 mines, 25% of whom are organized, while labor leaders state 50% are organized. Coal operators held a meeting with Federal and State officials in Salt Lake City on October 29, at which it was decided that the mine operators will con-

development work will proceed without interruption. This company owns 32 claims in the heart of the Big Cottonwood mining district. The main adit is now in 1071 ft., and has already cut four fissures. At present a drift is being driven to follow a promising shoot that was uncovered in one of the fissures. Samples from this shoot average \$55 per ton. The vein will be followed until the intersection of the fissure with the lime-quartzite contact is reached. The company is employing two shifts per day, and if no unforeseen contingencies arise to prevent steady work before the winter is over, several of the most important fissures should be cut by spring.

BINGHAM.—Announcement has been made that the Bingham & Garfield Railway Co. has taken over from the Denver & Rio Grande Railroad the ore-hauling contract which the latter road has had with the Utah Copper Co. for a long period. The contract the Rio Grande company had with the Utah Copper Co. provided that the Copper company deliver to the railroad company 7500 tons of ore

per day for transportation to the Magna and Arthur plants. Coincident with this announcement it was stated the Rio Grande would reduce its forces 30 men at Bingham and 70 at Welby. The above arrangement is temporary and was made for the purpose of giving the Rio Grande more cars for the hauling of sugar beets and coal. The Bingham & Garfield Railway is now handling practically all of the ore from Bingham mines to the valley mills and smelters.

EUREKA.—There is considerable activity in the eastern and southern parts of the Tintic district at present, no less than 20 new shafts being sunk. At the Little May property in South Tintic, new equipment has been installed and a depth of 130 ft. has been reached. At the Alaska property, immediately adjoining, a discovery of ore was recently made, carrying from 30 to 200 oz. in silver per ton. Good progress is being made in the erection of a new hoist and electric motor at the East Tintic Coalition mine. The compressor has not arrived, but is expected daily, when mining operations will be started. The Eureka Bullion is putting in a water line which will connect with the line supplying the Eureka Lily and the Big Hill properties.

Shipments of ore from the district for the week ended October 24 totaled 120 cars. The shortage of cars, caused by the sugar beet and coal traffic, is now being felt by all of the large producers.

A new station is now being cut on the 1450-ft. level of the Tintic Standard mine, this being the preliminary step toward the development of the big ore-deposits at an additional depth of 100 ft. As soon as the station is completed, at least two drifts will be started for the purpose of getting beneath the present large stopes. The ore that was recently found a short distance toward the south-east of the shaft on the 1350-ft. level is responding splendidly to development work, and is now one of the mine's largest stopes. Officials are much pleased with recent developments, and by the time the railroad spur reaches the mine, all the new equipment, including a large compressor, will have been placed in running order. This mine is the second largest silver producer in the State, and one of the heaviest lead producers.

PARK CITY.—Shipments of ore from local mines to Salt Lake valley smelters for the week ended October 24 were as follows: Ontario Silver, 485 tons; Silver King Coalition, 442 tons; Judge M. & S. Co., 110 tons, Silver King Consolidated, 55 tons; and Daly Mining, 54 tons. There has been an unusually heavy fall of snow, which has seriously interfered with mining and development operations. The impending coal strike has also resulted in shortage of cars for ore loading.

At the Iowa Copper property, excellent progress has been made with the installation of new equipment. The contact has not been cut as yet, but from indications it cannot be far distant. Development work at the Glenallen property is yielding encouraging results. In the main tunnel winze, which was recently unwatered, from 5 to 8 ft. of ore has been opened up. The management is making every effort to complete the mill and is confident

that operation will begin before severe weather sets in. At the Park-Utah mine development is progressing satisfactorily. On the south drift, three fissures have been cut, the intermediate one being highly mineralized.

WISCONSIN

GENERAL NEWS OF THE DISTRICT.

HIGHLAND.—The Saxe Mining Co. of Milwaukee, operating the Lampe mine, has resumed operations after a shut-down of more than six months. Low markets compelled the suspension of mining operations. The Saxe management recently disposed of several hundred tons of zinc carbonate ore carried in bins since the shut-down, and a force of miners has been returned to underground work.

LINDEN.—Two new companies are engaged in this district, after a shut-down lasting several months. The Fearless Mining Co. has been incorporated with a capital stock of \$100,000. The incorporators are Frank Harker, Huntington & Weller, Jos Piquette et. al., of Platteville. A new 100-ton mill has been completed and is in action. The main orebody is opened on a working face 60 ft. wide with sides undetermined, and from 8 to 10 ft. in thickness, all high-grade 'jack'. The first recoveries, in milling, show a concentrate assaying 55% zinc from the jigs. The Mackay Mining Co., recently incorporated, has taken over the holdings of the Ross Mining Co. The incorporators are D. Mackay and W. MacKay of Platteville, and J. Dunlavy, of Milwaukee. The Ross equipment has been put in shape for milling and men are at work underground driving to recently discovered zinc deposits on the W. Vial land, adjoining the Ross fee, to the east.

MINERAL POINT.—The Mineral Point Zinc Co. has enlarged its operating program, heavier buying of zinc ore from independent operators featuring recent business. Receipts of raw ore run about 40 cars of zinc concentrate weekly. The reduction works treating these ores operate on constant schedule, and from 500 to 600 tons of premium-grade blende is shipped weekly to the smelters of the Mineral Point Zinc Co. at DePue, Illinois. Large shipments of zinc oxide are made weekly and deliveries of from 3 to 5 cars of commercial sulphuric acid leave the works frequently. The company's leading producers in the field are the zinc carbonate mines at Highland; the Hoskins and Penna-Benton, at New Diggings; the Coker No. 1, at Livingston; and the Marsden mine at Pilot Knob, south of Galena, Illinois. These mines average from 25 to 30 cars of zinc ore weekly.

PLATTEVILLE.—The Block-House Mining Co. (Kistler-Stephens, proprietors,) have on hand 30 cars of high-grade blende, 4 cars of which were marketed on October 27 to the American Metal Co., Langeloth, Pennsylvania. About 1000 tons of green concentrate is held in bin awaiting treatment. The mine and mill have been shut-down for several months. The recent upward trend of the ore market has encouraged operation and the plant is ready to resume work on short notice.

BENTON.—Deliveries of zinc ore from this district, at

this writing amount to 35 cars of raw ore weekly, most of which is diverted to the uses of the reduction works in the immediate vicinity. Leading producers are the Champion mine, owned by the Wisconsin Zinc Co., with an average of 9 cars of zinc ore weekly, and the Hoskins mine, owned by the New Jersey Zinc Co., with from 7 to 10 cars weekly. The Frontier Mining Co., another of the active mining corporations engaged in this district, is reporting weekly deliveries from the Bearcat, Bull Moose, and Middle mines. The Skinner Roasters, operated by the Wisconsin Zinc Co. for the treatment of low-grade concentrate, are running night and day. Deliveries are made in open market to the highest bidder and run from 10 to 15 cars, premium-grade blende, weekly, receiving top prices for zinc ore paid in this field. Recent assays of ore converted at this plant run as high as 63% zinc. Attempts by agitators, representing the I. W. W., to organize the miners of the district met with signal disaster. Local authorities took an active hand in the prompt removal from the field of these disturbers, and those who contributed to the I. W. W. and subscribed to its policies were promptly dismissed. Public sentiment in the district and among the native miners is strong against interference. They feel that the workmen are well paid and have good hours and working conditions, and that they require no outside assistance.

BRITISH COLUMBIA

TRANSPORTATION DIFFICULTIES IN THE SALMON RIVER DISTRICT.—NEW SHIPPERS TO THE TRAIL SMELTER.

STEWART.—The survey of the proposed Government extension of the Premier wagon-road to the Big Missouri mine has been completed, according to James P. Suttie, who had charge of the work and has returned to Stewart. It is expected that the work will be started early next season and that it will be completed during the summer. This will facilitate the shipment of ore by such properties of the Salmon River district as the Big Missouri, Forty-Nine, Unicorn, and others. While there may be trial shipments from some of these properties this winter it is not thought that much ore will be sent out. The only regular shipper in the district this winter will be the Premier. It is understood that snow motors now are being built for the company and that they will arrive soon. Just how much ore it is planned to ship is not known but there is a considerable quantity on the dump. The Premier road is almost completed and when the snow comes it will be in first-class condition compared with that of last year over which two shipments were made, the returns from which totaled \$168,000.

A small shipment of high-grade ore has arrived at Hyder, Alaska, which is close to Stewart, from the Forty-Nine mine. It is said to rank among the finest ore the district has produced and is expected to average \$1000 per ton. H. Howson, who is in charge of the work, is enthusiastic with the showing developed. The diamond-drill work, now in progress, is reported to have demonstrated that the Forty-Nine is likely to become a producer of importance.

The mineral zone of the Salmon River district is handicapped because of its situation. The rugged mountain range dividing Alaska from British Columbia forces the export of ore through American territory to Stewart, whence it is loaded for the smelters or concentrators. Representations have been made to the Canadian government that a railroad be constructed to provide a ready outlet for the mineral riches of the country. The reply, it is understood, has been that it is impracticable to build such a road because, as matters stand, it would mean that part of the road would have to traverse American territory. Naturally, on the other hand, the American government would be scarcely likely to undertake the work to take care of a Canadian output. Consequently the project, which is considered of first importance to prospectors and mine operators, has fallen back to the shoulders of the latter and everything possible is being done to induce Sir Donald Mann, who is interested in the Big Missouri, and his associates to take up the task and to make a start next year.

ALICE ARM.—Shipments from the Dolly Varden mine to the Anyox smelter of the Granby Consolidated Mining & Smelting Co. have been closely inspected by mining men at Anyox, who are reported to be favorably impressed. It is felt that the Alice Arm district of British Columbia has an assured future as a mining centre. Important developments are looked for with the completion of the plans of the Taylor Mining Co. in regard to its railway which, it is understood, is to be extended to the Wolf mine, another silver producer some distance farther inland than the Dolly Varden. The railroad now is handling a limited quantity of ore daily, but with additions to the rolling stock and general improvements its tonnage capacity will be materially increased.

STUMP LAKE DISTRICT.—In the course of the last few months this district has been visited by Charles Camsell, of the Canadian Geological Survey; Mr. Weck, a mining engineer connected with the Bunker Hill & Sullivan Mining & Smelting Co., operating in the Coeur d'Alene, Idaho; and other mining men. Interest centred chiefly in the work of the Donohoe Mining Corporation in the unwatering of the Joshua mine workings and the provision of the equipment necessary to place the property on a producing basis. The old Mary Reynolds mine, on which development work has been in progress for some time under the supervision of R. R. Hedley, also was inspected. With reference to the Joshua mine it is announced that the first mining operations will be on the 300-ft. level, water now having been cleared to a depth of 380 ft., and that shipments are expected to be made before long. As to the Mary Reynolds it is stated by Mr. Hedley that the showings are encouraging. He has made a shipment of 45 tons to the Trail smelter and asserts that the new road to the property, in the construction of which financial assistance was tendered by the Provincial government, has resulted in a considerable economy in the matter of transportation.

TRAIL.—No fewer than six new properties make their appearance in the last list of ore receipts at the Trail

smelter of the Consolidated Mining & Smelting Co. of Canada. With the exception of the Sovereign, which is one of the properties operated by Clarence Cunningham in connection with his reduction plant at Alamo, B. C., all the new shippers are for the time being minor properties under development, and all qualify in the silver-lead-zinc category. The list includes the Freddie Lee, which is being developed by A. W. McCune, and the Ocean at Sandon, the Little Phil and the Tariff, at Ainsworth, and the Zineton in the silver-lead-zinc belt of the Sheep Creek district.

GRAND FORKS.—The Molly Gibson Mining Co., operating about four miles from Paulsen, has intersected ore assaying from \$48.50 to \$125 per ton in the lower tunnel of its workings. There is 60 ft. of stoping ground and the work of development is proceeding energetically. It is understood that steps are being taken to provide transportation facilities, it being the intention to start regular shipments as soon as possible.

MANITOBA

THE PAS.—There has been considerable activity in this district of late, due to the new finds on Copper Lake and the probability of the Flin Flon sulphide mine starting operations this coming winter. Several engineers have been at Flin Flon planning underground development work to check up the diamond-drilling which was done during 1916 and 1918. It is understood that Hayden, Stone & Co. interests have taken the option. To proceed further after checking up drill-holes would mean a 72-mile railroad from The Pas, about 35 miles of electric power line and a smelter for the massive sulphide ores. At Herbe Lake the property of the Northern Manitoba Development Co. has been sold. This property has a mining plant installed and two years ago shipped two carloads of high-grade ore to the Trail smelter. From the Mandy mine, 8000 tons of ore was hauled over the ice last winter to the head of navigation at Sturgeon Landing. From there it was floated down to The Pas on barges last summer, and shipped to the Trail smelter. Due to low water on the Saskatchewan river 9000 tons more had to be left at the head of navigation until the next open-water season.

ONTARIO

**PORCUPINE MINES RUNNING WITH REDUCED FORCES.—
ACTIVITY INCREASING AT KIRKLAND LAKE.**

PORCUPINE.—The Dome Mines with a staff of less than 300 men is working at about two-thirds capacity and milling over 1000 tons of ore per day. The installation of electric haulage on the more important levels has greatly facilitated operations. The grade of ore being treated is understood to run about \$8 per ton. At the Dome Extension two stopes are being prepared on the 650-ft. level. One of these stopes shows the width of the vein to be about 100 ft., and the other somewhat less. Development shows the orebody to be of greater length than at first supposed and the gold content is now estimated at \$6 per

ton. The working force of the Hollinger Consolidated has decreased to about 1000 men, resulting in a lessening of the tonnage treated to about 2000 tons daily. In order to meet the difficulty resulting from labor shortage it has been decided to install shoveling machines. The central shaft has been deepened to 1150 ft. and No. 11 shaft, which is being sunk to 2000 ft., taps the old McIntyre veins on the south side of Pearl lake. At the McIntyre men are also leaving, tempted by the high wages to be obtained in the lumber camps and recourse will also be had to mechanical shovelers. R. J. Ennis, general manager, spoke in a highly optimistic vein at the annual meeting on October 24, stating that since the issuance of the annual report the ore-shoot opened up on the 1125-ft. level, 920 ft. long had been proved to be 30 ft. wide; with ore averaging \$18 per ton. The total ore-reserves would average \$13 per ton, in place of \$10 as previously estimated. He expressed the opinion that the main horizon of enrichment had not yet been reached and that commercial ore would be found at much greater depth. Porcupine would before many years be recognized as a deep-mining camp. The main shaft on the Clifton-Porcupine is being sunk from the 100-ft. to the 200-ft. level. High-grade ore has been found on three veins at the 100-ft. level. At the Dome Lake a stope opened up on No. 3 vein between the 500 and 600-ft. levels shows a width of 9 ft. with an average gold content of \$12.

KIRKLAND LAKE.—Activity is steadily increasing with the return to the district of many of the former employees who had left on account of the strike. The mill of the Lake Shore is running at capacity on ore from the dumps. As soon as unwatering of the lower workings is completed the main shaft will be sunk from its present depth of 400 ft. to 600 ft. The company has paid a dividend of 2½%. The mill of the Kirkland Lake resumed operations this week, using ore from the dumps. The Crown Reserve has recommenced work on the Canadian-Kirkland property, and the Ontario Kirkland has completed its arrangements for the resumption of activity. Exploration work on the Bidgood property three miles east of the Tough Oakes has opened up several well-mineralized veins.

COBALT.—The daily production of silver by the Cobalt mines is estimated at upward of \$40,000 in value, with every prospect that the output will continue at this rate for some months at least. The court has ratified the agreement under which the Bailey Cobalt will be merged with the Northern Customs Concentrator in a new company to be known as the Bailey Northern Customs, Ltd. The Bailey shareholders will receive one share in the new company for each ten shares of their present stock. As there was a large tonnage of ore blocked out when the mine closed down production will be resumed shortly. The Mining Corporation is preparing to resume operations on the Foster, on which it holds an option. The Kerr Lake during September produced upward of 60,000 oz. of silver. The Hudson Bay mill is treating about 60 tons of ore daily of a grade sufficient to yield a good profit. Patches of high-grade have recently been encountered on the lower levels.

SUSPENSION OF ASSESSMENT WORK

At the present writing, dispatches from Washington indicate that the attitude of Congress toward the five-claim limitation has been changed, and it now seems probable that this limitation may be removed. On November 1, H. J. R. 183 passed the House and was sent to the Senate. If adopted by the Senate, the suspension of assessment work for 1919 will apply to all mining claims, without restrictions as to the number that may be held by any single owner.

ARIZONA

Outman.—At a meeting of the board of directors of the United Eastern Mining Co. it was decided that after the October distribution dividends will be declared on a quarterly basis. Action with regard to the quarterly distribution on January next will not be taken until the January meeting of the directors. Owing to a strike the property was shut-down for a time in August. Operations were gradually resumed in September, and shortly after October 1 the property was again producing at its normal rate.

CALIFORNIA

Downieville.—Installation of hoisting and pumping equipment is proceeding at the Gibraltar mine, operated under bond and option by Dan McGonigal. Unwatering the 300-ft. shaft is to be pressed and production of gravel from the channel resumed. The lower tunnel is in 500 ft. and is expected to enter the main channel in the spring of the coming year.

Graniteville.—John Phelps has purchased from Thomas Staples the Lucky Strike and Lucky Strike No. 1 gold-copper claims in the Eureka district, and plans aggressive work. Ore of good grade is reported exposed.—The mill at the Spotswood is running on ore from the newly-discovered vein. The lode was uncovered in the main tunnel.

Grass Valley.—Active pumping operations are in full swing at the Idaho-Maryland. Over 500 ft. of the shaft has been unwatered. So far an air-lift has been installed and that method will be used as long as practicable.

The Sierra Asbestos Co., operating near Washington, is milling 100 tons of rock per day for the fibre content and shipping four grades by railroad. The company plans to double production by next year.

Nevada City.—A. D. Foote, general manager for the North Star Mines Co., and associates have taken under bond from Henry Goering and partners the Round Mountain gravel property, three miles north-west of Nevada City. A compressor and power-drills have been installed and driving of the old tunnel resumed with the purpose of intersecting two channels which yielded richly in adjacent territory.

Nevada County.—William Buholtz of Marysville seeks to foreclose a mortgage and have a decree of foreclosure issued against the Black Bear Mining Co. in the Rough and Ready district a few miles west of Nevada City. He holds a claim for \$17,529, and with interest the amount totals over \$23,000. The mine was a producer years ago but recent operations under company management have not been successful.

Plymouth.—Plymouth Con. Mines has established a sta-

tion on the 2700-ft. level and started cross-cutting to reach the vein developed on the 2600-ft. level and upper workings. Repairs to shaft are being made and reinforced concrete supports installed. James F. Parke is manager.

Quincy.—The Foundation Mining Co., of San Francisco, is completing arrangements for mining the bed of the Middle Fork of the Yuba river at Hartman Bar. It is proposed to divert the river around a side hill by means of a dam and flumes, exposing the river-bed for a length of 700 ft. and a width of 55 ft. Comprehensive drillings indicate the channel carries rich auriferous gravel 30 to 40 ft. in depth. Approximately \$80,000 is to be expended. Julius Becker, of San Francisco, is one of the principal owners of the company, and will manage the enterprise.

IDAHO

Big Creek.—With the increasing demand and high price for silver the mines and prospects of the Big Creek district of the Coeur d'Alene are attracting unusual attention. Ore is being shipped from the Big Creek Mining Co. and the Big Creek Leasing Co., the latter operating the Yankee Boy group, which has yielded more than \$100,000 in silver, lead, and copper. A concentrator capable of handling from 75 to 100 tons of ore daily is under construction for the Big Creek Mining Co. Another promising property in that region is the Sterling Silver Mountain group owned by Spokane and Kellogg men.

Wallace.—Two carloads of concentrates have been shipped from the mill at the Interstate-Callahan company. The product is zinc and goes to the Grasselli Chemical company. These are the first concentrates to be shipped from any of the big mines of the Wallace, Mullan, and Burke districts of the Coeur d'Alene since the mines were closed by the miners' strike. The company now has almost a full force of men in mine and mill. A few men are returning to the district each day.

NEVADA

Goldfield.—Driving has started from the 440-ft. level of the Reorganized Crackerjack to open the main orebody, which continues to show a 10-ft. face of \$18 ore, with seams running over \$21. Driving from the 330-ft. level to develop the East vein is also in progress.—The Conqueror and Sandstorm-Kendall, adjacent to the Crackerjack, are to be re-opened, according to reports current here.—Goldfield Development has increased the scope of activity on its lease on the north-half of Florence-Goldfield and reports 200,000 tons of excellent ore blocked out. Large-scale development of the adjoining Jumbo mine has been decided on.—Red Hill-Florence Co. is saving ore for shipment from the south drift on the 500-ft. level. Ore samples \$17 the full width of the drift, with an 18-in. streak assaying \$40. Six cross-cuts and drifts are prospecting territory owned by the company or leased from the Florence-Goldfield.

The Goldfield Consolidated has declared dividend No. 25 at a rate of 5 cents per share, payable on December 31 to stockholders of record November 30.

Reservation.—The Nevada Silver Mining & Development Co. has purchased the Dog group of claims in the Reservation district, 3000 ft. south of the V-7 group. The property

is traversed north and south by the V-7 silver-lead vein and east-west by five silver-gold veins. Veins assay \$7 to \$1200 at, or near, the surface. Arrangements are being made to install equipment, erect surface buildings, and drive a main working tunnel. W. G. Donald, manager for the Motor Finance Co., of Oakland, California, is president, and W. E. Casson, Carson City, Nevada, secretary. Chicago people are interested.—Elkton Divide Co. has been financed by New York people and is preparing to operate a lease on a rich part of the Reservation Hill group.

Oakland people have taken the Review group under bond and option. The property adjoins the V-7 on the south and contains the extension of the V-7 vein, the Golden Fleece lode, and a cross vein, the last assaying \$54 in silver at surface.—Comprehensive operations have commenced at the V-7 group under management of George L. Hedges. The property is controlled largely by Californian people and contains several orebodies, of which the V-7 silver-lead vein is the most prominent. A fair tonnage of shipping ore is in sight.

Tonopah.—Forty-six properties are operating in the Divide district, according to a statement by J. Grant Crumley, vice-chairman of the Tonopah-Divide Chamber of Mines. Many of the agitators have departed for other fields, and skilled miners are arriving daily. Most of the properties at both Divide and Tonopah are short-handed, but this condition is being steadily improved. The Southern Pacific Co. has discontinued its sleeping-car service between Reno and Mina, giving as a reason unsettled labor conditions in southern Nevada.

WASHINGTON

Spokane.—Spokane will ask for, and stands a good chance of winning, the 1920 session of the American Mining Congress. Delegates are named by the Northwest Mining Association to attend the 1919 session of the congress at St. Louis, November 17 to 22, and others will be named later by the association and by the Spokane Chamber of Commerce to make a fight for the convention next year.

BRITISH COLUMBIA

Salmon River.—Control of the Premier mine has been sold to the American Smelting & Refining Co. The announcement was made in New York that the consideration was \$5,000,000 or more. With the sale goes the management of the mine, which will be conducted from 120 Broadway, New York. R. K. Neill of Spokane and associates remain on the board of directors and retain some interest.

Trail.—The Consolidated Mining & Smelting Co. received 4157 tons of ore in the seven days ended on October 24, as compared with 4148 in the previous week. The receipts in detail follow:

| Mine | Gross tons |
|---------------------------------------|------------|
| Alamo mill, Alamo | 42 |
| Black Bear, Rossland | 591 |
| Centre Star, Rossland | 1652 |
| Canada Copper, Greenwood | 12 |
| Iron Mask, Kamloops | 55 |
| Josie, Rossland | 174 |
| Lone Pine, Republic, Washington | 258 |
| Laurier, Laurier, Washington | 30 |
| Mowitch, Alamo | 21 |
| Mandy, Le Pas | 394 |
| North Star, Kimberley | 246 |
| Ocean, Sandon | 3 |
| Providence, Greenwood | 31 |
| Quilp, Republic, Washington | 479 |
| St. Eugene (zinc), Moyle | 39 |
| Standard, Silverton | 68 |
| Union, Lynch Creek | 32 |
| Tariff, Ainsworth | 30 |

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

D'Arcy Weatherbe is at Vladivostok.
Percy R. Middleton is at Los Angeles.
L. K. Armstrong, of Spokane, is in Montana.
Charles A. Mitke, of Bisbee, is at Pachuca, Mexico.
Frank C. Loring, of Toronto, has been in London recently.
Harvey S. Mudd has returned to Los Angeles from London.
W. R. Degenhardt has returned to San Francisco from London.

F. M. Field has returned from Virginia City, Montana, to Los Angeles.

J. W. Jury has returned from Tavoy, in Burma, to Redding, California.

John Bland, formerly at Denver, is with Charles Butters & Co., at Oakland.

Charles H. White is in Arizona, and will not return to San Francisco until December.

H. R. Plate has gone to New York, and will return to San Francisco about November 25.

J. F. Mitchell-Roberts has returned from Korea and is now making a short visit to Los Angeles.

R. G. Hall, manager for the Burma Mines, has been in London, and is now returning to Burma.

W. E. Simpson has returned to North Hatley, in Quebec, Canada, after spending three months in Europe.

James A. Force, Major in the Field Artillery, has returned to Berkeley from France, after three years service.

Donald H. Fairchild has returned to Denver after examining properties in the Kingman district of Arizona.

J. Parke Channing passed through San Francisco last week on his way to Los Angeles, returning thence to New York.

John H. Farrell was in San Francisco last week on his way from Los Angeles to the Silver Mountain district in Alpine county, Colorado.

Welton J. Crook is returning to California, after having completed the erection of the Emerald mill for the Iron Mountain, Limited.

E. P. Mathewson has resigned from the directorate of the A. S. & R. Co., and has opened an office as consulting metallurgist at 42 Broadway, New York.

Henry C. Carlisle, general superintendent for the Nevada Wonder Mining Co., Wonder, Nevada, was in San Francisco last week, and has gone to Redding.

Sydney H. Ball has been made a Chevalier of the Belgian Order of the Lion, in recognition of his work in developing the mining industry of the Belgian Congo.

Louis S. Cates, general manager for the Ray Con. Copper Co. and assistant general manager for the Utah Copper Co., left Salt Lake City on October 30 for a two weeks inspection trip of the Ray properties in Arizona.

Kenneth Austin Mickle died at Melbourne, Australia, on July 31. He served in the British army in France and received the D. S. O. In the early days of flotation he won distinction for his research into the physics of the process.

THE METAL MARKET

METAL PRICES

San Francisco, November 4

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 65 |
| Antimony, cents per pound..... | 10.00 |

EASTERN METAL MARKET

(By wire from New York)

November 4.—Copper is inactive and lower. Lead is quiet and steady. Zinc is dull and firm.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

MONEY AND EXCHANGE

Foreign exchange continues weak, lire especially reflecting the present disordered conditions in Italy. Discussion of methods of rectifying the exchange situation forms the principal topic for discussion at Atlantic City, where at the International Trade Conference, American and foreign bankers are attempting to come to some understanding. Speaking before this conference, Dwight W. Morrow, of J. P. Morgan & Co., said in part:

"The great growth of our foreign trade has forced to the front a problem which vitally affects all the people of this country—the problem of international credits. Merchandise exports for the past five fiscal years ended June 30 were \$26,537,092,227. The excess of exports was \$13,963,975,827. These figures represent the balance of merchandise exports only. When all the items—visible and invisible—are taken into account, the balance must be paid in gold, or its payment postponed by extension of credit. The simplest way for such credit would be for the individual seller in this country to give credit to the individual buyer abroad. The boot and shoe manufacturer of Massachusetts might take the promise of his customer to pay at some future date. Such a theory is unworkable in practice to any large extent. The boot and shoe manufacturer has available for investment only his profits or savings. After he has invested his own savings in a foreign credit he must look about for some other person who has savings and get that person to buy his foreign customers' promises to pay. The manufacturer cannot stop manufacturing to look for the man with savings. He needs the co-operation of a banker—perhaps a thousand bankers whose names he does not even know. The international banker gathers up a thousand little rivulets of capital into one large stream.

"Excess of merchandise exports from July 1, 1914, to July 31, 1919, was approximately \$14,200,000,000. There were net exports of \$380,000,000 of silver. This made the enormous total of \$14,580,000,000. How was that balance settled? Approximately \$340,000,000 was paid by net imports of gold. Approximately \$12,190,000,000 was covered by credits. Of these, \$9,615,000,000 was loaned by the United States government to foreign governments and \$2,575,000,000 by people of the United States to foreign governments or enterprises. This leaves \$1,450,000,000 apparently settled by invisible items. No one believes we can continue piling up a balance of \$4,000,000,000 a year. Yet, with the War over, the excess of exports for the first seven months of the current calendar year was \$2,673,000,000, compared with \$1,693,000,000 for the same period in 1918.

"I hesitate to guess the foreign credits that will be required in coming months. Imports from Europe are increasing, rising from \$21,800,000 in January to \$58,600,000 in July. In no one month, however, have our exports to Europe been less than \$370,000,000 and in no month to July has excess of exports been less than \$340,000,000. If we assume Europe can reduce her purchases from the United States progressively by \$10,000,000 each month and increase her sales to us progressively \$10,000,000 each month, she will still owe the United States on merchandise balance approximately \$2,750,000,000 by next summer. If we assume that the net invisible items in favor of Europe will amount to \$750,000,000 by next summer, this would leave \$2,000,000,000 to be settled by imports of gold or extension of credits."

Eastern Metal Market

New York, October 29.

All the markets are inactive, due to the generally unsatisfactory labor conditions and the prospects of a coal strike.

Buying of copper has been only moderate and at a great variety of prices, depending on the seller and the quantity, delivery, etc.

The longshoremen's strike at New York dominates the tin market, where nearly all the buying has been for spot delivery at distinct premiums over other positions.

The lead market is very strong and prices have again advanced with some prospects of higher prices later.

Demand for zinc is light but the prices are stationary and the market may be characterized as firm.

Antimony is slightly higher and stronger in a quiet market.

IRON AND STEEL

The prospect of a coal strike has sharply accentuated market conditions produced by the steel strike. There has been heavy buying of pig-iron on advances reaching \$2 per ton, and in some cases more. Coke has advanced \$1 to \$1.50 per ton in a scramble of buyers and active demand has appeared for finished steel products, rendering more general the present scarcity already caused by the steel strike. As to the strike, Pittsburgh mills are working with practically the same forces as a week ago but gains have been made at Youngstown, Cleveland, and Chicago. A growing scarcity of cars in all districts is due to the order restricting the use of the gondola types to coal traffic and ore movements are suffering. More consumers of finished steel have come into the market for fear their operations may suffer for lack of material. Where steel billets either for forging or rolling can be had on new orders the price is \$5 per ton above the so-called schedule, \$43.50 at mill having been done in the East for re-rolling billets. Plates and bars still lead in the current buying. Mills able to make deliveries are holding to 2.50c., Pittsburgh, for steel bars and Eastern makers have advanced bar iron \$5 per ton to 2.75c., Pittsburgh, for common iron. Plates are firm at 2.65c., Pittsburgh, for this year and one Eastern company has quoted 2.75c. for delivery in 1920. Japanese buying is still heavy, their shipyards being sold months ahead. The 50% advance in British railroad freight-rates has put pig-iron up 5s.3d., or \$1.10 per ton. American tin plates at \$7.80, New York, have been sold to Japan and South America on competition with the Welsh product, which is now \$8.60 at works.

COPPER

The situation continues extremely mixed and confusing. Demand is not heavy but the sales that are being made are evidently at widely varying figures, depending on the sellers. It is understood that electrolytic copper for November delivery is sold anywhere from 21.50 to 22.50c., New York, but it is believed that the average of the market is still 21.75c., New York, which we quote as the market price. For Lake copper the quotation seems to be around 22.50c., New York. The longshoremen's strike in New York has considerably interfered with export business, however small or large that might be, and also domestic buying has suffered. It is estimated by some that production now is in excess of consumption, but this condition is not expected to last long.

TIN

The market has been quiet but the situation is dominated by the longshoremen's strike, which is now in its third week. There has been a better inquiry for spot shipment without regard to strike conditions, and this has of course com-

manded a premium. Prices for this, however, have been irregular because sellers' views varied widely so that there was a spread of $\frac{1}{2}$ to $\frac{3}{4}$ c. in prompt tin. Sales have been made in the week, however, from 56 to 56.75c., New York, the latter being the quotation today for spot tin, New York. Tin, ex-steamer at dock, has sold down to 54c., New York, but it is of course not available. Strike conditions are somewhat better and it is said that the steamers 'Homestead' and 'Gaelic Prince' are being worked now, both having heavy tin consignments aboard. The harbor is reported choked with vessels and it is stated that some British ships will return to England without unloading. This is especially true of mail vessels. Very little has been done in far future shipment; the quotation for November shipment from the Straits is 52.50 and 52.75c. asked, the lower prices being due to a slump in London. Tin arrivals to date have been 8100 tons, of which only 150 tons has come in at Pacific ports. The quantity afloat is 2795 tons.

LEAD

The market is very strong and quite active. On October 23 the American Smelting & Refining Co. again advanced its price $\frac{1}{4}$ c. per lb. to 6.75c., New York, and 6.50c., St. Louis. Independent producers followed wherever they could, that is, those that had any metal to sell. Some strikes have been settled and production is better. There seems to be but little lead in second hands, most of it having been cleaned up. There are sellers at close to the Trust price and lead in transit has been offered at 6.80c., New York. A large producer-seller states that he has sold lead this week at 6.85 to 6.90c., New York, and is now asking 6.95c. He also predicts another advance in the price of the leading interest within 10 days.

ZINC

There has been little change in the market and very little business the past week. Prices have remained steady. Prime Western for November delivery is quoted at 7.75c., St. Louis, or 8.10c., New York. The strike situation is the dominating factor and has held back buying both for domestic and export consumption. The general undertone is strong, however, and better times are looked for in the near future. Operator-producers have been the main buyers recently.

ANTIMONY

The market is stronger at 8.75c., New York, duty paid, for wholesale lots for early delivery, due to more active buying for spot delivery.

ALUMINUM

Wholesale lots of No. 1 virgin metal, 98 to 99% pure, are unchanged at 32 to 33c., New York, for early delivery. Remelt metal of the same analysis is 1c. under these levels.

ORES

Tungsten: It is stated that any consideration by the Senate of the tariff bill on tungsten or any other tariff matter will not be scheduled until the Peace Treaty is disposed of. In the meantime the market is dull and stagnant with quotations nominal at a range of \$6.50 to \$12 per unit, depending on the kind of ore, quantity, and delivery. As to ferro-tungsten, quotations seem to be unobtainable. Some say values are around \$1 to \$1.50 per lb. of contained tungsten. The British price is 2s.10 $\frac{1}{2}$ d. per lb. for low carbon, 75 to 80% alloy. It is a fact that importations of the British product are on the way to this country or have already arrived.

Molybdenum: Quotations continue nominal at 75c. per lb. of MoS₂ in 90% concentrate in an inactive market.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

DRUM CONTROLLER FOR SERIES-PARALLEL OPERATION OF LOCOMOTIVE MOTORS

A drum type controller for series-parallel control of two series motors is one of the new products of The Cutler-Hammer Mfg. Co., Milwaukee, Wisconsin. This controller, which is provided with both a main cylinder and a reverse cylinder, is for use on storage-battery locomotives or on trolley locomotives using 250 volts or less.

The motors are accelerated by the main cylinder, which has seven points of control. A star-wheel provides an interrupted motion to the lever, so the operator readily feels the speed points. The fourth point is the full series or low

by fitting the sheet metal cover under a ledge in the top and providing a rubber gasket between the edges of the cover and the cast-iron frame.

This new controller has the following features of construction common to other C-H drum controllers: cast-iron sections of cylinder clamped on square insulated shaft, using no keys or taper pins, thus making removal easy; cylinders readily removed from case by merely taking off top plates; steel contact fingers of main cylinder mounted on square insulated metal shaft, which can be removed by taking out two cap screws; all fingers provided with drop forged copper tips of the non-stubbing type.

The contact fingers and segments may be adjusted or renewed without removing the cylinders from the drum case. Those on the reverse cylinder are exposed by merely loosening two thumb-nuts and throwing back the blow-out plate and arc barriers.

Most mine-duty apparatus is employed where the service conditions are severe and delays in operation costly; consequently this new controller has its parts liberally proportioned to prevent wear and breakage, and those parts which do wear are made accessible and easily renewable.

New C-H Drum Controller

speed running point and the seventh and full parallel or high speed running point. All intermediate points are resistance points. The Wheatstone bridge method is used for transition from motors in series to motors in parallel between the fourth and fifth points of control, and as the circuit is not opened, continuous torque is obtained during the transition. Arc barriers are provided between each contact finger, and strong magnetic blow-outs prevent excessive arcing.

The reverse cylinder is positively interlocked with the main cylinder so it cannot be operated when the latter is in any but the 'off' position. The fingers of the reverse cylinder are therefore not used for making or breaking the current; hence the contact parts will last indefinitely, and magnetic blow-outs are unnecessary.

Two cut-out switches allow either motor to be by-passed, if it becomes damaged in any way, and the locomotive can then be operated by the other motor until repairs are made. When one cut-out switch is thrown to by-pass its corresponding motor, mechanical interlocks prevent closing the other cut-out switch or operating the main cylinder beyond its full series position, thus eliminating the possibility of a short circuit.

A dust-tight and weatherproof construction is obtained

SYSTEMATIZE MOTOR-TRUCK LINES

By E. A. Williams, Jr.*

Systematic organization of motor-truck express lines already in operation, together with intelligent addition of new routes, will afford at least a part solution to the present high cost of living problem, according to men prominent in industry and commerce. Lack of adequate transportation is one of the chief reasons offered for the present crisis. In many cities, Government and State officials are investigating food waste which, according to the commission men, may be traced directly to transportation delays. There are numerous instances of commission firms having been indicted for the wholesale disposal of foodstuffs which, the commission-men claim, were delivered by railroads in unsalable condition. Efficient organization of the motor-truck lines in various communities with the idea of eliminating the possibility of idle trucks and light return loads will go far toward solving this transportation problem and reducing transportation costs, in the opinion of many who have given this phase of the matter careful consideration.

To obtain maximum returns from motor-truck transportation, lines now operating should be systematically organized. Without unity of purpose there is a capacity waste in every community. This naturally results in a loss of tonnage and increased costs. It has been said that 70% of the motor-trucks operating in the United States during 1918 traveled empty one way. From these figures it was estimated there was a capacity waste of 283,500,000 tons during the year. With the establishment of highway transportation commissions in the various States and the organization of transportation bureaus in many of our cities this tonnage waste is being eliminated. In several cities the haulage concerns have formed associations and have estab-

*President of the Garford Motor Truck Co.

lished central offices from which the motor-truck transportation activities of that particular community are directed. These associations are affiliating with associations in nearby cities in order to decrease further the possibility of idle trucks and light return loads and to increase the general efficiency of the service. The motor-truck actually has become a public utility in many localities. Entire communities are depending upon it as a means of supply. It has become equally as essential as the railroad and waterway.

To obtain maximum efficiency, the transportation units of the country—the railway, waterway, and highway—should be linked up systematically. More highways should be built, the present highways improved, and a greater number of motor express lines touching those districts not reached by either rail or water, should be created. That such a system would have important bearing upon reducing the cost of living essentials is apparent. Available Government figures show that in 1919 the cost of shipping by truck throughout the country was from 10 to 30 cents per ton-mile lower than the cost by horse-drawn vehicles. One can at least imagine what this will amount to in a year. Speakers before a recent convention of retail and wholesale grocers in Toledo voiced the opinion that their hope of reducing prices lay in the motor-truck. Practically an entire session of the convention was devoted to this phase of the transportation problem, which they deemed highly responsible for the present high costs. One speaker, an officer of the grocers' organization, declared that the motor-truck held the actual solution to the problem. This recognition of the motor-truck as a transportation factor, coming from men who analyze and understand conditions governing the markets, is noteworthy and should be taken as convincing proof of its worth.

SHALL RESTRICTIONS ON TRANSPORTATION BE PERMITTED TO LIMIT DEVELOPMENT?

By R. E. Fulton*

With the constantly increasing volume of transportation upon our highways, not only the development of the future, but also the needs of today, must be kept in mind. Only one thing can be assumed as certain, and that is that the amount of transportation will continue to increase every year. The problem before us is not primarily good roads nor motor-trucks, but how shall we handle the volume of traffic that is increasing every year at such a rate? In meeting this problem, we must keep in mind first of all that transportation must be cared for; we cannot reduce it or abolish it. We must build our roads up to the demands made upon them by the needs of the people. We cannot permit progress to be strangled by inadequate transportation facilities.

From an economic standpoint, this development of highway transportation lies in the use of larger capacity units. If transportation efficiency is to be the standard, our highways must be constructed or rebuilt to carry satisfactorily heavy motor-trucks of even larger capacity than the largest now in use. If the railroads had been forced to adhere to the 40-lb. rail, instead of advancing steadily to the 70-lb., the 80-lb., and 90-lb. rails, which make possible the powerful locomotives and heavy trains now in use, it is not difficult to picture the economic handicap to railroad transportation, and with it the curtailment of the development of this country that would have resulted. The only difference between highways and railroads is that the highways are publicly owned, whereas the railroads are privately owned.

In the matter of initial cost of motor-trucks, there is a marked gain in economy with the larger capacities. The cost per ton capacity in the case of the average half-ton truck is \$2028, for the 3-ton capacity vehicle, \$1322, and for the 7½-ton, \$740. There is no doubt that the ratio of

increased economy will hold for sizes up to at least ten and twelve-ton capacity trucks. In the operation of trucks we find increased economy on the per ton load capacity basis, not in a few or even a group of items, but in practically every charge coming under the head of operating cost, from fuel to depreciation, and from driver's wages to insurance. Where large units can be used they materially decrease the ton-mile cost of transportation. Comparing the 2-ton capacity truck with the 5-ton capacity, we find that in increasing the load carried 150%, the operating cost is decreased 18.2%; while comparing the 3-ton with the 7½-ton, there is also a 150% increase in carrying capacity with a decrease of 22.8% in operating costs. Unquestionably, this ratio will hold good for much larger sizes, so maximum transportation efficiency in motor transportation must be sought in vehicles with carrying capacity greatly beyond the largest in use to-day. In view of these facts, our highways should be built to stand the amount of traffic that is demanded of them. Limiting the gross weight of any vehicle to less than 28,000 lb. is short-sighted economy for the present that is storing up a large amount of trouble and expense for the future. Roads must be built to meet the requirements, for the requirements cannot be limited to road conditions.

COMMERCIAL PARAGRAPHS

C. W. Cross has been appointed by the Chicago Pneumatic Tool Co. as manager of western railroad sales, with headquarters at Fisher Bldg., Chicago.

The A. H. Simpson Co., San Francisco, has purchased the mill of the California Quicksilver mine situated about 42 miles from Winters, California. This 100-ton mill had been in operation only about 60 days. The equipment consists of a ball-mill, gas-engines, compressor, concentrators, drill steel, rails, etc. Orders are solicited for any part of this material. Shipment can be made promptly.

The industrial growth of Texas and Oklahoma, the increasing importance of their oil industries, and the large demand made for modern machinery in this and other lines, has led the Ingersoll-Rand Co. to establish a branch office to serve this territory. The new office, in the Sam Houston Life Bldg., Dallas, Texas, will be in charge of R. H. Brown, Jr., as manager. Mr. Brown has heretofore been connected with the company's St. Louis office and has, for years, been in intimate touch with the Texas-Oklahoma territory.

The complete 500-ton concentrator and 250-ton copper smelter of the Penn-Wyoming Co. at Encampment, Wyoming, is being dismantled by the Morse Bros. Machinery & Supply Co. of Denver. The 16½-mile Leschen tramway is also being prepared for shipment. This tramway was built in four sections of four miles each, and is available for immediate use. Over 96 miles of wire rope, 925 buckets, 196 towers, and tension stations, with complete terminal irons make up the tramway equipment. This was said to be the longest successful tramway in the world.

The dust nuisance is a problem that confronts most manufacturers that have to grind or handle fine, dusty material. On account of the many difficulties caused by a dust-laden atmosphere, most modern plants are making efforts to solve the problem. The solution in general takes the form of some device for filtering the air and collecting the dust in the filter. To meet the increasing demand for apparatus of this sort, the Allis-Chalmers company has developed and is now placing on the market a patented bag-filter type of dust-collector. This is the first machine of this type to be designed, built, and put into successful operation by an American manufacturer. It is completely described in Bulletin No. 1454.

Wilfley Tables are Used at Calumet and Hecla

Ever since the first Wilfley table was put in operation over twenty years ago, table concentration has had a recognized place in ore dressing. It is now applied before the flotation process or after it and often for the treatment of the concentrates.

The fact that it pays the large milling companies to use table concentration, wherever possible, should cause every mill owner and operator to consider the question.

Wilfley tables with Wilfley Riffing, Head Motion, and Construction, satisfies the demand for high extraction and continuous operation with minimum attention.

What others are doing with Wilfley tables can be duplicated or bettered by Wilfleys on your ore. Our Engineers will help you.

GOLD from the South African mines is being sold at a premium of 15%. This was stated by Sir Evelyn Wallers at a recent meeting of the Transvaal Chamber of Mines. He added, however, that there was no knowing how long such a premium would be obtainable.

EIGHTY periodicals are said to have moved from New York on account of the strike of the printers' men and the walk-out of the compositors in that city. They have moved to different cities. The 'Engineering and Mining Journal' has produced its issue of October 4, from plates, in San Francisco, and we are glad to see it. We hope that its troubles, entirely unmerited, will soon be over.

LIFE and work in the Orient is the subject of an interesting article in this issue by Mr. Gilmour E. Brown, who will be recalled as the author of an informing account of 'Mining Development in China', appearing in our issue of May 17 last. Mr. Brown has had a wide and varied experience in China, the Malay States, and the Dutch East Indies; he gives the younger men in the profession many useful hints concerning the conditions under which mining engineering, more particularly the examination of prospects, has to be done in that part of the world.

IN the 'Personal' column will be found mention of Mr. Frank M. Smith's appointment as representative of the Bunker Hill & Sullivan Mining & Concentrating Company at Spokane. Mr. Smith has been in charge of the East Helena smelter, of the American Smelting & Refining Company, for 17 years. Mr. Jules Labarthe is director of the Bunker Hill smelter, Mr. Stanly A. Easton is resident manager for the company, and Mr. F. W. Bradley, of San Francisco, is president. We understand that the company intends to expand its smelting business by bidding for a larger tonnage of custom ores, and has engaged Mr. Smith, a Western man of wide experience and proved sagacity, for this purpose. The smelter was designed by Mr. Labarthe, of the firm of Bradley, Bruff & Labarthe, and is one of the best equipped plants in the United States.

CONGRESS is said to be considering the planning of a national budget. It might begin by stopping some of the waste exhibited by the 'Congressional Record'. A recent issue, that of October 8, consisted of 64 pages, including the reprints of sundry articles from daily papers, a sermon attacking the President, and an article by Mr.

Frank Simonds on the failure of the Peace Conference, besides the report of a debate between a member of the Federal Trade Commission and a representative of the Chicago packers. We may add that we find it unnecessary to buy any scribbling paper for our own use. It is supplied by various departments of the Government, their circulars fortunately being printed on one side only, and we confess that in many cases the blank side interests us more. The extravagance at Washington sets a bad example to the people of the United States.

AS many of our readers are aware, the California Metal Producers Association and the State Chapter of the American Mining Congress have co-operated since January last, when the second organization was started. On October 22 the two organizations were merged by the absorption of the Metal Producers Association into a local section of the Mining Congress, to be known as the California Metal and Mineral Producers Association. Mr. George W. Starr has been elected president, with Mr. E. C. Hutchinson as first vice-president. Mr. Robert I. Kerr, the efficient secretary of the former Metal Producers Association, will serve as secretary-treasurer of the consolidated organization, which will include those interested in oil exploitation as well as in metal mining. We bespeak the support of the mining men of the State for this organization, which is in excellent hands and is thoroughly capable of representing them in matters of legislation or any other question affecting the industry.

MINING in the North-West is sure to receive a stimulus from the purchase of the Premier, or Bush, mine in British Columbia by the American Smelting & Refining Company. The price, for a 51% control, has been stated variously as one million and five million dollars; we understand now that it was \$4,000,000. The Salmon River district, in which this rich silver mine is situated, is at the head of the Portland Canal inlet, which is one of the many natural cross-cuts made by the sea, in the wake of erosion, through the Coast range. This region has been made noteworthy by the Hidden Creek mine of the Granby Consolidated company, which has established a large milling and smelting plant at Anyox, on Observatory inlet, and also by the Dolly Varden, another important mine a little farther inland. The three mines mentioned are all a short distance inside the boundary of British Columbia; they just fail to be in Alaskan territory. The account given, in our issue of last week, by Mr. Charles Bunting of the manner in which Mr. R. K.

Neill, of Spokane, discovered the orebody in the Premier mine, is well worthy of careful reading. Mr. W. J. Rolfe did the first exploratory work five years ago and found enough rich ore to attract the attention of capitalists. These were represented by a well-known mining engineer, Mr. H. R. Plate, who started exploratory work in the winter of 1915 and continued the search for ore until early in 1918. Mr. Plate failed to find any large orebody, but Mr. Neill was not discouraged by this failure; on the contrary, he thought well enough of the prospect to bond it for \$100,000 and to begin work on his own account. Then ensued the tragedy of mining, from the point of view of his predecessor, namely, the demonstration of the fact that the No. 1 tunnel had been run parallel with a rich vein for a length of 250 feet, missing the ore entirely. Cuts of only six feet sufficed to disclose a bonanza of more than ordinary dimensions. From Mr. Bunting's description it would appear that the tunnel was driven diagonally across the ore-shoot where it was poor and then became diverted by a slip that took it away from the vein, continuing at a small distance from it until the vein was cut in the breast just before work ceased; but unfortunately at this point the vein was almost barren and so poorly defined that Mr. Plate failed to realize that he was on the right trail at the moment of abandonment. As Mr. Bunting says, "this is an outstanding example of a great mine being missed by a very small margin". It is by no means the first example of such a mishap. We venture to say that such misses are due to the failure to follow the traces of ore and the hankering to drive ahead in easy ground. A lode is something that 'leads' a miner; he must take care not to be misled by other structural conditions, keeping his eye on any traces of ore that may persist after his lode has become pinched or poor. There is no worse method of exploration than that of running workings in straight lines or on a plan of operations devised at the surface for convenience in tramming. The first step in mining is to find ore and the second is to follow it, disregarding the allurements to extend a drift or a cross-cut to one side. To prevent a false step, it is necessary to give close attention to the evidence accruing from day to day. Here is where the man accustomed to prospecting, to 'nursing a prospect', as we say sometimes, shows his ability, as Mr. Neill did. His is the reward that comes to a true miner.

IN our issue of October 11, referring to mining in Korea, we wrote of "the late" Hansaburo Hunter. We learn now that this statement is "greatly exaggerated", for Mr. Hunter is very much alive. We confused him with his father. Apropos of Korean mining, we have received the latest annual report of the Seoul Mining Company, which is operating on the Suan Concession and is the scene of the operations being described in the series of articles by Messrs. Weigall and Mitchell-Roberts. In the year 1918 the Seoul company produced \$734,405 in gold, \$31,960 in silver, \$580,066 in copper, \$10,708 in bismuth, and \$664 in tungsten, besides making \$46,882 by interest and exchange, this last being charac-

teristic of operations in the Orient. The gross profit was \$267,527, of which \$94,514 was set aside for depreciation, as against a net profit of \$330,526 in 1917. The total production of metals was worth \$1,343,234, from 201,151 tons of ore, averaging \$9.64 per ton. The operating cost was \$4 per ton.

Mining Speculation—I

We note that the 'Financial Times', the leading daily financial paper of London, has been publishing a series of articles on 'Mines and the Speculative Investor', written by its mining editor, Mr. J. A. L. Gallard, who has recently returned to his desk from military service in France. These articles are interesting because they have been prepared by a journalist keenly in sympathy with the best traditions of the mining business in a city that was the centre of mining in its worldwide aspect, and they are also interesting because it is not often that a financial paper discusses the technical phases of mining in a manner at all convincing to those well versed in it. The first article begins by noting the fact that during recent years a large number of new speculators have come into the mining market on account of the heavy taxation of incomes, the incidence of this taxation having driven them to purchase shares for capital appreciation, which, it appears, is not taxable in England, rather than for dividends, which are at the mercy of the tax-collector at their source. Among those who are participating in mining-share speculation are many unversed in the technique of mining operations or even in the terms used in the reports sent by the managers of the mines themselves. Hence Mr. Gallard's articles, which are meant to help the novice. He avoids the nice question whether mining is an 'investment' or a 'speculation' by calling it a 'speculative investment'; at least he writes his articles for the "speculative investor", which is not a bad name for those who, when they buy mining shares, are uncertain whether to treat them as a speculation or an investment, leaving it for the logic of events to decide whether to sell soon, after a big rise or a heavy drop, thereby making it a speculation, or to hold their shares a long time, for the sake of the dividends, thereby making them an investment. Of course, if the purchase is made in the hope of a rapid appreciation of the capital, or principal, it becomes a speculation. Mr. Gallard says that he has heard mining engineers deplore the fact that the mining industry should be so closely associated with speculative activity. The wish has been expressed that the mining industry should be "entirely dissociated from the Stock Exchange". He replies to such idealisms promptly and confidently by asking how could the money for the exploitation of mineral deposits be obtained except by affording facilities for dealing in shares? To this we would add that if the finding of capital for mining were confined to those able to hold mines and work them to the point of exhaustion, the number of mines active at any time would be small. By sub-dividing the ownership by means of shares it becomes possible for many to

take a hand and at the same time it enables the originators or promoters of mining ventures to transfer their holdings piecemeal on an open market. In other words, the many, called the 'public', are able to join the few, called the 'insiders', in working mines. Sometimes the insiders find it more profitable to work the public, rather than the mines, but that is another story. Mr. Gallard recognizes the speculative character of mining shares, the uncertainty as to their real value being due to the variable character of ore deposits, the fluctuation in the market-value of the metals they yield, the varying skill of the management, and the vagaries of the share market itself. He considers that this very uncertainty, so characteristic of metal mining, is responsible for the increase of public participation in the speculation incidental thereto, because "the uncertainty affords scope for the imagination and opens up possibilities of handsome profit". That is true. The increase of taxation and the lessening value of money have made the gilt-edged investments, with their 4 or 5% return, unattractive as compared with the 'flutter' in stocks that afford a chance of doubling one's capital within six months or of drawing a 25% dividend for a few years, at least. There is this to be said, that the average man finds it difficult to invest safely; out of five 'dead-sure' investments, one is likely to go wrong; the miscarriage of one out of five of his supposedly safe investments involves a loss nearly equal to the interest obtained on the other four; so he decides that it will be good business to take large risks, with the chance of large gains, on one commitment, at least. He thinks to average by four investments and one speculation. Some such policy or plan of operation is common with the majority of men having money that they wish to put out for an unearned increment. As a detached, but sympathetic, onlooker, we would say that the average man unversed in mining, but desiring to speculate in mining shares, is foolish to risk money that he needs in his business or for his home; if he speculates—and mining to such a man is necessarily a speculation—he should use only money that he can afford to lose, that is, a sum so small relatively that the loss of it will not cripple him financially. Another suggestion we venture to make is that a high rate of interest usually indicates risk. A gilt-edged bond or preferred stock will not pay 7%; if it is safe and pays 7%, it will be quoted at a price yielding 5%. The average man, namely, one not having access to expert financial advice, his own or another's, should distinguish between an investment, which yields a low return and is safe, and a speculation, which yields a large return and is risky. He should make up his mind whether he can take a risk or not. If he cannot afford to run a risk, he should content himself with a low rate of interest, postponing a hazardous venture until he has some money on the side that he can afford to lose. The tragedies of mining are those of poor people venturing their all on a risky undertaking, not the losing of large sums of money by rich people. Mining is not adapted to the productive use of money belonging to widows and orphans; it is a man's game.

State Insurance: An Experiment

Among the institutions devised by civilized man for the purpose of alleviating the consequences of such disasters as are due to natural causes there is none giving better proof of his sagacity than insurance. It means the making of oneself safe against something, more particularly the risks of life. By means of it we carry one another's burdens and break the severity of the blows that fate may have in store for us. The first appearance of insurance is recorded in the marine loans of the ancient Greeks as described by Demosthenes. In medieval times this practice had become well developed in maritime affairs, the mariner making a bet, as it were, that he would not return safely with his cargo, whereas the marine gamblers bet that he would escape the hazards of storm and piracy. If he returned, he paid the short end of the bet; if he failed to reach port, his heirs received the long end of the bet. At Lloyds to this day it is possible to hedge against bad luck by making bets on every conceivable subject, from the weather that may spoil an outdoor performance to the death of the Prime Minister. The odds are given upon an expectancy founded upon the experience of the past, hence they have a logical basis. So has life insurance, which is a highly scientific business built upon actuarial statistics. The same is true of accident insurance and, to a less degree, of fire insurance; both have been elaborated on a scientific rationale. Such a business, of course, lends itself to trickery, for the insured may not tell the truth and the insurer may evade his contract. Therefore governments have taken cognizance of it, by passing laws regulating the business; but this has rarely sufficed to protect the public against the predatory phase of insurance, so that forms of mutual insurance have been devised. Likewise employers have ensured their employees and then ensured themselves in turn against the obligation created thereby. In several progressive countries, such as England and New Zealand, the employer has been compelled by law to carry insurance for the protection of his employees, with a choice either of providing means for insurance himself or of contracting with an insurance company to do it for him. The smaller employer could not carry the insurance of his employees without incurring a dangerous risk and the insurance companies demanded excessive rates, so, in New Zealand, for example, a fund was provided by the State for the purpose, and while this did only 10% of the business, it served to regulate rates. New Zealand claims that England copied her methods; indeed, it appears that the land of the Maoris was the first State to underwrite, beginning with life insurance and then extending it to compensation. The Californian law follows the British system, not the German, being founded on the common law of the English-speaking peoples. It was the experience of New Zealand that prompted the members of the Industrial Accident Board, in 1912, to introduce the legislation necessary for this purpose. The Workmen's Compensation, Insurance, and Safety Act was passed in 1913 and went into effect on

January 1, 1914. The Act was designed to provide compensation for wage-earners when hurt in the course of their work, to devise ways and means for preventing accidents, and to afford employees an opportunity, at their option, of taking out insurance against the compensation risk under State auspices. This legislation was not accomplished without vigorous fighting, for, as might be expected, the insurance companies claimed that the business belonged to private enterprise, whereas Mr. A. J. Pillsbury and his friends of the Accident Board insisted that insurance was a public service and that the welfare of the community required the institution of compensation insurance, at least. It was contended that politics must get into the management of the State Compensation Insurance fund, the control of which was given by the State to the Industrial Accident Commission. Attempts were made, by insurance carriers, to make this forecast come true, but the two Governors in office since the Fund was created have shown unusual forbearance from the exercise of political interference, and the manager selected to administer the Fund, Mr. C. W. Fellows, has proved himself a man of exceptional ability and integrity. It was predicted that the State would get the bad risks, and the companies the good ones. This was not an unreasonable expectation, but it has been falsified by events. Pains have been taken to aid the bad risks to become good risks before they were given insurance; and this has been done with gratifying success. The ratio of loss to the Fund is lower than that of other insurance carriers; the selection of risks by the State has been done with as good a judgment as that of the insurance companies and with much better discernment than that of a number of companies whose underwriting has driven them off the field of competition. It was asserted that private enterprise can do business cheaper than the State. It can, but it does not. The overhead expense of the companies last year was 40%, whereas the Fund did business for slightly under 12% of its receipts. Thus the State is transacting its insurance business at less than one-third the cost set aside by the companies for that purpose, and yet the State bears not one dollar of the expense of the Fund. The only advantage that the State fund enjoys is that the State pays the salaries of the Industrial Accident Commissioners, who sit as a board for directing the general policy of the Fund, giving, however, not more than two hours per week to this work. The Fund pays the same taxes, except the Federal, as other insurance carriers; it pays for all its labor, rent, and every other item of cost incurred in doing an insurance business, but it does not wine or dine legislators and it does not bribe employers to give it their business. The State fund is now doing 40% of the ensuring for compensation, as against 60% that goes to stock companies. These attribute their success to salesmanship. The real incubus on the business is the insurance broker, who is only one of the many unnecessary and misplaced middlemen contributing to the excessive cost of living and dying. The insurance broker is paid by the wrong party; in consequence, the insurance company has to fight as tenaciously to hold its old business as to get new business. The State fund es-

capes this burden and in the end will get all the business unless crippled by adverse legislation. The Fund started with a capital of \$100,000 and the Legislature appropriated \$68,470 for the use of the Commission in supporting the Fund for two years in the event of its business not proving self-supporting. None of this appropriation has been so used. The record of the last five years is given herewith, showing the premiums received annually and the cost of doing business.

| Year | Premium | Cost, % |
|------------|-----------|---------|
| 1914 | \$547,161 | 12.65 |
| 1915 | 655,676 | 15.48 |
| 1916 | 928,286 | 14.05 |
| 1917 | 1,373,791 | 14.76 |
| 1918 | 2,459,086 | 11.79 |

It will be noted that the average cost in the five years was 13.75%. The original capital of \$100,000 has not been touched. For two years now the Fund has paid 4% interest on this sum into the Accident Prevention Fund. The business of the State Compensation Insurance Fund for the five years has resulted in a surplus, exclusive of the \$100,000 capital, amounting to \$1,038,959. The average profit per annum has been \$207,792, and the ratio of profit to capital, which always remained invested at 4½%, has been 207% per annum. Up to last June, a sum of \$1,039,533.57 has been received in dividends by the policy-holders, to whom the Fund has paid a dividend averaging 15% regularly at the end of each year and a second dividend averaging about 20% after 3½ years. In this way those who ensure with the Fund get their business at exactly what it costs, no more and no less. A sum of not more than \$1,000,000 is needed to protect the Fund against a possible catastrophic hazard and make it strong enough to ensure the largest risks. If no dividends had been paid the policy-holders, the average profit for the five years would have been 338% per annum. This throws an interesting light on the insurance business. Unquestionably the State Compensation Insurance Fund of California has been a great success. This has been due to exceptionally good management, to the enlightened enthusiasm and absolute integrity of the Industrial Accident Commission, and to the consequent exclusion of the graft and chicanery that usually blight the administration of State control over industrial activities. It is worthy of note that many of the largest mining companies in California have availed themselves of the opportunity to take compensation insurance in the State fund. This adventure in State insurance should awaken the interest of every citizen in this and other States, for it represents an experiment that gives promise of bigger things. It suggests other forms of insurance for the relief of human hardships, such as sickness, unemployment, injury, and old age. The systematic mitigation of these common hazards promotes the happiness and self-respect of the members of the community, and the stability of the social organization; and thereby serves to check anti-social vagaries and present a resolute front to the sentimental anarchy of bolshevism.

DISCUSSION

Smelting Zinky Lead Ores

The Editor:

Sir—In your issue of July 12, Herbert Lang, in his interesting 'Metallurgical Journey to Shasta', referring to the ores of the Afterthought mine and to the trial there of smelting in reverberatories using wood as fuel, says: "It should have succeeded . . . the reverberatory furnace is superior to the blast-furnace in treating zinky ores." and further, "although the abundant zinc in the Afterthought ore would have proved a serious obstacle, this method, even now, is far preferable, under the circumstances, to the blast-furnace process that succeeded it". Further on, again, he suggests that the abundant supply of wood should be utilized in reverberatory smelting, although "direct firing with wood may not answer on so large a furnace".

If Mr. Lang were acquainted with Australian practice he would have written more strongly, and his doubts, as to the effect of high zinc and the possibility of heating large reverberatories with wood, would be set at rest. Wood-fired reverberatories have been in use throughout Australia since the early days of smelting, 60 or 70 years ago, and, wherever conditions are favorable, are still in use. It is possible to heat furnaces, up to at least 50 ft. in length, with wood only by hand-firing. At this place we have had a furnace working many years which is 40 ft. long between bridge and vulcatory, and, I am told, the Lloyd's copper mine, at Burruga, in New South Wales, has one that measures 50 ft. between the same limits. Both use nothing but wood, with no special means to aid the combustion of the fuel.

At this mine we found that it was an advantage to provide the fire-box with two doors, and the air-holes over the bridge drew their supply from the culvert beneath the hearth, which consists of four arches instead of the old-fashioned single arch. We provided a side tap-hole for slag, as well as the usual end-skimming door; we have no difficulty in keeping the charge liquid; the greater part of the slag is run off, without skimming, from both places. It is found, with these big furnaces, that it is an advantage to run a first lot of slag from the side door, about half an hour before the charge is finally 'ready' for the front-door discharge. I shall be pleased to give plans and photographs of our 40-ft. furnace to Mr. Lang, if requested.

Mr. Lang is undoubtedly right when he says reverberatories surpass blast-furnaces in treating zinky ore, but I believe he is wrong in thinking "abundant zinc in the Afterthought ore would have proved a serious ob-

stacle". He quotes that ore as carrying 2.8% copper and 15% zinc. The Silverspur ore averages 1.25% copper and 26% zinc, and thousands of tons have been smelted carrying 30% zinc. Our slag-dump averages 25% ZnO, and under 30% SiO₂. The idea that high-zinc slags are thick and will not run is quite erroneous; a high-zinc slag is very liquid and would run for miles, if required and the supply were kept up.

The whole secret in smelting copper ore high in zinc, to matte, in reverberatories, lies in keeping down the sulphur. Probably the sulphur limit varies with different ores; in our case, so long as the sulphur in the ore does not exceed 10%, we have no trouble; 8% is better; but the moment the sulphur rises above 10% trouble begins. With 1.5% copper and 8% sulphur in the ore, no zinc-matte is formed, and the matte, which averages 35% copper, contains seldom more than 2% zinc. The only flux we use is limestone, which forms about 15% of the charge, and occasionally ironstone and quartz. Ironstone we try to avoid, as it increases the silver in the slag. I think there is no doubt a higher temperature is needed to smelt zinky ores than is required for ores free from zinc; but the heat can be obtained from wood fuel with ease.

To my mind the Afterthought ore, with 2.8% copper and only 15% zinc, should easily smelt in wood-fired reverberatories, and make a 65 to 70% copper matte in one operation.

While on this subject I should like to say that, in my opinion, the generally accepted explanation of the reason why zinky ores give so much trouble in the lead blast-furnace, is wrong. During the last few years I have seen that reason given by different writers in your paper, namely, that the zinc makes a heavy thick slag, which will not run, and forms sows and accretions that will not melt. Thirty odd years ago, when I began lead smelting, I was taught that also, and accepted it as correct, and my experience showed that those things certainly happened, and that only with difficulty, and very slowly, could a furnace be run with even 15% of ZnO in the slag. Later on, when I saw the fluidity of high-zinc slags in the reverberatory furnace and the bad effect of sulphur, I began to puzzle the thing out in my own mind, and finally formed the notion that it was the sulphur that somehow caused the difficulty in the lead blast-furnace, and that, if all the sulphur could be eliminated beforehand, the blast-furnace would make as easy-flowing and as fluid slags as the reverberatory. So I erected a plant and tried it, and found that I was both right and wrong. With scarcely any sulphur in the charge (almost no

matte was made, and what was made ran very high in copper), the furnace started like a racehorse, and the slag ran like water (it carried over 17% ZnO) for a shift; then quite suddenly, a change took place and the usual symptoms appeared, the disease galloped along at a great rate, and at the end of 24 hours the furnace was moribund. The charge had to be cut out, but, to our surprise, we found neither sows nor accretions. So we tried again, and again, and always with the same result: at the end of a certain period the same symptoms appeared and the fire went out!—for that is really what happened.

We invented all sorts of explanations, but soon noticed that increased fuel, and increased lime flux accentuated the trouble, and then I noticed, when cleaning for a fresh start, that the coke in the middle of the furnace appeared as if it had been dipped into a bucket of whitewash. It was, in fact, covered with zinc oxide, and so choked as to prevent effectual contact of the oxygen of the blast with the carbon of the fuel. Eureka! So, at once, I made no more attempts, having spent \$40,000 of my own and my partners' money (chiefly my own, let me say), in finding out "what any fool with a knowledge of chemistry would have known before".

After the fiasco I hunted through my books again, and at last found, on page 20 of M. W. Iles's 'Lead Smelting', the following: "The decomposition of sulphide of zinc by iron produces metallic zinc, which burns with a blue-white flame in the upper part of the furnace to an oxide, and coats the furnace-walls, as well as the ore, and a part of the fuel, causing it to burn irregularly, if at all." So it was all known before, and I had read it several times, but had not the sense to apply it.

In smelting zinky ore in the lead blast-furnace all goes well while clean coke can reach the smelting-zone, but, soon the zinc liberated by the fuel and flux rises and oxidizes and deposits itself on the coke coming down with succeeding charges, and when the fuel reaches the smelting-zone its pores are more (with high zinc) or less (with low zinc) clogged by zinc oxide, and it burns more slowly; in consequence, the temperature falls, the slag becomes pasty and will not run freely; the usual symptoms appear and increase, until the furnace has to stop, or is run down, barred and started again, filled up with a lot of charges mixed with clean coke, and the cycle is repeated.

If the zinc in the charge is in the form of silicate and the ore already contains enough combined lime to form the slag, the furnace will run many days before clogging, although the percentage of zinc may be very high—I don't know how high. Probably the success of the Huntington-Heberlein process on high zinc-lead ore is due to the fritting, which converts the added lime into silicate, and renders it no longer available to reduce the zinc to the metallic state in the subsequent smelting. No doubt this accounts for the success, too, of Bartlett's furnaces at Canon City years ago; he fed his fuel through a slot on the level of the smelting-zone, or just above it, and so had always clean fuel. I have been told that the

Japanese have furnaces which feed the fuel at the tuyere-level, and if so, they ought to be able to run high zinky ore through blast-furnaces, if they keep the sulphur low; probably they do.

I see no reason why powdered coal blown through the tuyeres should not succeed in smelting zinky lead ore in the blast-furnace, other conditions being suitable.

EDGAR HALL.

Silverspur, Queensland, September 15.

Concerning Strikes

The Editor:

Sir—In the voluminous current literature telling us about our present troubles, and those on the way, it is a relief to pick up a stray fundamental idea that looks as if it could be a stepping-stone to better conditions. We know that we are in trouble all right, but what we all want more to know is something of a concrete, curative nature to do about it. Preaching economic sanity is one thing we can all do; and trying to hammer into people a sense of personal, individual responsibility for whatever governmental and social conditions exist is another—this to begin back of the elections to public office, back even of the primaries—in the selection of real representatives instead of job-hunters so that ours may become a representative government in fact and not in name only. But after getting real representatives we must have a program, and we should be formulating distinctly in our minds the things that we want carried out. What specific thing, for instance, do we really think should be done to improve the relations of labor and capital and bring about that mutual confidence, the lack of which is the cause of so much of the present trouble in the world?

It seems to me that the editorial 'Concerning Strikes' in your issue of October 12 contains an idea that should go into such a program and become one of the planks of a platform upon which we should ask our representatives to stand. Referring to the frequent breaches of contracts and agreements on the part of labor unions you say: "The only cure for that is to pass legislation compelling labor unions to incorporate, so as to render them responsible for breach of contract, and then to hold the companies and the unions impartially to the observance of their obligations." The proposition is so manifestly fair and reasonable that it should be only necessary to state it to secure acquiescence. It has been stated before, and the wonder is that it has found so small a place in discussions. Over 17 years ago I addressed a circular to striking employees which contained the following: "If a majority of the men working for this company should see fit to form an organization, duly incorporated under the laws of the Territory so as to make themselves amenable to the same laws that apply to this company, in other words become as a body financially responsible for their acts so that they could be dealt with on a business basis, such an organization could rightfully present its claim to recognition and expect to be dealt with on the same

terms as any other incorporated body. It is unreasonable, however, to expect the recognition of an organization which does not even declare the identity of its members in advance of its demands and whose members have so little faith in their ability to defend the legality of their acts as to fail to place themselves in a position to be compelled to do so in the same manner as this company is compelled."

It seems to me that in again raising this question of incorporation a distinct service has been rendered and a tangible, definite thing proposed that can be the object of endeavor. One-sided contracts never work. The restraints of definite enforceable agreements are needed for both sides. Without them the appalling waste of the accumulated capital of the world, which accumulation has brought the average well-being of men up to a point never reached before, will go on to exhaustion, with inevitable retrogression to the suffering of a fierce struggle for existence through which we have come up, perhaps many times, like the working over of the rocks in geologic ages. The question seems to be, is man's intelligence yet sufficiently developed to make him see that his position can be held and advanced by orderly methods well within his grasp, or must he again go through the weary cycle of disintegration and re-building? The engineer, being one who "organizes men and directs the forces of nature to the uses of man", must do his part at this possible parting of the ways.

Mill-Tests v. Hand-Sampling

The Editor:

Sir—I appear to be unfortunate, either in failing to express my meaning clearly or in not receiving careful reading of my words. Your editorial on my letter published in your issue of August 2 indicates one of the above two things. This question of arriving at sampling-errors is obviously of prime importance in estimating the value of ore deposits. I feel therefore that I am justified in using further space in making my points clear.

The editorial infers that I consider the limits of 8% to 10% to be the safe ones within which the method under discussion can be safely applied. This again infers that outside these limits I do not think the method would be safe to apply. I mean nothing approaching this, and in re-reading my letter I cannot see how it can be read in that way. Such a contention would to my mind be absurd. If the method can apply only to such a narrow limit of difference as 8% to 10% it would certainly not be applicable to the majority of deposits. It is indeed more especially on deposits where the discrepancies between bulk and hand samplings would be large or variable that the method would be most needed as a corrective on hand-sampling.

Let us briefly review the points: Mr. Morton Webber set out a method of utilizing bulk samples to secure sampling-errors to apply to hand sampling. His diagram indicated that his idea was to divide a deposit into a

number of areas, each one of moderate dimensions. Each one of these areas was given a sampling-error on the strength of one bulk-sample. These sampling-errors varied from 8 to 25%. There are other points, but as there is no disagreement or misunderstanding on them, we can omit them here.

I submitted (and submit) as follows:

1. That 25% is an enormous discrepancy and that I should myself not be prepared to accept it, on the strength of one bulk-sampling, as a discrepancy to apply to a considerable body of ore, that is, without verifying the result by other comparisons.

2. That the idea of subdividing into areas did not appeal to me in itself.

3. That areas could advantageously be utilized if they represented different natures of ore, but otherwise I could not see the principle.

4. That a more logical method would be to choose a few places representing the whole of the ore of one nature in a deposit—or representing the whole deposit, if its ore were of one nature.

5. That supposing three bulk-samples were taken at three such chosen places, then, if these three agreed closely as to the discrepancy between bulk and hand sampling (I suggested 8 to 10%, this being a common degree of sample-error), the average of the three might be accepted for the whole of the said ore, without further tests. That, if these tests gave more variable discrepancies (I supposed 5 to 15%), it would not be satisfactory to stop at that number for purposes of obtaining an average, but to make further comparisons, until the facts brought to light were considered sufficient to warrant a sampling-error being calculated and used. This is totally different from the inference in the editorial.

I said that Mr. Webber's method of areas might be claimed to give the same effect as averaging the discrepancies, that it resulted in averaging them, but in a different way. To this I pointed out that if the principle was that the sampling-errors might be inaccurate for the individual areas but that the number of them would introduce the law of averages, then, with areas of approximately uniform width, the effect of the two methods would be much the same; that, however, if the deposit varied greatly in width, then the method of separate areas might give results very appreciably differing from the true average. It would be superfluous to elaborate this fact.

Regarding the preceding paragraph, I am not clear as to whether Mr. Webber's method infers that each bulk-sample is taken as representing the area by itself or whether he relies on the law of averages to yield an accurate result for the deposit as a whole. It appears to me that to have a considerable number of areas, and to do the bulk-sampling so that the sampling-error for each can stand by itself, would entail a great deal of work and that this work could be lessened on the lines I have outlined. I have inferred that this is not his intention, but that the number of the areas would check inaccuracies in the individual areas.

I say above that 8 to 10% can be taken as a common degree of sampling-error. This remark applies only to actual error in sampling and does not include lowering of grade by admixture of wall-rock. My own experience has been that about 12% is the commonest degree of error as compared with actual contents of the ore mined. The degree, however, varies considerably.

Having arrived at the sampling-error or errors to be used, the additional allowance for inclusion of wall-rock must, of course, be a matter for personal judgment, based on experience, on the method of excavating, and the nature of the country-rock.

A Steel Industry on this Coast

The Editor:

Sir—Through the columns of your publication I would like to make a few remarks on the steel manufacturing industry on this Coast.

I have lived on the Coast now since 1909, and have been associated with people who had the ambition to inject the incentive into industry, to get a steel industry organized and on a paying basis. In some directions this has been an accomplished result, as may be seen by the representative steel plants in Portland, San Francisco, Los Angeles, and Seattle. There are certain products, now purchased from Eastern mills, that could be produced on this Coast. There are several known reasons why they are not produced here, to be sure.

In parallel with the present going concerns, there exists an element of some magnitude, always attempting the experiment in producing steel. Why is it necessary to experiment, in producing steels, when we have such tried and proved methods of doing it, and when all that is needed is a greater perfection of the present existing methods? The general trend is to try and produce steel direct from the ore in one stage process. I won't say "It can't be done", but I will ask, "Can it be done economically, and profitably, and can the product be guaranteed uniform in chemistry and properties, and does the direct reduction process have any advantage over the scrap melting method?" If these questions *can* all be answered in the affirmative, even then, why not start the plant on well known and tried processes, to assure the investors the proposition is a business one; and then perfect later the newer process, if it has the virtues claimed?

Would it not be more profitable, on this Coast, to produce the raw pig first, and to develop a supply of raw material? This is really what is needed, before a healthy steel industry can be developed. Why not use our available iron-ore resources for the production of pig metal, which is really needed here? The direct-to-steel process surely must cost more than the reduction to pig. So it cannot be said that the cost interferes. Steel scrap is yearly getting scarcer on this Coast. What does it mean? It means a greater tonnage of virgin metal is needed to

support the steel industry, if it is going to make products here instead of purchasing cheaper from Eastern mills. The reason they are cheaper in the East is because of the tonnage produced and the absolute availability of the raw materials. Could not some of the efforts be extended to these requirements, instead of trying something new, uncertain, and unprofitable?

R. C. GOSROW.

Seattle, October 24.

Dutch Guiana

The Editor:

Sir—With at least part of your editorial on Dutch Guiana, appearing in your issue of August 9, I must take exception. When you say "Dutch Guiana is good neither for the health nor the purse of the American miner", I assume that you do not know the health situation here as it really is. Hollanders, Englishmen, and Americans have lived in this country for years without showing any ill effects of the climate, and, while near the equator, the heat is never felt here as in New York, Chicago, or St. Louis during the summer time. A sunstroke is not known. During the Spanish influenza epidemic, not one white foreigner died in the Colony.

One American mining company employs, on an average, nine American engineers; they are 160 miles from Paramaribo in the bush, engaged in surveying and preliminary work that keeps them out all the time, in all kinds of weather, yet they are and have been well. I think that a comparison of the health conditions of this Colony with any of the American camps in their early stages would show that an American miner can live and work here as well as in most places.

As to the purse of the American miner, this is quite another thing, but I have had experience of this Colony since 1898, and have seen miners (?) of all sorts and conditions come and go; they ranged all the way from chiropodists to real-estate boomers, but real miners have been few and far between. There has been but one serious effort made by Americans since I have known the Colony; this company is still here; it has prospected large areas containing high-grade bauxite and seems to be pleased with what has been found. So far this company spent around one million dollars on prospecting, obtaining ground, and construction. The gold-quartz possibilities have hardly been looked into, and what gold is produced has been won by hand-work from placers.

AN AMERICAN.

Paramaribo, September 18.

THE FAIRBANKS DISTRICT, in the Yukon basin, has produced over \$70,000,000 in gold and has been a source of considerable silver, lead, tungsten, and antimony. The conditions in the district in 1917 are reported in a paper by Theodore Chapin that forms part of Bulletin 692-F of the U. S. Geological Survey. Mr. Chapin gives an account of the operations at the gold and the silver-lead lodes and at the tungsten deposits.

A CAMP IN THE MALAY STATES

ROAD-MAKING IN UPPER BURMA

A CHINESE CROWD

TYPICAL KOREANS

Mining Engineering in the Orient

By GILMOUR E. BROWN

The Yangtze river, rising in the highlands of Thibet and flowing eastward through central China, divides that country into two nearly equal portions, the peoples of which experience difficulty, from time to time, in living in harmony. Peace delegates, quartered at Shanghai, have for more than a year attempted to adjust, with but little success, the differences existing between the military party of the North and the progressive party of the South.

When civil war was being waged, trains full of troops were in constant evidence moving to and from the scene of military operations, but trains of wounded were conspicuous by their absence, leading to the conclusion that the Chinese excel in conducting warfare on humane lines. China swarms with soldiers and these by appropriating the grain and foodstuffs of the peasants, without payment, have been the direct cause in several provinces of the rise and increase of brigandage.

The traveler makes his first acquaintance with the soldiers in the dining-car of the long-distance trains, for although there may be accommodation available in the second and third-class cars, that is not good enough for these 'braves'. It is not conducive to comfort during train-journeys to find these lousy bipeds reposing at length on and around the tables of the dining-car, spitting on everything and anything within range. The Chinese director of one of the railways, who is also a general in the Chinese army, could not persuade the soldiers on one occasion to give him a seat in the dining-car until he had changed into his general's uniform, a situation which the foreigners present appreciated with rare relish.

A few days after leaving the terminus of the railway

or steamer route the traveler will renew his acquaintance with the soldiers, for the magistrate of each district through which he passes will insist on the traveler taking an escort of from 4 to 50 soldiers, the number depending on the magistrate's estimate of the number of brigands along the proposed route, and of the importance of his visitor.

With some experience of the country, it is possible to slip away from the escort in the early morning, but that is denied the stranger. The traveler too has to pay the wages of the escort, amounting sometimes to half a peso per day for each man. These soldiers are armed with ancient rifles. I have seen some dated 1869; and it is probably respect for the age of their weapons that leads the Chinese soldier to fire always from the hip without any aim at all. Sometimes it will be found that only 10% or less of the abundant ammunition carried by the soldiers around their persons will fit their rifles; their martial appearance is supposed to overawe the brigands and afford thus the necessary protection. Two American railway engineers were captured by brigands about two years ago, one escaping after three weeks, the elder and chief of the party being released after five to six weeks captivity. Both suffered severely from the continual night marching to elude the pursuing soldiers and the lack of suitable palatable food. Far in the interior a few soldiers are useful in restraining the ever-present crowd, which assembles rapidly to see and stare at the foreigner, and to permit of the examination of surface mine-workings.

Without a few soldiers it is next to impossible to take a meal or a rest except in the midst of a crowd of rustics whose habits leave much to be desired. This is perhaps the most unpleasant feature of travel in the interior of China. Unfailing patience, good nature, a ready sense of humor, and an angelic temper are essential for such travel. In a province where the natives are not particularly friendly, it is wise to avoid the villages and stop over-night at hamlets just sufficiently large to house the caravan. The lack of privacy, the overwhelmingly nauseating smells, and the vile places in which one must sleep, all combine to get on the nerves of the traveler and weaken his self-control. Above all, no cause must be given for increasing the mob excitement by the use of force or the display of firearms.

Traveling in the northern part of China is more pleasant than south of the Yangtze, owing to the existence of roads along which it is possible to travel in carts, on horseback, or in a mule-litter, while the smells so characteristic of the South are neither so numerous nor so overwhelming. There are also fairly clean temples where one can rest in moderate comfort and privacy.

South of the Yangtze, roads, where any vehicle other than a wheelbarrow can travel, do not exist. Usually the road is from two to four feet wide, forming a dike between rice-fields and paved with flat stones showing the wear of centuries. Each farmer seems to have had the right to move the road around his patch of land just as he pleased, so that the frequent bends and right-angled

turns add from 20 to 30% to the time and length of the journey.

The Chinese are expert in the manipulation of a wheelbarrow and it is not an unusual sight in Shanghai to see from 10 to 12 Chinese women being conveyed home from their work in the cotton-mills on a single wheelbarrow. The traveler's baggage, however, is generally carried suspended across the shoulders of coolies, each coolie taking from 80 to 100 pounds and walking 20 to 25 miles daily.

The traveler himself in the southern part of China, while away from the rivers navigable by small junks, invariably travels in a sedan chair carried by two or four coolies. After three or four weeks of such a conveyance one makes up one's mind never again to grumble at a train being late or swear at the uncomfortable jolting of a mule.

The average Chinese, without as much as the flicker of an eyelid, can romance about his mine so as to lead the engineer into undertaking some unpleasant and barren side-trips.

Travel in Japan or Korea is as different from travel in China as the nebulous heaven of the missionaries differs from the vaporous hell of the same visionaries. The Japanese race is one of the cleanest as far as, and only as far as, personal cleanliness is concerned, while the women are neat, cheery, and pleasing to the eye. The Chinese peasant woman, on the other hand, with her stilted small feet, ungainly gait, trousers, flat figure, raucous voice, and lack of good looks is an outrage on womanhood.

The Japanese inns are neat and clean, but terribly cold in winter, particularly in the higher latitudes of Japan and Korea, where the Japanese persist in building houses of the type common in the more genial climate of southern Japan. All the traveler has to warm him in a room made up largely of doors, covered with rice-paper, and windows, are three or four tiny pieces of charcoal in the centre of a large pot of fine charcoal ash. Too close attention to the heating apparatus results in a vile headache accompanied by a lowering of the vitality through absorption of carbon monoxide in the blood.

The Korean, on the other hand, has developed a heating system similar to that used by the Chinese in their sleeping-floors, with the difference, however, that the Korean utilizes the waste heat from his kitchen-fire by leading it under the floor of his dwelling.

The bathing arrangements at the Japanese inns are certainly novel and extremely interesting to the student of nature.

Japan, three years ago, passed a law allowing only Japanese or judicial citizens of the Japanese empire to acquire prospecting licenses or mining leases in Korea, a contravention of treaty rights which drew a protest from America alone. Japan has not yet announced that this law applies to the Chinese territory of Manchuria.

In a previous article* I have dealt with the popular idea concerning the extent of the mineral resources of

*"Mine Development in China", "M. & S. P.", May 17, 1919.

A REST HOUSE

THE ESCORT

China and the difficulties encountered in carrying out mining operations there.

The Malay peninsula, extending from Burma to Singapore, is rich in metals, particularly tin and tungsten. The tin-tungsten belt begins in Eastern Burma and passes through Lower Burma, Lower Siam, most of the Malay States, ending finally in the Dutch islands of Banca and Billiton.

The real tropical jungle begins in Lower Burma and covers all the islands of the Malay archipelago as far as the south of Borneo and the Celebes. Exploration in such jungle is one of the most fascinating branches of professional work and at the same time one of the most risky, if precautionary measures with regard to health are neglected. Life in the towns of the tropics is not injurious to the health of men, but the traveler in the jungle is exposed to 101 dangers of which the town-dweller lives in ignorance, and it is necessary for him to be constantly on his guard.

Malarial fevers have to be continually contended against and lucky is he who escapes them. In moving into a district noted for its malaria it is advisable to fortify oneself a week or more beforehand by taking increasing doses of quinine until the blood reaches a state of saturation, and this should be maintained until a week or so after a return to civilization. Care has to be taken to prevent chills or other temporary illnesses likely to lower the vitality, which would have the effect of allowing the malarial microbes in the blood to get the upper hand.

If the traveler fails to take quinine, he is liable to be seriously ill when first attacked, and there is no more unpleasant situation than to lie in that condition alone in the jungle, days, or perhaps weeks, away from medical assistance. I am no arm-chair theorist, for I write from seven years experience in tropical work.

It is a curious but well-established fact that in the Malay States the swamp-land is often more healthy than the foot-hills. This is due to the presence in the ravines of the foot-hills of a mosquito carrying a deadly type of malaria. This is so well recognized in that country that

dwellings are now erected in the flat swampy land bordering the foot-hills.

Colonel Gorgas has shown that a mosquito rarely makes a flight of over 200 yards unless aided by the wind. By making a clearing around the permanent camp, and burning off the growth during the dry season, together with precautionary measures to prevent the mosquito from breeding in the near vicinity, it is possible to live in comparative comfort during rest hours. A little incense-burning under a table keeps the mosquitoes above the table, where they are more readily detected and killed. The Malays in some districts burn smoky fires under their dwellings at night to keep the swarms of mosquitoes away, but sleeping in such an atmosphere is far from pleasant. In some swamps the mosquitoes are so numerous during the day-time that life is almost unbearable, and it is necessary, if drilling in these swamps, to build several smoky fires around the drill-hole and to keep within the smoke-zone. When bathing in the rivers or streams, immunity from mosquitoes can be secured by the use of a strong carbolic soap.

The Malays make their dwellings on the banks of rivers or streams, and as these are more often polluted than otherwise, the traveler should make up his mind not to drink water except after it has been boiled, and to firmly adhere to this rule. While marching or moving camp, the best arrangement is to have the cook boil water in the evening, so that in the morning it has cooled sufficiently to allow of filling up thermos-flasks or water-bottles of sufficient capacity to last through the day. Passing through a Malay village nearly mature coconuts can be secured at any season of the year, and the milk from one of these makes a delightful and safe drink, particularly if made effervescent by the addition of a little brandy.

Physical fitness is essential to tropical exploration, for only in the vicinity of villages not far from the coast can any sort of conveyance be had, usually a cart drawn by two bullocks or water buffaloes moving only during the night hours at 1½ to 2 miles an hour. In Lower Siam or Burma, elephants can be hired cheaply to convey one to

the villages near the base of the mountains. They do not, however, make comfortable carriers.

Usually the traveler journeys up the rivers as far as he can in a dug-out; often it is possible to proceed in this leisurely fashion for a week or more, and then set out on foot for the mountains. The Malays cannot carry heavy loads and I have found it advisable to give each carrier only 30 to 45 pounds contained in a kerosene-tin, fitted with a lid to exclude rain, and strapped to the carrier's back. It is generally advisable to start at sunrise and end the day's march between 2 and 4 p.m.

In the jungle the sun is rarely seen through the tangle of vines and creepers around the high trees. The dark damp atmosphere, caused by absence of sunlight, is very depressing. A clearing on the banks of a stream should be chosen for camping, so as to get the benefit of the sun during the afternoon.

A small house, say, 10 by 8 ft., with a raised floor of saplings or sheets of bark, and sides and roof of bark or palm leaves, can be erected by half a dozen Malays in a few hours. In some jungles there is a low palm that has huge corrugated leaves, often 6 or 7 ft. long by $1\frac{1}{2}$ to 2 ft. wide, which furnishes excellent material for house-building.

All the inhabitants of the jungle travel along the lines of least resistance; that is the reason why when an elephant trumpets the alarm to the herd on detecting a human being, it is highly desirable to get off the track in the least possible time. The frog, too, travels along the track and so does the snake, in pursuit. When the snake catches up with the frog it coils up and sleeps until the period of digestion is over. Walking Indian file through the jungle, it is advisable to go third and enjoy to the full the efforts of the first two men to jump clear of the disturbed snake.

On beginning jungle work, one is apt to be scared by the snakes seen two or three times daily, and, in addition to wearing puttees, one should carry potassium permanganate and a hypodermic needle or sharp knife for treating bites. Familiarity breeds contempt, and these are soon discarded. With one or two exceptions, snakes will make way for the human being, but if there is any tendency to dispute the path a well-directed handful of the moist earth is usually a sufficient hint.

The Malayan tiger is a cat of sufficient size to earn respect but he is cowardly. He will not attack two men and rarely one while in motion during daylight. While walking alone, he becomes a nuisance from his constant attention, waiting for an opportunity to catch the traveler when his back is turned, or kneeling, or lying down. A tiny fire, however, keeps him away. In camp, particularly if sleeping in an open tent, a light should be kept burning during the night.

In some parts, leeches are numerous and constitute the real pest of the jungle. Puttees then are a necessity and constant care has to be taken to ensure that the leeches do not enter beneath one's clothing. They are usually small, about $1\frac{1}{2}$ inches long by $\frac{1}{8}$ of an inch in diameter, inflating with blood to over $\frac{1}{2}$ of an inch in

diameter. They leave sores difficult to heal and often bleeding freely for hours, particularly if the leech has been brushed off before finishing his meal. Siam pos-

BUILDING A HOUSE IN THE JUNGLE

sesses some huge water leeches, six inches or more in length, which are in such a hurry to get at the traveler that they will frequently attach themselves to iron or wooden articles held in the hand.

DRILLING IN THE JUNGLE

A strip of clean sand around the camp will keep snakes out, but it is highly desirable to raise the floor of the dwelling a few feet above the ground. This makes a healthier and cooler dwelling, with less likelihood, espe-

cially in the Malay States, of finding a scorpion in or beneath one's boots. A Malayan scorpion reaches seven or eight inches in length, and a sting means hell either here or below.

The most difficult work in the Malay archipelago is geological mapping, usually for oil, of the Tertiary strata forming the first high land to appear from beneath the extensive coastal plains. These strata are usually so soft that outcrops are rare and not easily found under the luxuriant growth. One well-known British geologist, the author of a book on oil-finding, gives his opinion that pitting to ascertain the inclination of strata is unnecessary and an indication of lack of technical ability. I have mapped lands in several parts of the East Indies where outcrops did not average one to the square mile, and he must indeed be a super-geologist who can work out other than the most simple structure from such scanty data. The jungle in such territory appears so dense and formidable that the young geologist, detailed to make an examination, is appalled at the magnitude of the task and the difficulty of determining where to make a beginning. The streams usually afford the only rock exposures, but after these have been examined and mapped a great deal may be deduced concerning the topography and geology of the district. If indications are encouraging, tracks are set out in a definite direction, determined by a study of the drainage system, and these are cut under contract by Malays or Dyaks throughout the area to be examined.

A small house for the geologist and another for his coolies are erected near streams every few miles and these made centres for detailed work. Finally, pits are sunk from 10 to 30 ft. deep to determine the inclination of the strata at important points and to allow of the completion of the geological picture.

It is a fairly strenuous life, but a little relaxation in the way of a hunt after wild pig or deer, or a chance encounter with a tiger, adds to the enjoyment of the life and relieves the monotony of living alone in the jungle.

THE COPPER PRODUCTION of Alaska in 1918 was 69,224,-951 lb., valued at \$17,098,563, according to a report just issued by the U. S. Geological Survey. This is less than the production in 1917, which was 88,793,400 lb., valued at \$24,240,598. The reduction in output is stated to be due to shortage of labor and ships. During the year 17 copper mines were operated, the same number as in 1917. A copper prospect on the Alaska Peninsula is under development, and interest still continues in the deposits of the Talkeetna and Broad Pass districts. The copper deposits in the Alaska range recently reported are still attracting attention, although little work has been done on them. The deposit of copper discovered in 1915 on Rainy creek, a tributary of the South Fork of Delta river, 7 miles above Miller's roadhouse, is said to be a large body of low-grade ore on which considerable cross-cutting has been done. There is also a low-grade copper deposit in the gulch $1\frac{1}{2}$ or 2 miles west of Paxson's roadhouse. A copper lode on McLaren river, tributary to

the Susitna, is said to be 10 ft. wide and of high grade. It was reported that an outfit was to be taken in on the snow in the winter of 1918-'19 to prospect this deposit.

Mining in Canton District, China

During the past year wolframite ore in China was mined and marketed in large quantities. The demand for tungsten-steel created by the War in the United States and Europe led to the general development of this ore. At present production has almost ceased, owing to the decline in price, which in some cases has become less than the cost of production. Shipments of ore were valued at 3,140,220 taels. Most of the veins are small, averaging about 2 inches in width. Mining the ore now requires extensive blasting. Antimony production has practically ceased, owing to the low price of the metal on the British and American markets. Most of the smelters are closed, the operators waiting for a better market price. As many of the antimony mines are remote from water transportation, the present low prevailing price wipes out all margin of profit.

Lead and copper have so far been mined in only a crude way to supply local needs. Most of the veins are small, and many difficulties exist in mining and transporting the ore. Iron ore is found in abundance in many districts favorably situated for water transportation and fuel. Some large deposits averaging 73% are known, with all necessary flux and fuel in the vicinity. A small amount of iron is being produced at present for native use. This product is a high grade of malleable iron and readily worked into agricultural tools. A small quantity is exported. Coal is found in many districts in Kwangtung Province and is mined in a small way. The many tests made show that the coal is of good quality for steaming or coking. The coal-mining industry requires only the investment of capital and favorable mining regulations to bring it up to a high state of production. Up the North River there is an abundance of a fragile semi-anthracite which is easily accessible. The analysis shows volatile matter 13%, fixed carbon 75%, ash 12%, and heat value 12,000 b. t. u. per pound.

Manganese is common in the Canton district, the deposits being large and easy of access. Due to the high freight-rates prevailing there has been no market for the metal. With favorable shipping conditions, there should be a good export trade in this mineral in the future. Molybdenum was produced in small quantities in many districts during the past year and marketed at good prices. The deposits of this metal are small and irregular, usually being found in pockets or stringers not more than 1 inch thick. Small quantities are also washed from alluvial sands. Graphite occurs in many places in small quantities, but no mining is being done. Lime is one of the common elements in the general formation of the mountains of Kwangtung Province, the limestone being bedded on a shale floor. Large quantities of the purer limestone are exported and some is used locally in the manufacture of cement.

Patents and Progress

By WILLIAM E. GREENAWALT

INTRODUCTION. Much has recently been written in the technical press about the use and abuse of patents. It is curious how the various suggestions for improving the patent laws, or for remedying existing evils, are patronizing to the inventors or savor of a socialistic readjustment. This attitude is usually limited to patentees of inventions. No attempt is ordinarily made to make the remedy conform with other laws pertaining to property or possession. Any readjustment that is not justly a part of a comprehensive whole cannot possibly stand the test of time. Special legislation is never a success. Patented inventions are no different from other forms of property, and the general laws that govern one form of property should govern every other form.

PATENTS AS MONOPOLIES. A great deal of confusion arises as to the nature of a patent. Only the ignorant, however, consider a patent as a monopoly. A patent, *per se*, is not in the nature of a monopoly, as the term is ordinarily understood. It is, to be sure, an exclusive possession, the same as a house, a mine, or a factory may be an exclusive possession, but exclusive possession of such a character is not a monopoly. If, however, all valuable patents bearing on a particular art are brought under one control or community of interest, then patents may become a monopoly. But this does not differ from other monopolies. The evils are the same; the remedy should be the same. One form of monopoly is as objectionable as another. All are opposed to the American ideals of government and of justice.

PATENTS AS PROPERTY. An invention is intellectual property, and a patent for the invention is the same as a deed to a lot or a mine. The conditions for acquiring possessory rights to an invention are much the same as for acquiring possessory rights to a mineral deposit. Both are grants from the Government. There is this vital difference, however, that it is vastly more difficult to obtain a patent for an invention than to obtain a patent for a mineral deposit. If an inventor applies for a patent the literature and the patent-office records of the entire world are ransacked to be sure that the applicant is the first and original discoverer of the invention. He must be the original discoverer. An applicant for a patent to a mineral deposit need not be the discoverer. The deposit may have been discovered, located, and abandoned any number of times, and yet the applicant for a patent can get valid title. If the same laws were to apply to the patenting of a mineral deposit that apply to the patenting of an invention, then a mineral deposit once discovered or located, would never again be open to valid location and possession; it would be public property forever. A patentee for an invention gets possessory rights for 17 years; the patentee

of a mineral deposit, timber lands, or homestead, gets possession forever. Material property is more readily defined than intellectual property, and it is evidently for this reason that all kinds of erratic suggestions are made for governing patented inventions.

SOCIALISM AS A CURE. Strange as it may seem, many who are apparently opposed to any form of Socialism advocate socializing of patent privileges. It has frequently been suggested that the working of patents should be compulsory after a short period and that in some cases the Commissioner of Patents should have the authority, under certain conditions, to issue licenses in the event of disagreement or obstinacy of the patentee. This is practically the present condition in Canada. Surely the patentee of an invention should have as much right to his intellectual property as the patentee of a valuable mineral deposit. If a suggestion were to be made that all patented mineral deposits be subjected to the same conditions to which it is proposed to subject patented inventions, the cry would not be "Socialism" but "Bolshevism". It is not unusual for some men or interests to hold over a hundred patented mineral claims. Would those who advocate working of patented inventions also advocate the working of all the patented mining claims under the same conditions? If they did, and such a law were passed, it is certain that ownership of most of the patented claims would be jeopardized. It would certainly be the cause of endless litigation.

PATENTED INVENTIONS AS PROSPECTS. A patent for an invention is a prospect when the patent is applied for; it is not a finished product. Many additional patents may be necessary to protect the inventor in the practical development of his germ idea. How could an inventor comply with a working condition for, say, 15 years on all the patents necessary to adequately protect his invention? It would simply mean that inventors, who are usually poor, could not protect their rights and most patents could be brought into litigation, and the inventor robbed of what little rights he has.

POVERTY AND PATENTS. Most of the great inventions have been produced by men in straightened circumstances. Few epoch-making inventions, in any art, were conceived by men of wealth, or as the result of research work by large corporations. This statement may seem far-fetched, but its truth will be clear on due consideration. Pioneer inventions are always the result of prolonged meditation. By meditation is meant the intense dwelling, in thought, upon an idea or theme, with the object of thoroughly comprehending it. Imagine the boss coming around and finding his research chemist or electrician with his feet on his desk and 'meditating', and especially if this were necessary for years, and then

not with the certainty that the problem would be solved. Research may state the conditions of a problem, but only meditation will solve it. The man who has a competent income is not likely to spend years of his time meditating when there is a good time waiting for him in travel, dinners, and entertainment. Invention means sacrifice.

THE SOCIALISTIC ELEMENT IN U. S. LAWS. Few people realize the socialistic element, either actual or implied, in the laws of the United States that vitally affect a large proportion of the population. Some of the conditions are not only socialistic: they are positively bolshevistic. Take, for example, the case of a scientist—a doctor, let us say—who may spend a life-time and a fortune in the quest of a cure for tuberculosis, and is successful. According to the laws of the United States such a man could not obtain any protection for his discovery, nor could he get any reimbursement for his expenditures. He is positively compelled to become a public benefactor, even if he is brought to poverty. The medical profession would also consider it unethical for him to withhold his discovery or exploit it for a selfish end. Similarly, an inventor may evolve practical ideas that may revolutionize an industry or change the status or the outlook of a nation. At the end of 17 years all exclusive rights to his invention cease: it is declared public property. He has no asset, even, in the large sums expended to give his invention practical application. The scientist and the inventor are laboring under ultra (not ‘anti’) -bolshevistic conditions. The bolshevistic principle appears to be, “What is yours is mine, and what is mine is yours”. Scientists and inventors are laboring under the adverse conditions, which assume that “What is yours is mine, and what is mine is my own”. Under present conditions, the thief who steals millions under the shadow of legality and the heir who inherits unearned millions as a privilege have infinite rights as compared with the highest type of workers that America has yet produced. It is always argued that the patentee, for example, has a monopoly of his invention for 17 years: that may be true, but so, for example, has the locator of mineral or other lands, and of the two the owner of the patented lands is more likely to realize adequate returns during the first 17 years than the owner of a patented invention. It usually takes from five to ten years to develop a good mine: it takes about the same to develop a good invention. The expenditure made to develop a mine or homestead is a more or less permanent asset: the expenditure made in developing an invention is entirely lost when the patent expires. At the end of 17 years, for example, the Government takes the patentee’s invention, say, of mining and metallurgical machinery, and hands it over to the patentee of a mine, as a public benefaction. The inventor is deprived not only of his invention but practically also of the entire investment incurred in bringing the invention to profitable operation. The patentee of a mine not only has his original investment intact, but the value of his mine is greatly increased by the enforced benefaction of the inventor. “Verily, to him that hath shall be

given and to him that hath not”—you know the rest.

PROPOSED LEGISLATION. The Patent-Office is now asking for an enlargement of its powers. It should be given everything it has asked for. It has not asked for enough. In addition to the powers the Commissioner already has, they should, under certain conditions, be enlarged to stimulate invention. It is quite conceivable how the Government might with advantage to itself, and to inventors, assist in a small way in proving up the essentials of meritorious inventions, if an inventor can convince a board of inquiry of its probable merits. Think of the time, the money, and the litigation that might have been saved if Everson and Kirby could have had a little assistance in developing their inventions: for it must be evident to anyone that while the disclosure in the Everson and Kirby patent is somewhat indefinite, all the elements are there, and a little additional work would no doubt have evolved all that is necessary in modern flotation.

A great deal of money is spent annually by the Government in agricultural investigations for the benefit of the farmers; in the Geological Survey and the Bureau of Mines for the benefit of the miner; in river and harbor improvements for the benefit of commerce; would it be so awfully preposterous if the Government were to spend a little for the benefit of inventors? Objection might be made on the basis that many inventions do not merit any expenditure. That may be true. But a great deal of money is also spent in giving young men high-school and college educations: not all of these justify the expenditure. We all know, of course, that Emerson said he did not believe in educating fools at college, but Emerson, like other philosophers, gave us a lot of platitudes while failing to touch the essence: He did not tell us how to distinguish the fools. That is the real difficulty; just as the real difficulty is in distinguishing a meritorious invention from a worthless one. The best men in history have at times been classed as fools; the best inventions, in their undeveloped stage, as worthless; and the best mines, when prospects, as lacking in merit. In cases of reasonable doubt, nothing will decide the issue but the results under fair demonstration. Whatever assistance the Government might give inventors, it should not be on the basis of charity. It might take the form of well-equipped laboratories in various parts of the country with every facility for testing inventions on a small scale at cost. At the present time the Patent-Office is not even provided with an adequate laboratory to facilitate its own work.

A TECHNICAL APPELLATE TRIBUNAL. One of the reforms contemplated in the proposed Patent-Office legislation, and one which is urgently needed, is a technical appellate tribunal of last resort to review patent cases, both of the courts and of the Patent-Office. The recent decisions of the U. S. Supreme Court in the flotation litigation emphasize the need for this. Their indefiniteness showed lack of sufficient technical knowledge. A second decision was necessary to interpret the first, and a third decision will be necessary to fully determine the second. The uncertainty of the “oil” and the “fraction

of 1%'' in the first decision were settled in the second, but it is quite certain that at least another decision will ultimately be necessary to interpret the matter of "agitation". All of these issues should have been clearly defined in the first decision, and no one doubts but that a tribunal of legally trained technical men could have rendered such a decision, especially if one or two of the judges had been technical experts in the flotation art. The best judges of an appellate court are probably as limited in their grasp of technical matters as the best trained technical men are informed on matters of law, and it is not likely that any member of an appellate court would want to take a chance on the decision of well-informed technical men on points of law.

It is perhaps egotistical human nature that inclines a scientist to think he is capable of passing upon all matters of religion: an inventor to think he is competent to pass on all matters of law and ethics: a preacher to think he is competent to pass on all matters of politics: and a lawyer to think he is competent to pass on everything. A legal training does not make a man omniscient. It may afflict him with myopia.

In most cases of patent litigation an appellate tribunal is supposed simply to pass upon the law, but the law is easy when the facts are made clear. Nine-tenths of the difficulties in all patent controversies lie in differentiating one invention from another and from the prior art, and the men most capable of doing this are men skilled in the particular art to which the controversy pertains. A man skilled in optics would be a poor judge in controversies pertaining to chemical processes, and the chemist would not be a fit judge on electrical inventions; still, either of them would probably be as good or better than a lawyer with no special scientific or technical training.

In all technical and scientific litigation, it would seem the course of prudence and justice to have at least one or two men on the bench in important cases, men familiar with the practical details of the art to which the litigation pertains. It would not be necessary, nor would it be desirable, that the technical men should be permanent members of the court; but, rather, floating members, familiar with the details of the art pertaining to the specific case under review. The floating members of the court could be selected by the permanent members, either from a list submitted by the litigants, or with the approval of both litigants. Such a court should have the right to call independent experts, if desired, at any stage of the proceedings, but the experts so called should be subject to examination and cross-examination, like any other witnesses. It seems most unfortunate, under present conditions, that matters which may be vital to an intelligent decision cannot be considered because, either through neglect or misunderstanding, they were not included in the original testimony. An inventor would mend his fences as he goes along and get all the information he could to arrive at the desired end, but no additional light can be thrown on patent litigation after taking of the original testimony, even though the new information would be conclusive and enable the Court to arrive at a fair decision.

The Court is the slave of precedent, and not infrequently it is obliged to give an unfair decision when additional testimony or evidence might aid justice. It is more than likely that the Supreme Court was hampered in both of its flotation decisions through this foolish custom. Invention involves advanced art, and if the judges want enlightenment on certain phases of a case, they should have the right to call for additional testimony to clear up obscure points.

In important cases, the patent Court of Appeals should have at least two technically trained men, expert in the art under consideration, and these expert judges should have the same responsibility as the regular judges composing the Court. They should not be regarded merely as technical advisers. When the technical and scientific facts in any patent litigation are clearly analyzed, the law pertaining to it is greatly simplified. No one could get a job in the Patent-Office as a primary examiner who has not got an extensive knowledge of the technicalities of the art in which he expects to work. Many, if not most, of the primary examiners are technical men first and get their legal training afterward. This is as it should be. In an appellate court no special technical training of any kind seems to be necessary to give important decisions. This is as it should not be. No judge can give an intelligent decision without a thorough knowledge of the art to which the case pertains. The primary examiner, equipped with the special technical knowledge of his department, is usually more capable of giving a fair decision in contested cases than an appellate judge, who has no special qualification for this highly specialized work.

No amount of skill and knowledge on the part of the primary examiner will obviate all patent litigation. The fault is not with the Patent-Office, but rather in the inherent nature of things. No invention is born in all its perfection out of a clear sky. The germ idea, with all of its haziness and impracticability, comes first, and then comes a long process of evolution. The inventor seeks to protect himself in the development of his work, and, necessarily, he cannot realize with any definiteness the scope, the limitations, and the possibilities of his invention. And if he does not and cannot fully realize it himself, the Patent-Office should not be expected to see what the inventor himself cannot see. The result is, that many patents and patent applications suffer for want of definition, and there is no remedy for this difficulty. How, for example, could a primary examiner avoid litigation on the flotation patents, when no two courts agreed on the merits of the case, and when the U. S. Supreme Court had to interpret its own first decision? In case of reasonable doubt the Patent-Office is right in allowing an application to issue. It is time enough to litigate a patent if it is worth while litigating. Litigation, however, should be greatly facilitated.

AMERICAN AND FOREIGN PATENTS. The patent laws of the United States are essentially fair, fairer than those of any other country. Many countries have working conditions with which few foreigners can comply. Usually the least progressive nations have the most

drastic patent laws. Such countries seem to think that they gain by making conditions so that patents are easily forfeited and then become a public asset. As a matter of fact the asset is destroyed with the forfeiture of the patent. No one is going to exploit a patent purely for the benefit of the public. In all cases the incentive is the reward, if successful, and no one would be unwise enough to go through the agony and pitfalls of developing a new invention with the incentive removed. Even if an invention has been successfully developed in one country, there is always danger of subsidiary patents in introducing it into another country.

No conditions should be attached to an American patent, for citizens of the United States, that would make forfeiture probable within the 17 years of the life of the patent. Few men have done so much for the country as the inventors, and few have got less for what they have done. Our patent laws should be severe on all foreigners whose countries have laws more drastic than those of the United States. Foreigners from such countries should be required to pay a patent fee in the United States equal to the fee in their own country: if their country has a working clause, the same condition should be required: if a tax, a tax should be required: if a limitation of royalties, the royalties should also be limited in the United States. This would tend to make patent laws uniform in all countries. As it is now, a citizen of the United States, in his own country, has got to contend against all the inventors of other countries, while not having any tangible privilege in return. A foreign patent must usually be applied for before the American patent is demonstrated. Few inventors can take the risk, and few are in a position to maintain the working conditions and taxes frequently attached to foreign patents. The best way, of course, would be to have a satisfactory international agreement, but that would appear hopeless if taken up through the regular diplomatic channels. It is not likely that any beneficial results will be realized, by the patentees of the present generation, through diplomatic channels. It is possible that it could be realized through the League of Nations.

PIRATICAL LITIGATION. A remedy should be provided for the protection of patentees from piratical litigation. Patentees, as a rule, are in no position to defend their rights against such tactics. A highwayman is a gentleman compared with the man who will force a patentee into unjustifiable litigation, and then get possession of his patents for a nominal sum through a forced compromise. This is a common proceeding for those who want to acquire a patent monopoly. Such questionable proceedings usually go under the high-sounding name of "business sagacity"; they should go under the name of "legalized theft". Law and justice may at times be total strangers: they may not even recognize each other when face to face in the courts. Most patentees are unable to get financial aid to develop their invention if the patents are brought into unjustifiable litigation, and most shrewd patent attorneys can bring almost any patent into question.

The mere fact that a patent is in litigation does irreparable harm to the patentee, even though his patents are justly unassailable. The moment a patent is brought into litigation, justly or unjustly, the patentee is practically put out of business, because few, if any prospective interested parties will have anything to do with patents that might at any time make them a party to the litigation, and they are hardly ever concerned with the merits of the case. If the patents are ultimately vindicated, there is nothing left but the hollow shell; the patentee cannot come back and sue for damages on business he might have had but did not get.

DIFFICULTY IN EXPLOITING INVENTIONS. It is not an easy matter to get large financial interests to adopt, or to thoroughly test new ideas, if patented. This usually compels an inventor to organize a company for the exploitation and development of his invention, in which he usually has a small or minority interest. Such companies are heavily capitalized, not only for the exploitation of the invention, but also to protect them against piratical litigation. If the venture is successful, large salaries have to be paid and large dividends are expected on a large capitalization. Manifestly, royalties or compensation that would be satisfactory to the inventor would not meet the demands of a heavily capitalized company, and if a royalty charge is made to meet all conditions, the royalties must, necessarily, be large. Companies controlling valuable patents are just the same as companies controlling valuable mineral lands, or manufacturing enterprises, for example: they want what they can get out of it. If the royalties are excessive, no fault should be found with the inventor, for in most cases the inventor had no alternative; and no fault should be found with the companies controlling the patents, for they are doing what other companies do under similar conditions.

Everyone understands, of course, that all the patented schemes presented for consideration to the larger financial interests are not promising. Neither are all mining prospects, nor any other enterprises in embryo. It is quite safe to say that any expert to whom a patented process is referred, could safely turn down 95% to 98%, and be right, without even knowing anything about them, and still get a reputation for sagacity and discrimination. In doing so, unless he is unbiased and investigates carefully, he will also turn down the other 2 or 5%, which have merit, and later find that something of value has been overlooked. Such cases can be recalled without going into ancient history, and yet, in the metallurgical art, at least, these have come into great prominence in the last few years. It is probably true that every meritorious invention has been repeatedly turned down by leaders in the art to which it pertains. If then, the inventor persists and attains success and a high royalty charge is made necessary, no fault should be found with the patentee: he is entitled to what he gets, and he never gets anything he has not earned. It is not until after he has made a success that the literature of the entire world is ransacked to discredit him.

Within the last few years, however, some of the best

and largest companies have adopted a more liberal attitude toward patentees. Many of them feel that an inventor who presents anything worth while is entitled to fair compensation, even if his patents are not altogether impregnable. They feel that a liberal policy is the best in the end.

RIGHTS AND PRIVILEGES. Most of the present social and political unrest in the United States is due to the perpetuation of large fortunes. The American political doctrine of the Declaration of Independence, that "all men are created free and equal", may have been a living thing in 1776; it sounds like mockery in 1919. In the race for wealth, which seems to be the measure of success according to our present standards, it is not the keenest of intellects that wins. A turtle may win in a race with a greyhound if given sufficient advantage.

Wealth is not a true measure of worth: if it were, many of the scientists, the doctors, the lawyers, statesmen, inventors, preachers, and even the presidents of the United States would be among the wealthiest of men instead of being among the poorest. It does not require a vivid imagination to see the skeleton hand of the ghost of a dead millionaire coming out of the forgotten past and taking the scientist, the inventor, and other enforced public benefactors by the throat and saying to them, "Because ages ago I acquired a vast fortune either by intent or accident, honorably or otherwise, you and your posterity shall forever contribute of their earnings to support my posterity in ever-increasing opulence, power, and luxury". Humanity, after all, is more or less of a joke.

Probably 75% of all the social and political unrest could, in time, be eliminated by one simple law. The remedy is a drastic inheritance tax. The idea is old, and many of the best economists and jurists have favored it. Was it not Carnegie who said that "the man who dies rich dies disgraced"? Surely if it is right to deny the scientist any possessory rights to his discoveries or even his expenditures incidental thereto; surely if it is right to completely wipe out the property privilege of the inventor and patentee at the end of 17 years; surely if it is right to deprive the author and the musician of the exclusive possession of their compositions at the end of 28 years, it should not be wrong to enact a drastic inheritance tax to deprive the dead of something they can no longer use. Inheritance is a privilege; not a right. It is a privilege, exactly the same as a patented invention or a copyright, and if it is right to completely annihilate patents and copyrights during the life-time of the inventors and authors, it should not be wrong to greatly curtail the privilege of conveying property to others, by those who can no longer use it and to those who never lifted a finger to earn it. The American idea is, that a man should have what he earns; but the converse of this should also be stated: he should be made to earn what he gets.

Many attempts have been made to analyze the cause of the present social and political unrest. Many good thinkers believe that the material development of the world is too far in advance of the spiritual and political

development. This is probably a good guess. To the average preacher there can be no new revelation. To the average politician, what is not tried is not true. If the material advancement exceeds the spiritual and political advancement, it may be attributed to past and present laws. How much material progress could have been made if the privilege of exploiting a scientific discovery or a patented invention were granted forever? The world is sick and suffering from inheritance privileges, whether of political power or of wealth, for, in the last analysis, they are the same.

It is a curious fact that in all political controversies between capital and labor, only organized capital and organized labor is invited to the conference. The man in the middle, the professional man, the lawyer, the educator, the doctor, the inventor, the small miner, the small manufacturer, the retailer, the farmer, who are slowly but surely being ground to death between the two great millstones of organized capital and organized labor, are not even asked for an expression of opinion as to what manner of death they shall die. Even the President of the United States in his recent call for a conference between capital and labor practically ignored both unorganized capital and unorganized labor. If present conditions continue, the people in between, who may be either capital or labor, will soon be a thing of the past. There will then be left only organized capital and organized labor. And after that? No, not the deluge, but a new and better order of things. Humanity is moving forward, not backward.

ONE OF THE few places where a plant has already been installed for the distillation of oil from shale is near Dillon, Montana. The shale at the site selected for the operations is a part of the Phosphoria formation, which contains the beds of rock phosphate that are mined at several places near Bear Lake, in south-eastern Idaho, for the manufacture of fertilizer. Phosphate beds are also associated with this shale in the vicinity of Dillon, and although they are neither so thick nor so rich as the beds in south-eastern Idaho they have some prospective value. Soon after it became known that there was shale in the Dillon region from which oil could be distilled certain promoters began to organize companies to drill for oil in that region, and the search has been carried on persistently in spite of the fact that the geologic conditions there are almost wholly unfavorable to the occurrence of oil.

The first of these oil-shale beds was first brought to the attention of the public in a report by C. F. Bowen, published in 1918 as Bulletin 661 of the U. S. Geological Survey. A more detailed examination of these phosphatic shales and of beds of other formations that may contain oil shale was made late in 1918 by D. Dale Condit, whose report has just been published by the Survey as Bulletin 711-B, which is entitled 'Oil shale in western Montana, south-eastern Idaho, and adjacent parts of Wyoming and Utah'. Copies of this report may be obtained on application to the Director of the U. S. Geological Survey at Washington, D. C.

The Economic Education of Labor

By EDWARD A. BRADFORD

"Experience keeps a dear school, but fools will learn in no other." The organized labor of our times is far from being composed of fools, but they are showing a preference for learning from experience rather than from books or counsel. They were graduated from the primary state when the spokesmen for the Railway Brotherhoods announced their discovery that increases of wages were not satisfactory, since the money had to be paid into the profits and costs of those from whom labor must buy the goods it needs to live on, and the process was repeated as often as wages were raised. What the Brotherhoods preferred was a reduction in the cost of living, so that they could keep some of the increased wages, and still have their share of the good things of life.

Even this primary lesson has not been learned by all labor, judging by the current statements that never were there so many strikes at one time as just now. The Federal Department of Labor has officially reported that in 1916-'7-'8 there were 11,092 strikes, and most of them in this neighborhood. In 1918 the New York State Industrial Commission reported that there were working days enough to make forty-eight centuries lost in strikes, and more still in 1917. If there are now more strikes than in wartime there is the greater need of labor's learning its second lesson in economics of how to get more for its wages, rather than how to get more wages. The second lesson, like the first, may be learned either from the books or by experience, and the wisdom of labor will be judged by its choice.

The essence of the first lesson of labor in economics is that wages, costs, and prices are so interrelated that when one is increased the other must be, too, if the accounts are not to show a debit balance. That is still in process of proof in our local traction strikes, after having been demonstrated to the Interstate Commission, and to Congress, respecting the steam railways. The budget-keeping of the families of the strikers is no different in principle, and the second lesson for labor to learn in economics is how it may have more satisfaction without losing the wages won by so many years of strife.

Costs and prices are related to production as well as to wages, and if production is increased costs are reduced. Then prices will be reduced by all except profiteers, and they will be hunted out of business and into jail. This seems to be a hard lesson for labor, since most present strikes are for reduction of time as well as for increase of wages. Most production nowadays is by machinery, and if machinery works slower, or shorter hours, the out-

put is correspondingly reduced. That is also true in industries where output depends on hand labor.

The steam-railway firemen now are demanding installment of machinery to save their labor, as well as for other betterments of working conditions. That is only one example of how labor increases costs for capital, while also contending that "labor produces all and should have all it produces." Since the industrial revolution labor is reckoned by horse-power rather than by man-power. That is only another way of saying that capital saves man-power by providing a substitute. It would only be fair play that labor should spare capital unnecessary costs by using cheerfully in production the machinery which capital provides. The demand by the firemen for labor-saving machinery shows progress, for labor consistently for centuries has opposed the introduction of machinery on the ground that the introduction of machinery makes muscle-power unnecessary.

The books teach to the contrary. Thus, John Stuart Mill, one of the apostles of the dreary science, which labor prefers to learn by experience, said fifty years ago: "It is questionable if all the mechanical inventions made yet have lightened the day's toil of any human being." Labor-saving investments of capital make more work than they save. The reason is that human wants are infinite, and that there are new wants for every satisfaction supplied. It is said that Wall Street speculation will absorb all money allowed it. Just so the demand for goods will absorb all the labor in existence, and there never can be overproduction of consumable goods.

Labor gives signs of appreciating this in its insatiable and insistent demands for more goods for its wages, and then gives signs of ignorance of how best to attain that end by slacking in working hours, and by demanding shorter days. Thus the painters are asking for a five-day week besides higher wages, and the silk-mill operatives, after agreeing on wages, asked for both more pay and for shorter days. This is a failing of human nature rather than a proof of ignorance of economics by American labor. Thus the British Premier, in his speech last week regarding reconstruction after the War, said that labor's argument that production increased with the reduction of overwork, was not true. "There has been a substantial reduction in the hours of labor, and it has been found that the output has been reduced almost in the same mathematical proportion. It is a dangerous fallacy that the less men worked the more work there would be for others, and it is highly important for those having influence with the workers to do their utmost to explode this fallacy."

*From 'The Annalist'.

American experience has been to the same effect. The

National Industrial Conference reported in June the results of an investigation of the hours of maximum production in the metal industries. Even a 50-hour week "could not be universally adopted by these industries without some loss of production." If management and workers actively co-operated a 48-hour week could be used more generally, but "the general adoption of a 48-hour week in the metal trades would involve a serious economic loss to the nation." Of 66 establishments which reported reduction to a 50-hour week, "4 reported production as increased, 28 as maintained, and 34 as reduced." In March a similar report was made for the silk industry, to the effect that the point of maximum production is "somewhat nearer 50 hours than 54 hours per week." The silk workers are taking rather than asking for a 44-hour week. Shortening hours is less hindrance to production in the silk industry than in the cotton and wool, for the reason that the skill required is greater, and there is a greater opportunity for the worker to influence production by personal effort. In the wool industry production was maintained in only a small proportion of cases when time was reduced to 54 hours. In the cotton industries reduction to 54 hours "almost invariably involved a loss in production, and usually a substantial loss." When hours are shortened piece-workers maintain output, but time-workers reduce output.

It is useless to multiply proof of so plain a proposition as that it is not possible to raise wages to the maximum record and shorten hours, without increasing costs, reducing production, and defeating the object for which labor is striking while learning by experience. The present movement for easing the conditions of labor is cloaked as a movement for social betterment, and for humanity toward excess of work to a degree harmful to health and life, and therefore detrimental to society. So far as the movement is honest it is justified, but there is constant need of care lest it be perverted to the uses of the slackers rather than to those of true lovers of their fellow-men.

Where there have been cases of real excess of labor, as in the steel and coal trades, there has been reform, and even of reform to excess in the opinion of many workers, who would have preferred the larger pay with the longer hours. But industry should not be speeded up to the capacity of the strongest, any more than it should be slowed down to sub-standard capacity. Society needs all that can be produced without social detriment at all times, but especially when war has removed from production fifty million workers, and will return to industry less than half of them, many as cripples. For the next few years, at least, there is urgent need of the greatest possible output by all capable workers, regardless of sex or age. In no other way can there be such production of goods that supply shall exceed demand, and the overstocked market shall reduce its prices. All human wants will not be satisfied then, but the reduction of prices will do more to meet labor's demands for satisfactions within its wages than strikes for more pay and higher pay.

Experience and the books suggest an alternative. In-

stead of inflation of goods—as desirable as inflation of money is objectionable—it is possible to break the price level by contraction of industry. Contraction of currency or credit is sometimes desirable, but painful, and always less so than contraction of industry. No able-bodied man need be idle now, and locomotive engineers are earning more than Governors of a baker's dozen of States. The disproportion between the pay of workers with hand and brain was never so great as now, and overpaid muscle is showing its brains by buying garments unsuitable for its daily life, such as silk shirts for negro field-hands or coal miners, and costly cars for iron-workers, while professors, colonels, and admirals are not able to keep their families comfortably, or sometimes even decently. But when industry is reduced by contraction those who now are troubled how to spend their money will be troubled to find jobs to earn wages to meet more modest wants. When contraction of industry is carried to the soup-kitchen stage, as it has been before, labor will once more have learned by experience that it is better to supply its wants by working to over-supply the goods market rather than by contracting the demand. Labor has its choice, but there is no third way.

There are two current examples of contraction of the demand for goods. Both are abnormal, because due to the War, but they illustrate how severe is the method of reducing demand to supply, rather than increasing supply to demand. Germany was so thoroughly blockaded and finally beaten that it was about the neediest nation, and for that reason emerges from the War among the most industrious. The cable has reported a Government proposal for a compulsory 10-hour day, with no maximum, and one hour as a gift to the Government. In that way Germany may yet win in peace what she lost in war. Industrially Italy is poorer than Germany, but she is rich in man-power, and the cable reports that several groups of railway-workers—will wonders ever cease!—have offered to the Premier to increase their hours of service in order to increase national production. During war there was no nation without examples of even greater sacrifices in all ranks of life, but where is there another example like Italy's in peace? Contrast with that, not merely our strikes, but even the declarations of our most conservative labor leaders.

Addressing the Pan American Conference, Mr. Gompers said that this time wages would not be reduced and hours lengthened, as has been the custom in every crisis, industrial, economic, or financial. That has been the custom of employers as their remedy for the misery of the people. With the understanding of the responsibility of his words he gave notice that the American workers will not be forced back by all the Bourbons in the United States. The time has come when the workers have new rights and advantages, and are going to enjoy the better times for which the whole world has been in a convulsion. Mr. Gompers declared that the Allies, conquerors in war, would extend throughout the world the advantages which their workers had enjoyed by wartime inflation, and the Republican Publicity Association en-

dorsed his declaration. Many would like to see that aspiration realized, but experience causes doubts. Never have prices remained long at any maximum. Always there has been reaction and reduction, and almost always by contraction. Now the statesmen of the world are pressing the alternative of inflation of production to match the inflation of the wage scale and the money scale.

There are sure and simple tests to decide whether strikes are meritorious in the public and individual interest, or whether they are motivated by a predatory spirit of domination by combination. Strikers who ask both higher wages, and hours shorter than average workers are easily capable of doing, are coveting what they do not earn, and what they are not entitled to have without earning. It is a common fault, not calling for surprise or censorious comment, but the demand is not one to be conceded at sight. There may be others worse off than such strikers, and, therefore, more deserving of a helping hand if willing to help the public in turn by doing what others decline. The sign of that is that such strikers seek by threats and violence to prevent others from taking the jobs they abandon.

There is no objection to workers leaving work because underpaid. The laborer is worthy of all the hire he can command. But this is the privilege of all, not of unionists alone. Consumers have rights as well as producers, and in particular the right to get for their dollars all that they should command in a free market for both labor and goods. When the labor market is shut, or controlled by a combination for restraint of production, and increase of wages by duress, there is a case for the assertion of the law against domination by conspiracy under the guise of humanity. When strikes are followed by disorder it is almost sure proof that they are contrary to both law and public interest.

Mining in Utah in 1919

The metal output of Utah was seriously retarded during the first half of 1919 not only by the lower prices of copper, lead, and zinc that followed the curtailment of demand, but also by a labor strike at Park City. The State's output of gold, silver, copper, lead, and zinc in 1918, valued at \$86,047,597, showed a decrease from \$99,328,155 in 1917. Even if mining conditions improve considerably, output of all these metals will decrease in 1919. The smelters at Murray, Midvale, Garfield, and International remained active, but many of the furnaces at each of these plants were idle.

GOLD. The value of the output of gold in Utah in 1918 was \$2,949,170, a decrease from \$3,355,156 in 1917. Most of the gold mines in 1918 came from the three main districts—Bingham, Tintic, and Park City—which produced, respectively, \$2,056,005, \$678,952, and \$82,461 in gold. These totals were less than those for 1917, and those for 1919 will show a further reduction on account of a decrease in the shipments of ore.

SILVER. The output of silver in 1918 was 13,455,597 oz., averaging \$1 per oz., nearly equaling the output in

1917. About half of the silver (6,681,644 oz.) came from the Tintic district, which was followed by the Park City region, with 2,572,586 oz., and the Bingham district, with 2,056,005 oz. There was an increase of over a million ounces of silver from mines in the Tintic region, due largely to the high average silver content of the ores shipped from the Chief Consolidated and Tintic Standard mines. Park City and Bingham districts both had decreased outputs of silver, and in 1919 there will probably be further decreases in the output of these two districts, due to the prolonged labor strike at Park City and the curtailed production of copper at Bingham. There should, however, be no change in the Tintic district, because a new railroad branch now under construction will give the mines in the eastern end of the district increased facilities before the end of 1919.

COPPER. Utah is credited with 227,169,630 lb. of copper, valued at \$56,110,899, in 1918, showing a slight decrease from the output of 1917. There is a prospect of a decided decrease in the output of copper in 1919 on account of the reduced price of the metal, which was 15c. per pound in March. After March there was a general curtailment of production, especially at the Utah Copper property, which is the largest producer of copper in the State, having yielded in 1918 about 85% of the total. The production of this company for the first quarter of 1919 was 60% of that for the last quarter of 1918, and the average monthly output for the first five months was 9,500,000 lb. Improvements are being made at the two concentration mills of the Utah Copper Co., one of which has been closed since March. In 1918 the Bingham district produced 211,194,861 lb. of copper and was followed by the Tintic district, with 6,568,802 pounds.

LEAD. The output of lead decreased from 178,521,958 lb. in 1917 to 167,008,224 lb. in 1918. The Bingham district produced 79,773,150 lb. of lead and was followed by the Tintic district, with 30,652,355 lb. and the Park City region, with 24,320,074 lb. As the price fell to about 5c. per lb. in May 1919, and the Park City mines were idle nearly two months on account of a labor strike, these totals will probably be greatly reduced for the current year. In February the Utah Apex Mining Co., a producer of both lead and zinc at Bingham, laid off 300 men awaiting better market conditions.

ZINC. The output of zinc was 21,286,871 lb. in 1917 and 18,399,417 lb. in 1918. Most of the zinc came from Salt Lake, Wasatch, and Beaver counties. There will be a general decrease in 1919, as the price is much lower and there is difficulty in marketing the product.

Dividends in the first part of 1919 were paid by the Utah Copper, Chief Consolidated, Tintic Standard, Utah Consolidated, Ontario, Eagle & Blue Bell, Judge, Iron Blossom, Daly, and Bingham Mines company.—V. C. Heikes, U. S. Geological Survey.

THE MINING legislation now pending before Congress includes a bill to authorize the exploration for and disposition of coal, phosphate, sodium, oil, oil-shale, and natural gas on the public domain.

Platinum in Colombia

Colombia produces an average of 30,000 troy ounces of platinum per year, practically all coming from the Quibdo district. The high prices prevailing during the War greatly stimulated the production, and entire districts along the coast and rivers west of Cartagena were depopulated, the people emigrating to the platinum district to wash for platinum gold. During the fiscal year 1917-18 production in weight of metal fell off on account of the protracted dry season, the usual heavy rains of the Quibdo region not materializing. A great many more people were engaged in the work, but the production per capita was not normal with relation to former years, when prices were much lower. Water for washing the metal had to be collected during the night in small pits dug in the banks. The work was thus made much harder and considerable time was lost. The fixing of the high price of \$105 per ounce for platinum by the U. S. Government during 1918 greatly stimulated the work, although the total production was not in relation to the greatly increased number of men engaged in the work.

The Condota River district is also a producer of platinum, but on account of the broken nature of the ground and heavy jungle no accurate estimate can be made of the possibilities of future production or of the extent of the platinum-bearing ground. Doubtless the fields are much smaller in extent than is generally supposed. In this region platinum predominates, there being approximately only 4% gold found with the platinum, while on the Quibdo side gold predominates, the platinum content of sands being only about 10%. Another part of the Quibdo district that produces platinum is the area near the headwaters of the Quito river, which is being worked now to a greater extent than ever before. Cartagena is the supply centre of the Quibdo region.

The labor engaging in this work is unsatisfactory. After working in the river a few weeks and making good pay, they will return down the river for the remainder of the season. Although as many as 300,000 men come into the platinum country during a single year, not more than 3000 men are working there at one time. The climate is very unhealthy. Several large companies have failed in attempts to use large modern dredges in this platinum and gold-placer district.

Mining property may be acquired by denouncement, as it is termed locally. A mining claim consists of an area of 240 by 1800 metres for quartz and vein mines, and 1000 by 5000 metres for placer claims. A quartz claim covers 106.75 acres and a placer claim covers 1235.5 acres. Assessment work does not have to be done, but an annual contribution or tax is paid on all claims held. This tax averages about \$20 per claim for ground rent, and does not include the various taxes, such as those on production and export. Americans wishing to acquire mining land by denouncement in Colombia are obliged to have the location made for them by trusted Colombians and transfer made to them later, since the law does not

prohibit native citizens from transferring mining property of foreigners if the permission of the Government is secured previously. During the period from 1910 to 1914 there were 3821 mining claims, chiefly gold mines, located in Colombia, and the Government granted 1018 titles to mines in all parts of the country. There are records of 18,386 mines in the country, but their exploitation is on a scale very inferior to their merits as mineral deposits.

In his annual report for 1918, the Minister of Public Works states that, although the total export of precious metals from the country reaches nearly \$6,000,000 annually, the net product for the National Treasury is only \$18,000, and it is recommended that mining contributions and taxes be increased and new legislation carried through to correct this condition. A presidential decree of July 9, 1918, prohibits the adjudication of placer or alluvial mines in the beds of navigable streams. A special permit from the Minister of Public Works is necessary in order to obtain permission to work placer ground in the bed of a navigable stream. An examination by government engineers has to be made in each case. In all legislation appertaining to mining there seems a decided tendency toward Government control.

The Choco district is also said to contain many other minerals, such as copper, lead, silver, and palladium, but little is known of the real extent or value of the veins or deposits. Many rich samples of all of these ores have been brought in by the native prospectors out for gold and platinum.

Foreign companies wishing to prospect for placer mining in Colombia should be prepared to furnish a large expedition, well equipped and having men experienced in the tropics. Medical service should also be provided as a necessary requisite to the success of the work. Such properties can only be developed successfully by large capital and the cost of operation and equipment is great. The general opinion among practical and experienced mining engineers who know the country and conditions, is that only the most valuable ground can be worked at a profit under present circumstances.

The United States took almost the entire platinum output of Colombia during the War. The following table shows the quantities imported from that country during 1915, 1916, and 1917. Statistics for 1918 show only the value of the platinum exported to the United States from Cartagena:

| Fiscal year. | Ounces. | Value. |
|--------------|---------|------------|
| 1915 | 13,601 | \$ 470,938 |
| 1916 | 25,588 | 1,473,553 |
| 1917 | 21,278 | 1,536,422 |
| 1918 | | 1,325,481 |

THE output of platinum, palladium, and other metals of the platinum group in Alaska in 1918 is estimated at 284 fine ounces, valued at \$36,600, according to the U. S. Geological Survey. From some districts the recovery was larger and from some smaller than last year. Some palladium and platinum was recovered from the copper ore of the Salt Chuck mine, near Ketchikan.

REVIEW OF MINING

FROM OUR OWN CORRESPONDENTS IN THE FIELD

ARIZONA

PRACTICAL MINING COURSE AT THE COPPER QUEEN.—
MAGMA COMPANY PURCHASES THE THREE R MINE.

DOUGLAS.—The transmission line between the Copper Queen smelter at Bisbee and the mines of the Phelps Dodge Corporation, Copper Queen branch, is nearing completion and it is hoped it will be ready for use by December 1. This line will supplement the central power plant of the Copper Queen at Bisbee in operation of mines and the new Sacramento mill. The Copper Queen smelter has been giving attention to fire prevention recently. A department of five companies, under direction of William Van Winkle, chief roundsman, has been organized and has a fire-drill every Saturday. Twice each month competitive drills are held, a box of cigars being furnished by the smelter management for the winning team. Alarm boxes have been made conspicuous by day by being mounted on red poles with white stripes, and at night a red lantern is attached to each box.

BISBEE.—Interesting meetings of the Copper Queen practical mining course are being held each Wednesday afternoon and evening at the Y. M. C. A. under the direction of S. O. Richardson. The class is making a thorough review of 42 papers read during the course, which covers all phases of mining operations. Following the review, examinations will be held for the benefit of all Copper Queen employees who attended 21 or more of the lectures. A new course is to be undertaken shortly after the first course has been completed, and further examinations will be held from time to time for those qualified to take them.

A new change-room for employees on Sacramento hill is under construction near the Holbrook shaft. A large part of the old Holbrook dump was excavated and removed in order to form a site for this building. All waste from the Holbrook now is being dumped into railroad cars and hauled to the regular Sacramento Hill dumps. When the new change-room has been completed the old Holbrook change-room, at present in use by men employed on Sacramento hill, will be torn down and the site used for a waste dump. Work on a new 'safety first' building near the Czar shaft is progressing rapidly, after delays due to non-arrival of material. This department of the company hitherto has been housed in a small concrete building on Sacramento hill. Not only is this not the safest location for such work, but expansion of the work under direction of William W. Gidley has

caused it to outgrow its present quarters. Several large transformers have been erected at the central power-plant of the Copper Queen preparatory to meeting increased power demands in this district as well as changes in distribution. The present plant is loaded to capacity but arrangements are being made for distribution of additional power from Douglas, where generators utilizing waste heat will be used to deliver power over the steel-tower transmission line. A sub-station is being built at the new mill to deliver power to this plant and to the pumps at the Calumet and Cochise shaft for supplying water to the mill. At one time the Copper Queen maintained separate power-plants for each of its shafts, necessitating a separate crew of engineers, oilers, etc., but as overhead was high and efficiency low under this method, utilization of central power-plants has become the practice. During the last two years operations have become so widely scattered and demands for power have increased to such a degree that entire re-arrangement of the system was necessary. In addition to the power supply from Douglas it will be necessary soon to erect a new plant at Bisbee.

PATAGONIA.—Negotiations for the sale of the Three R mine by the Magma Copper Co. have been concluded, the final papers having been signed by W. C. Browning, general manager of the Magma company. R. R. Richardson was the owner. The consideration is not announced, but is said to have been considerable, including a substantial payment at the time of the transfer and a series of deferred payments to allow the purchaser to develop the mine. The Patagonia-Superior Copper Co. has been incorporated by the Magma interests for the purpose of handling the Three R purchase. Mr. Browning, who is to be the general manager, expects soon to start active work. Extensive diamond-drill exploration is intended to be carried out over the entire property. Although the value of the Three R property is undoubted, its recent history has been one in which litigation figured largely. Prior to last spring the Three R was operated by the Three R Mining & Milling Co., of which H. C. and H. M. Harrison were the principal owners. A 200-ton mill was erected. The mine reverting to Mr. Richardson, Albert Steinfeld of Tucson and other creditors of the company asked that a receiver be appointed for the defunct Three R Mining & Milling Co. F. E. Fishburn was named to act in that capacity by the superior court at Tucson. Mr. Richardson, claiming that improvements at the mine reverted to him under contract, brought suit in the su-

perior court at Tucson to determine ownership. Mr. Browning has made a proposition to Mr. Fishburn, receiver, to purchase the surface improvements for \$20,000, the money to be placed in escrow subject to the outcome of the suit brought by Mr. Richardson. Hearing has been set by the court, the creditors being given an opportunity to object to consummation of the sale should they desire so to do. If the sale is approved by the court, as is anticipated, the new company would own all improvements and have a clear field for development. Prior to the time the Three R mine was bonded to the Harrison interests it was bonded to N. L. Amster of Boston, Massachusetts, for \$500,000. Mr. Amster worked it for a period, extracting and shipping considerable ore, but released it in 1914 at the conclusion of litigation between Mr. Richardson and Ben Heney, resulting in victory for the former. The property is situated in the Patagonia mountains, 9 miles south of Patagonia and consists of 55 claims. The principal workings are the Collosus tunnel, Evening Star tunnel, and Collosus shaft. The underground workings are about one and a half miles in extent. As the milling operations of the Harrison interests were not successful, it is reported that flotation or a combination of flotation and gravity concentration will be used.

PHOENIX.—George W. Long, of Phoenix, and S. R. Poss, of New York, have acquired the controlling interest in the stock held by S. J. Tribolet in the Kay mine in Yavapai county. The consideration is announced to have been \$500,000. The sale had been pending for several months. With the closing of the sale it was announced that the Kay Copper Co. had started development work on its property, situated in what is known as the Kay copper belt. A new 1000-ft. working shaft has been started and a complete modern plant of electrically equipped machinery is to be erected. During the last year development work at the Kay mine has opened a large body of ore and it is known that more than \$6,000,000 worth of ore has been blocked out. Diamond-drill operations have opened other bodies which will be explored later.

COLORADO

CRIPPLE CREEK AND LEADVILLE.

CRIPPLE CREEK.—A. E. Carlton, president of the Golden Cycle Mining & Reduction Co., has announced that if the coal situation requires the mill will be shut-down temporarily and the 2000 tons of coal now consumed monthly at the plant will be diverted to the mines of the district. Ores would in such cases be stored underground until the situation is relieved. The shut-down of the mill, the only plant handling district ores, would work a hardship on the small operators and lessees dependent on ore settlements to meet the payroll and mine expenditures.

Active operations have been commenced by the Isabella Leasing company, recently incorporated to operate a lease on the property of the Isabella Mines Co., Bull Hill. Operations, which are in charge of David Mason, started

from the 15th level of the Lee shaft at a depth of approximately 1275 ft., where a cross-cut is being driven south-west to cut under the Buena Vista ore-shoot that produced high-grade ore. The work planned will cut below this old stope 450 ft. October production made by four sets of lessees now operating on the Isabella estate approximated 500 tons of milling-grade ore. The Portland company has not yet started to drive to the vein on the 23rd level, and cannot do so until the situation is completed and a pump erected. The level is below the drainage tunnel and makes considerable water. Ore from the bottom level of the Trail mine, at a depth of 1500 ft., is reported to be averaging from \$32 to \$38 per ton.

Labor is still curtailing production and few properties are working with full shifts. Miners are returning, however, from the snowy districts of the State and the winter months are expected to show increase in the men available, if the coal strike does not tie up the gold-mining industry. The output of the district for October exceeded that of the preceding month by 2481 tons. The total shipment was 53,071 tons of an average grade of \$11.54 and gross bullion value of \$612,804. Ore was treated as follows: Golden Cycle mill, Colorado Springs, 25,000 tons, average grade \$20 per ton, gross value \$500,000; Portland G. M. Co.'s Independence mill, Victor, 27,321 tons, \$2.07 per ton, \$56,554; smelter at Pueblo, 750 tons, \$75 per ton, \$56,250. Total \$612,804. The following dividends were paid: Golden Cycle company, \$45,000; Portland company, \$60,000; Vindicator Consolidated, \$15,000; total \$120,000. The Golden Cycle will pay the regular monthly dividend of three cents per share, a total of \$45,000, on November 10.

LEADVILLE.—D. J. O'Neill and associates, operating the Continental Chief property under bond and lease, are extending the tunnel into Mt. Sherman in a search for the lost Continental Chief orebody, that in the early '80s produced ore of a value exceeding \$1,500,000. The tunnel is now in 1600 ft., and, as estimated by survey, is within one hundred feet of the point where the vein and ore should be found. Many narrow quartz streaks and seams have recently been cross-cut and these will later be prospected. H. Schraeder has leased the Griffin property on Mt. Kevin and the Colorado Power company has extended its power-line to the mine. Mr. Schraeder is already shipping a car a week of ore with silver content ranging from 20 to 70 oz. per ton, and with machine-drills in operation will materially increase production. Schraeder has sub-leased the lower tunnel to Lucian Smith, who will also soon commence production. The coal situation in the Leadville district is serious, and with a prolonged strike all mines except those electrically equipped must soon close down. The Colorado Power company has its winter's supply on hand, or close to the tonnage required, but will have difficulty in meeting the many demands for power. At present it looks as if the strike would be short-lived, so that it is improbable that the district will have to face the serious situation that would result from the shut-down of many of the mines.

MICHIGAN

MINERS RETURNING TO WORK.—NEW COMMUNITY PARK AT CALUMET.

HOUGHTON.—Calumet & Hecla had 50 miners return from Detroit and 20 return from Flint last week, resuming underground contract work. They had been gone four months, working in automobile factories. They have no complaint to make regarding the work they are leaving, but frankly were homesick for the mine. They received higher wages in Detroit and Flint, but wanted their comfortable homes. They were all family men.

12½-TON SKIP, NO. 1 SHAFT, RAY CON. COPPER CO.,
RAY, ARIZONA

The company is working 80 drills in the shaft pillars and arches on the old Calumet conglomerate lode. Over half a million tons of high-grade ore has been taken from these pillars in the old mine. The conglomerate continues to average 14 ft. in mineral width. Osceola Consolidated has 200 men working at the old Osceola mine.

October boat shipments of copper from ports of the Michigan district were 14,406,000 lb., compared with 5,916,000 lb. in September and 9,618,000 lb. in October 1918.

The Federal Bureau of Mines has designated the Mich-

igan College of Mines as headquarters for the district engineer and his staff and equipment for the entire Lake Superior mining district, which includes Michigan, Wisconsin, and Minnesota. Bryon O. Pickard, the district engineer, actually has made the college his headquarters for the past two years and the rescue car and the force of experts were assigned to the college to assist in instructing the soldier-miners, but Ironwood continued, nominally, to be headquarters until now.

La Salle Copper Co., a subsidiary of the Calumet & Hecla, is now employing but 20 men and is producing 1000 tons per month from development. The possibilities for the future depend upon the openings to the extreme north, near the boundary of the old Osceola branch of the Osceola Consolidated, where some good ground is in sight.

Seneca has concluded the purchase of the Gratiot, a Calumet & Hecla subsidiary, and will commence operations on the most southerly of the two Gratiot shafts immediately. The Gratiot carries the Kearsarge lode. It was opened ten years ago by the Calumet & Hecla, one shaft going down 1500 ft. and the other 1300 ft. The copper ore which was mined averaged 11 lb. in the mill-test. Seneca shaft continues sinking.

The Quincy Mining Co., which has operated its property on the hill outside the city of Hancock since 1848, has announced that its Community Center building, fully equipped with reading rooms, baths, gymnasium, auditorium, etc., for the use of its employees and their families, hereafter will be open to the people irrespective of whether they are company employees or not. This means that the Quincy mine club-house will be a public institution, a change that shows a rare concern for the good-will of the people generally. The Calumet & Hecla corporation has completed plans for an elaborate community park in Calumet, thus continuing its traditional policy of caring for the welfare of its employees. Calumet has everything in the way of community service that could be thought of, from the largest ice-skating rink in the world to the best band in the State. Now the company's big municipal park is to be situated in the vacant land that separates the village of Red Jacket from the mine location, a considerable acreage that has been kept clear of houses as a matter of fire protection. The Copper Range company operating the Champion, Trimountain, and Baltic mines, on the south range, now is figuring on a large community centre home to serve the people of all their mines and the village of South Range, contiguous to Trimountain.

NEVADA

FINANCING OF THE GOLDFIELD DEVELOPMENT CO.—LABOR AGREEMENT AT TONOPAH AND DIVIDE.

GOLDFIELD.—In a statement issued by A. I. D'Arcy, vice-president and general manager of the Development company, it is announced that as a result of his recent visit to New York the company "has arranged the necessary financing which will permit the carrying out of the full program as outlined". A meeting of stockholders is

to be called to increase the capitalization from 2,500,000 to 4,000,000 shares and the promoters of the company claim they have sufficient proxies to assure this. The report states that \$27,000 has been spent in repairing the mill and that \$205,000 more will be necessary to enlarge it to 2000 tons daily capacity and change the method of treatment to simple cyanidation. Mr. D'Arcy says 2,300,000 shares of stock has been issued and that the cost of mine development and mill repair has been \$100,000. In speaking of future operations, the statement says: "On a basis of \$5.50 ore, a \$4 cost would leave a profit of \$1.50 per ton, or a net profit of \$2,225,000 on a minimum tonnage of 1,500,000." The total cost for mining and milling is estimated at a minimum of \$3.15 per ton, the items in the estimate comparing as follows with the \$5.17 figure of the Consolidated:

| | Goldfield Consolidated | Goldfield Development |
|-------------------------------|---------------------------|--------------------------|
| Mining | \$2.72 | \$0.71 |
| Transportation | 0.06 | 0.10 |
| Milling | 1.53 | 1.61 |
| Concentrate treatment | 0.34 | ... |
| Marketing bullion | 0.03 | 0.03 |
| Marketing by-products | 0.01 | ... |
| General expense | 0.34 | 0.25 |
| Bullion tax | 0.03 | 0.03 |
| Moving dumps | 0.01 | ... |
| Moving tailing-dumps | 0.01 | ... |
| Property tax | 0.03 | 0.03 |
| Filter royalty | 0.04 | 0.04 |
| Flotation royalty | 0.02 | ... |
| Royalty to Consolidated | ... | 0.35 |
| Total cost | \$5.17 | \$3.15 |

In closing his statement, Mr. D'Arcy says: "While I cannot make a positive assertion that the lease will be renewed for another period of five years, at the time the Goldfield Development Co. obtained the lease it was given the verbal assurance of the Consolidated management that the lease would be renewed if the Development company carried out its program in a vigorous way."

Assays from controls put a value of \$120, \$66, and \$41 per ton respectively on the 22nd, 23rd, and 24th cars shipped by the Florence Divide lease on the Florence. The main stope, started from the 400-ft. level of the Red Hill shaft, is now 62 ft. high and 50 ft. long. The vein has an average width of from 18 to 20 ft. and the main production is being made from the hanging-wall side, where the value is practically all in gold as distinct from the foot-wall, where the ore assays high in copper. The ore-shoot has been opened for a length of 120 ft. and the lease superintendent states that the limit has not been found in any direction. Except for a 45-ton carload worth \$26 per ton, shipped from the Dolcic lease in the old Wheeler block, no ore has been produced by other lessees for a long period. Ore assaying \$9 to \$30 has been opened for a distance of 120 ft. on the dip of the vein in the Cracker Jack, which is regarded as the most important development in Goldfield in recent years because of the situation of the Cracker Jack outside the proved zone. The ore is in the Columbia mountain fault,

the hanging wall of the vein being andesite and the foot-wall rhyolite.

SIMON DISTRICT.—The Norman Silver, in which P. A. Simon, president of the Simon Silver-Lead Co., recently bought a controlling interest, has been consolidated with the Fagan, adjoining on the north-east, and a new company, the Fagan Consolidated Silver Mines Co., has been formed to develop both groups of claims. Simon is president of the Fagan Consolidated. The Norman and Fagan groups, a total of 12 claims, are $1\frac{1}{2}$ miles south-east of the Simon Silver-Lead. A large amount of prospecting has been done in the Fagan, principally through a 45-ft. shaft in which high-grade ore is exposed. The main shaft of the Norman is 85 ft. deep. The cross-cut from the shaft on the 300-ft. level has been driven nearly 100 ft. beyond the rhyolite intrusion formerly supposed to be the hanging wall of the vein, and the face is still in sulphide ore of good grade. The extension of this cross-cut has exposed orebodies on each side of the rhyolite for a total width of nearly 150 ft., with good ore extending into the rhyolite.

ROUND MOUNTAIN.—The Gibraltar, a promising silver-gold prospect in Jett canyon, Smoky valley, has been financed by Eastern interests and it is reported that development work on a large scale is to be undertaken. Assays of from \$25 to \$160 have been obtained for a distance of 300 ft. on the vein outcrop, it is said. Harry Stimler, discoverer of Goldfield, took an option on the Gibraltar last summer.

WEST DIVIDE.—Work in the north drift from the bottom of the 60-ft. shaft of the West Divide has been discontinued. The face assayed \$75 when work was stopped. The south drift has been driven 25 ft., and 18 in. of ore assaying from \$65 to \$95 is exposed across the bottom. This will be continued 125 ft. to cut under a point where good assays have been obtained on the surface. An old tunnel south of the shaft is being repaired and will be continued to cut the vein at a depth of 150 ft. Attempts are being made to finance two other companies owning claims in the district.

TONOPAH.—The Tonopah and Divide miners have accepted a proposition of the operators providing for an immediate increase in wages of 50c. per day and a commissary to handle meats, groceries, wood, coal, and miners' clothing. This agreement is to remain in force until a Federal mediator decides that the commissary has resulted in a reduction in the cost of living amounting to 50c. per day. The mediator is to return at the end of 60 days to decide on this, and will continue to return thereafter every 30 days until he decides the 50-cent daily saving is being accomplished. The bonus will then be withdrawn. The operators believe that by next August there will be a general lowering of wages in all industries throughout the country and they do not anticipate further trouble when the cut is made. The 50-cent wage increase is retroactive to the time the men returned to work.

The agreement came after weeks of effort in which the operators' meetings were controlled by the Tonopah Min-

ing, Belmont, and Tonopah Extension companies of Tonopah, with 800 votes against 600 of the Divide operators, based on the number of men employed in July. The crisis was passed when the Tonopah operators were brought into line by a threat of the Divide owners to withdraw and form a separate association. This followed a meeting that was adjourned without debate after a wage increase had been voted down. Although labor conditions have improved considerably there still is a serious shortage of skilled miners in both districts.

BISHOP.—The Tungsten Mines Co., operating 8 miles west of Bishop, suspended operations on September 20. It is expected work will be resumed in the spring. To May 1 the company employed from 90 to 100 men, but on that date, a contract at \$30 per unit expiring, the

from Jacksonville a distance of 35 miles to the Blue Ledge mine, California, and from there on to the coast at Crescent City. During the War this region was a heavy shipper of high-grade copper ore to the Puget Sound smelters. During that time the smelters found these ores essential in fluxing with the Alaskan ores from the north, and the result is that they are now in the market for all the available ores from this region.

This has been an impetus for the Blue Ledge mine to continue operations since the War under the high cost of mining. The mine is operated with 40 miners and has a weekly output of three cars of ore. It is under lease to the Mexican S. & R. Co., of New York. Jerome A. Hilbert is engineer in charge at Copper, California. Only ore running 12% or more is shipped, while the lower

Photo by Tune, Goldfield

SURFACE PLANT OF THE FLORENCE MINE, GOLDFIELD, NEVADA

force was cut to 55. From the date of the expiration of the contract to September 20 two hundred and thirty-eight tons of concentrate was produced and stored. The concentrator, said to be largest in the world treating tungsten ore, has a capacity of 500 tons daily. The deposits are low-grade.

OREGON

POSSIBLE EXTENSION OF THE MEDFORD-JACKSONVILLE RAILWAY.—GEOLOGY OF THE BLUE LEDGE MINE.

GOLD HILL.—The purchase of the Medford-Jacksonville railway by the Gagnon Lumber Co., of Medford, Oregon, is a matter of importance to the development of the copper deposits in the Blue Ledge district in the southern part of this county and northern California. The lumber company has a large holding of saw-mills and box-factories in Medford and Jacksonville, and this road already extends into the timber of the Applegate district supplying these plants. The new owners have already taken steps to organize a company to extend the railway

grades are being dumped to await future reduction at the mine or a lower shipping rate to the smelters. The present wagon haul to the shipping-point at Jacksonville from the mine costs \$11 per ton, which is done by wagons the first six miles from the mine and thence by 5-ton capacity auto-trucks.

The ore of the Blue Ledge mine consists of nearly solid pyrite and chalcopyrite with a little pyrrhotite and sphalerite or galena. The deposit is opened by a series of adits on the face of a cliff at different elevations; with the winzes and raises this gives a vertical exposure of ore for about 800 ft., and a horizontal exposure for about 2000 ft. The elevation of the mine is 4000 ft. The first fissures were cemented by coarse vein quartz; after shearing the second fissures were filled with calcite, chlorite, and sulphides. The veins average 2 ft. in thickness, and are narrower and lower grade in the lower levels. The veins strike nearly due north and dip about 65 degrees west; they are parallel with the banding of the schist country-rock, but locally cut across it. There are three

veins which are roughly lenticular in form; one lens succeeds another along the strike, usually with a small offset. The hanging wall is a soft white schist near the vein, but elsewhere it is a mineralized quartzite containing some muscovite. The foot-wall is a bluish-black hornblende schist. The position of the bedding and rock cleavage seems to indicate that the mine is on the east side of an anticline (overturned to the east) which pitches to the south. Faults are common in the workings but usually the offset is only 1 to 5 ft., so that there is no difficulty in following the veins. Pyrite in big cubes occurs in the wall rocks, especially in the hanging walls.

UTAH

LITIGATION BETWEEN UTAH-APEX AND UTAH CONSOLIDATED.
—SHORTAGE OF CARS IN THE EUREKA DISTRICT.

SALT LAKE CITY.—Contrary to expectations, there was no strike of the coal miners of the State on November 1. On the afternoon of October 31, John McLennan, international representative of the United Mine Workers, who had been in Carbon county directing the organization of miners, made the statement that there would be no 'official' strike of the unionized miners. Nevertheless, Government and State officials took measures to prevent any possible disturbances or damage to property at the coal mines. A detachment of 100 soldiers of the Twenty-first infantry at Fort Douglas, Utah, was sent to Helper, in the heart of the coal district, on October 31, and five officers and 110 men of the Thirty-second infantry at Camp Kearney, California, were also sent to Helper. All the mines were short of men on November 1, but this was due largely to that day being a religious festival—All Saints' Day—which was a holiday with the Italian and Austrian miners. On November 2 announcement was made that coal from Utah mines would be held at convenient points along the various railroads of the State by officials of the roads, acting under orders from the United States Railroad Administration. It is expected that the output this year from Utah coal mines will be about 5,000,000 tons.

Trial of apex litigation involving hundreds of thousands of dollars, between the Utah-Apex Mining Co. and the Utah Consolidated Mining Co., operating properties in Bingham, began November 3 in the United States District Court before Judge Tillman D. Johnson. Nearly a year's time has been used in preparation of the suits, of which six have been filed between the two companies. The present suit, it is expected, will continue about three weeks. The litigation is based on apex rights to large orebodies which have been, and are being, mined by the two companies in the Highland Boy and Yampa veins of the West Mountain mining district. The litigants are among the largest of the Bingham operators and for years have been extracting large tonnages of silver, lead, and copper ores. The Utah Consolidated has been one of the leading copper and lead producers in the State, and has a dividend record of over \$14,000,000. The property was opened up a number of years ago by Samuel Newhouse, originally as a gold and silver mine. It later developed

into a large copper producer, and at the time R. H. Channing, now president and managing director, was put in charge of the work, he was able to produce copper at 6c. per pound, a cost lower than any other mine in the State has obtained, and at the time the record for the United States. The property later changed hands, going to Standard Oil interests for \$6,400,000. Since then it has more than paid this back in dividends. The company ships its ore by tramway over the Oquirrh range to the International Smelter at Pine Canyon, above Tooele. At present it is producing about 125 tons of ore per day. The Utah Apex is the largest lead mine in the State. Development work during the past summer has been highly gratifying, and there is more ore developed today than ever before. The mine is capable of marketing 1000 tons of silver-lead ore per day, but owing to shortage of labor is producing about 300 tons. It is estimated that the cost of the suit will be \$500,000, about equally divided between the two companies, according to intimation given by attorneys on both sides.

ALTA.—The unwatering of the Emma Silver mine has been entirely successful. The bottom of the winze at the 300-ft. level is now accessible. Development work is being actively pushed.

After a tie-up of two weeks on account of heavy snowstorms, the Cardiff Mining Co. resumed shipments on October 31. Ezra Thompson, the manager, states that conditions at the mine are encouraging and that recently a large body of ore was opened on the 800-ft. level, averaging \$50 per ton in silver and lead.

Satisfactory progress is being made at the Howell mine, according to T. L. Walden, general manager. Operations in the main drift, which is being driven to tap the old workings, are proceeding steadily. The new electrical equipment erected during the summer is working smoothly, and sufficient supplies necessary to carry on operations during the winter have been put in.

A shortage of cars and recent snowstorms are responsible for the decrease in number of carloads of ore shipped during the week ending October 31. Of the 102 cars shipped, Dragon Consolidated leads the list, with Chief Consolidated a close second. Shipments from the Tintic Standard dropped to 4 cars, owing to inability to secure additional empties.

The E. J. Longyear Co. has taken over the East Tintic drilling operations of the Chief Consolidated Co. and will keep the machines running throughout the winter months, the work being under the supervision of R. D. Longyear.

On account of the increased activity among the mining properties of the East Tintic mining district, it has become necessary for the Utah Power & Light Co. to provide a 'tie-line' between the Tintic Standard and Copper Leaf mines. Work will be completed about December 1, and thereafter all mines in that vicinity will have ample power.

The Goshen Valley railway, a spur line from the Denver & Rio Grande railroad at Pearl, Utah, to the Tintic Standard and Iron King mines, has been completed and put in operation as far as Flora. The completion of the

road to Flora will facilitate the shipping of ores from the East Tintic district. Ores from the Tintic Standard heretofore have been hauled five miles by truck, whereas the distance to Flora is one and a half miles. The road will be completed to the Tintic Standard mine about January 1.

Plans for the consolidation of three large mining properties in the East Tintic district are being completed, according to F. C. Richmond of Salt Lake City. The mines involved are the South Lily, the Montana, and the Bonanza. This consolidation will give the newly organized company a total of 600 acres, adjoining the Tintic Standard, in what is considered a promising field. Surface indications and geological conditions have convinced those interested that the extension of the Tintic Standard vein will be found in the company's property. A shaft 550 ft. deep has been sunk. When operations are resumed by the new company, this shaft, at present a two-compartment—a manway and a working way—will be made a three-compartment shaft. The timbering will be renewed and equipment installed to sink to a depth of 1400 or 1500 ft. before cross-cutting to the objective, the Tintic Standard vein.

PARK CITY.—From nine to ten feet is being made per day in the driving of the Spiro tunnel in the Silver King Consolidated mine. The formation, a gray lime, is softening; work is being done without interference from water, and the strata, which were lying at an angle of 15° from the horizontal, are straightening up and are standing at present at an angle of 30°. Shipments from the new deposit recently struck in the Electric Light claim are proceeding as rapidly as cars for shipment can be secured.

Shipment of ore for the week ending October 31 amounted to 1447 tons. Of this tonnage, Silver King Coalition shipped 527; Ontario Silver, 395; Judge M. & S., 195; Daly West, 385; Daly Mining, 54; and Nail-driver and Silver King Consolidated each 55 tons.

The Ophir Silver Mines Co. has filed articles of incorporation with the Secretary of State. The company owns the Economy group of 15 claims in Tooele county, and is said to have a well defined vein, which has been prospected to some extent, several samples returning high assays. It is understood that the company will equip the property with suitable machinery for an extensive development campaign, which is expected to begin early in the new year.

DUGWAY.—Organization of the Buckhorn Silver Mining Co., to operate the Buckhorn mine, was accomplished recently. This mine is situated fifty miles west of Faust station on the Salt Lake route, the nearest rail point. From its discovery on March 11, 1891, to July 1 of that year, \$83,000 was received from ore shipments, when the ore-shoot was lost and the property abandoned. The ore shipped was principally a chloride containing much horn-silver and free gold, and assayed at the smelter from \$200 to \$1100 per ton in shipment lots. That the ore-shoot can be picked up again is considered reasonably certain.

WISCONSIN

REVIEW OF OCTOBER OPERATIONS IN ZINC-LEAD DISTRICTS.

Standard commercial zinc ore opened the first week in October, on offerings of \$43.50 per ton, base 60% zinc assays, with second-grades at \$42.50. Top grades were advanced the second week to a base given out for publication at \$46 to \$47 per ton, second-grades unquoted. The upward movement in price was continued in the third week, offerings going to \$48.50 per ton, base, with fancy or top-grade blende well in advance of \$50 per ton. The last week of the month gave evidence of higher price levels, offerings being advanced to \$51. With the last advance came an unmistakable demand for all grades of zinc ore, in which even the low-grade producers shared liberally, although the price on this was a little in advance of 60c. per unit of zinc in the ore. Following closely upon these better prices came increased exploration and development, two score or more drilling squads being at work at various points in the field. New mine development was undertaken, principally in the southern districts. Several new operating concerns started, with initial shipments of both zinc ore and lead ore, and some new power, mining, and milling plants were planned.

Similar gains occurred in the lead-ore market. Breaks on offerings were sharp and marked, the base, at the beginning of the month held in advance of \$70 per ton, giving way to offerings of \$85 per ton before the close of the month. Sellers were little disposed to come into the clear and part with their holdings, and shipments were therefore comparatively light, but in the aggregate the turn-in for the month was heavier than for any one month so far this year. Production showed considerable gain, due mainly to extensive deposits of lead ore recently uncovered at new producing mines. The reserve in the field was left untouched and at some points output of both zinc ore and lead ore exceeded bin capacity and the milled ore was dumped on the ground.

Shipments of pyrite from refining plants in the field were comparatively light all month. A gain in the total net deliveries was shown however by the introduction of heavy deliveries made from the Mineral Point Zinc Co. to Grasselli Chemical Co. of residue obtained in the ordinary course of zinc-ore separation.

Deliveries of zinc ore, lead ore, and pyrite, from mills to local refineries, and some ore from mines of good grade to smelters direct, were made for October as follows:

| Districts | Zinc, lb. | Lead, lb. | Pyrite, lb. |
|---------------------|--------------|--------------|----------------|
| Benton | 13,704,000 | 478,000 | 2,396,000 |
| Galena | 5,968,000 | 348,000 | |
| Livingston | 5,076,000 | | |
| Hazel Green | 2,216,000 | 1,120,000 | |
| Cuba City | 1,924,000 | 472,000 | 1,036,000 |
| Highland | 1,800,000 | 80,000 | |
| Shullsburg | 274,000 | | |
| Platteville | 88,000 | | |
| Linden | | 38,000 | |
| Mineral Point | | | 5,000,000 |
| Total | 31,050,000 | 2,536,000 | 8,432,000 |

Deliveries of the high-grade blende from reduction plants in the field to smelters, were as follows:

| | Lb. |
|-----------------------------------|------------|
| Mineral Point Zinc Co..... | 6,014,000 |
| Wisconsin Zinc Co..... | 5,764,000 |
| National Ore Separating Co..... | 3,470,000 |
| Linden Zinc Concentrating Co..... | 862,000 |
| Block-House Mining Co..... | 88,000 |
| Total | 16,198,000 |

The gross recovery at mills for the month aggregated 15,029 short tons; net deliveries from both refining plants and from mines to smelters direct, 10,821 tons.

Of the raw ore recovered distribution was made locally to the Mineral Point Zinc Co. 6606 tons; Wisconsin Zinc Co. 2821 tons; National Zinc Ore separators 3383 tons; Linden Zinc Co. 930 tons; on high-grade from mines and refiners to Grasselli Chemical Co. 4369 tons; American Zinc Co. 1457 tons; United Smelters 853 tons; American Metal Co. 235 tons; Mineral Point Zinc Co. 3007 tons. About 900 tons high-grade ore was held in bin at the close of the month and all other grades, about 5500 tons.

BRITISH COLUMBIA

TROUBLE IN THE COAL INDUSTRY NOT EXPECTED.—TRAIL SMELTER TO TREAT ZINC CONCENTRATES.

The present prospects are that the bituminous mines of British Columbia will not be affected by the strike in the United States. All the collieries of Vancouver island, as well as those of the mainland, are working as usual and there are no reports of impending trouble. The same applies, to date, to the mines of the province of Alberta. It was reported that the State of Washington would look to British Columbia to replenish its empty coal bins, the assertion being made that 10,000 additional tons would be shipped to the Sound every month in order to assist in overcoming any shortage that might develop. This caused some uneasiness in this Province, it being felt that it might result in industrial and domestic embarrassment at home. J. M. Savage, manager for the Canadian Collieries (D) Ltd., has stated that his company would make no greater shipments to the United States than usual for the simple reason that it was not in a position to do so. He said that the local demands were so heavy that the company was fully occupied taking care of them. Certainly the local market would have to be cared for before export was considered. Much the same statement was made by W. A. Webb, of the Canadian Western Fuel Co., which operates the Nanaimo Collieries, who added that the State of Washington could not look for more coal than now was being sent out because it was outside the capacity of the company to make such deliveries. Consequently those who were inclined to dispute a policy of permitting export of coal at the present moment apparently have been silenced. The bunkering of steamships sailing from Puget Sound ports will not be affected. Most of these vessels call at Nanaimo for their fuel. The Nippon Yusen Kaisha and Osaka Shosen Kaisha vessels

will be able to obtain coal from Sound bunkers which are filled from Vancouver Island mines.

SLOCAN.—An important discovery is reported on the property of the Rambler-Cariboo Mining Co. The new body of ore was found in the 900-ft. drift on the Jennie ground, the Jennie and Last Chance claims having been acquired by the company last summer. The Rambler is one of the largest operators as well as one of the oldest producers of the district, its output for the past 25 years having reached probably \$2,000,000 of which \$550,000 was paid out in dividends. Developed on a comprehensive scale, with a 1400-ft. shaft and a big cross-cut through which all the ore was brought out for years, the Rambler has been one of the best examples of drift development in the Kootenay. Active stoping now is proceeding on the 1000, 1200, and 1300-ft. levels, from which 30 tons of ore on the average is produced for the concentrator, which occupies an exceptionally favorable location on the middle fork of Carpenter creek. The mine and mill are connected by 1500 ft. of aerial tram.

TRAIL.—In order to keep its electrolytic zinc plant at Trail in operation during the inactivity of the Sullivan Mines at Kimberley, the latter being shut-down through a strike of the miners for an all round increase in wages of \$1 per day, the Consolidated Mining & Smelting Co. has arranged to treat the accumulated zinc concentrates of various Slocan district properties. The Rambler-Cariboo has 500 tons of concentrate, the shipment of which has commenced. The Standard, at Silverton, also has begun shipment of zinc concentrate, of which it is said to have some 300 tons. The Echo, at Silverton, is expected to contribute about 350 tons. A large quantity of zinc concentrate has been accumulated by the Rosebery-Surprise Mining Co. but it has not accepted the smelting company's terms up to the present. The settlement price is 2c. per lb. for the zinc, 75% of the zinc content being paid for when the concentrates run 50% zinc and 1½% being deducted for every unit the material is under 50%. The settlement for silver is the New York price on the day of sampling, 50% of the silver content being paid for, this rising to 60% if the silver content is 30 oz. or over per ton.

STEWART.—The statement that the Guggenheims had purchased a 51% interest in the Premier mine for \$5,000,000 was wired to Stewart from New York, where Messrs. Wood and Trites, two of the principal owners, were known to be, and was accepted in good faith and reported accordingly. It is now learned that only a two-fifths interest has been purchased. The owners refuse to divulge the consideration, but it is common rumor that the price paid was on a basis of \$5,000,000 for the mine, or \$2,000,000 for the two-fifths interest. The following are the officers of the new company: R. W. N. Wood, Fernie, B. C., president; H. A. Guess, representing the Guggenheim interests, first vice-president; Minor Keith, New York, second vice-president; R. W. N. Wood and W. R. Wilson, Fernie; R. K. Neill, Spokane; and H. B. Price, W. C. Potter, and H. A. Guess, New York, directors. R. K. Neill is manager; W. E. Norris, secretary;

and L. A. Chaplin, treasurer. During the coming winter, the company will use several specially designed tractors for drawing the ore from the mine to tide-water.

ONTARIO

GENERAL NEWS OF THE PROVINCE.

COBALT.—Silver production from the mines of Cobalt is averaging about 35,000 oz. daily. Every producing mine is working at normal capacity, and ample men are available. The system of appointing individual committees composed of employees at each mine is being carried out successfully. This was the basis on which the men

by the Hollinger Mines that the company has succeeded in reducing the cost of living 15% during the past 67 days. Company employees are sold commodities at cost. Some hope is entertained that the mechanical shovelers now being tried in the leading mines may in a measure at least overcome the present shortage of unskilled labor, such as shovelers. The Dome Mines is treating a little over three tons of ore daily for each man on its payroll. Compared with this, the Hollinger and the McIntyre are treating between one and a half and two tons per man, the smaller stopes not allowing the ore to be broken to such advantage.

KIRKLAND LAKE.—The Tough-Oakes has announced

A BLAST OF 25 TONS OF 40% POWDER, MOTHER LODE MINE, GREENWOOD, B. C.

returned to work following the labor strike which ended September 7.

The Coniagas ended its fiscal year on October 31, having produced over three-quarters of a million ounces of silver during the period. The annual statement will not be prepared for from one to two months, but it is learned officially that ore-reserves are such as to assure from two to three years' production, based on current quotations for silver and the present rate of output. High-grade ore has been encountered on the Silver Cliff mine. That part of the property lying between surface and a depth of 500 ft. is under lease to the Northern Customs Co. The ore-shoot is said to be limited in extent. The Temiskaming Mining Co. is reported to be negotiating for the purchase of the Buffalo mine. The officials of the Buffalo decline to make a statement regarding the report. The Trethewey-Cobalt Co. will hold a meeting November 7 for the purpose of considering the advisability of acquiring two more silver prospects in the Gowganda district. The question of taking over the remaining 49% of the stock in the Castle company is also being considered.

PORCUPINE.—An official announcement has been made

that it will not resume operations until next March. The reason given is that the difficulty of securing men and the cost of heating, together with the scarcity of coal, makes it advisable from an economic standpoint to not attempt a resumption of work at this time.

The other mines that were producing before the strike are all in operation again.

The three large producing mines, the Lake Shore, Teck-Hughes, and Kirkland Lake, have now all the men they require. The Kirkland Lake mill is running to capacity treating about 150 tons of ore daily. A vein of rich ore 15 ft. wide is being developed on the 600-ft. level. The shaft will be put down from the 600 to the 700-ft. level.

BOSTON CREEK.—The Miller Independence will construct a first-class road from Boston Creek station to the mine, which will enable the company to haul in heavy milling equipment this winter. The new central shaft is now down 255 ft. A station will be cut at 400 ft. and the shaft continued to the 500-ft. level. At the Boston-McCrea 18 men are at work with a small steam-plant. The surface outcrops have been sampled and test-pits sunk, and the results having been satisfactory a shaft is being sunk and is now down 40 feet.

QUEBEC

HARRICANA RIVER.—The British Minerals Corporation will undertake an exploration campaign on the Sullivan and Siscoe properties in this district, near the Ontario boundary. The Sullivan claims are situated on the shore of Lake De Montigny and the first discovery of gold in the district was made on this location in 1911. Some ten mineralized veins occur on the Sullivan group. The Siscoe is situated on an island comprising about 360 acres, where gold occurs in veins and stringers containing considerable tourmaline and some disseminated pyrite.

SONORA

YAQUI RAIDS IN THE MOCTEZUMA DISTRICT.—ARBITRATION BOARD FOR SONORA.

AGUA PRIETA.—The presence of a large band of Yaqui Indians in the Moctezuma district during the last week in October and the early part of November disorganized mining conditions, particularly in the outlying properties. Hundreds of miners and their families sought safety in the large towns during the raid, while threats on the part of the Indians to enter Pilares and Nacozari kept the people keyed up to a high pitch and decreased efficiency. The Indians were disastrously defeated at Bacadehuichi by a Federal force under Lieut.-Col. Gilberto Limon, November 1, and on the following day again were defeated in a skirmish a few miles south of Bacadehuichi. They were reported to have lost a total of 11 killed, as well as all their horses and the loot they had gathered in their raid through the eastern part of the Ures district and the southern and eastern parts of the Sahuaripa district. General Juan Torres, military commander of the State, at the head of a force of six hundred men, went south from Agua Prieta November 3 to sweep the north-eastern part of the State clean of the Indians. General Torres said he had a total of 4500 men under his command and intended to push so vigorous a campaign that mining men would be able to work their properties, no matter in what part of Sonora they might be situated.

Ore shipments from Sonora during October exceeded in value those of a number of months, according to a report from the office of J. M. A. Tostado, collector of customs. El Tigre not only exceeded its recent record, but the record of the property as a whole by shipping 21 carloads of concentrates to the El Paso smelter. The total estimated value of ore exported at this port was \$2,230,000, Mexican gold. The total amount was 251 cars, or 11,175 tons. The shipping properties and amount sent out by each were: Nacozari 9890 tons; El Tigre 940 tons; Estrella 80 tons; Prieta and Coronel 40 tons; Promontorio 40 tons; Monte Cristo, La Escudra, and San Jose 45 tons; La Caridad 40 tons; San Pedro and San Pablo 50 tons; San Nicolas 50 tons.

PROMONTORIO.—This property, owned by the Phelps Dodge interests, again has entered the lists as a shipper, the ore being freighted through Moctezuma to Nacozari to Douglas for treatment. It is a high-grade copper ore. A few men have been put to work on the dumps sacking

ore for shipment. When this has been completed, a larger force will be added. News of re-opening the Promontorio was gladly received around Moctezuma, where freighters have been experiencing a lack of work, due to mining conditions in the south end of the district.

CANARIO.—James P. Harvey, president and managing director of this property, has returned from New York, where he recently attended a meeting of stockholders. It was decided at this meeting to increase the capitalization of the company from \$2,000,000 to \$20,000,000. This was done by re-incorporating the New York corporation under the laws of Delaware and increasing the value of the two million shares from \$1 each to \$10 par. The Canario has been developing its properties a few miles north-west of Nacozari for the last two years and has considerable bodies of low-grade copper ore blocked out. Some of the stockholders wished to push development faster and enter the producing field, but Mr. Harvey counselled against this move until sufficient ore had been blocked out to warrant the erection of a large concentration plant. His policy finally was adopted by the company. Most of the stockholders are eastern people, although there are a few in Arizona, among them being Col. B. A. Packard, president of the First National bank of Douglas, who is a director.

CANANEA.—A temporary shortage of desirable labor has been felt here recently as a result of the exodus to the Arizona farm districts of many laborers who ordinarily work in the mines, mills, or smelters. Drawn by promises of large wages and good conditions to the Salt River valley to pick the cotton crop, many of the steadiest men in this district went to Arizona about a month ago. However, as the cotton crop is almost cleaned up, some of these men are already returning. No change in mining conditions is visible in the district at present, the Cananea company working about the same number of men and showing no indication of further increasing its mine or smelter output. The Democrata smelter continues to operate at about half its normal capacity. A meeting of delegates from the various mining companies in northern Sonora was held here October 16 for the purpose of selecting representatives of the laborers and companies for the northern zone of Sonora on the board of conciliation and arbitration proposed by Governor Adolfo de la Huerta. Ezequiel L. Rivas was selected by the miners as their representative. The companies, represented by Charles L. Montague and George Young for the Four C., Ramon Estrada for the Democrata, C. Seville for the Catalina, and Carlos Martinez for El Tigre, conferred upon the appointment of a man but made no announcement. It is expected that the announcement of their selection will be made early in November. Governor de la Huerta proposes to have the board formed of one representative each for capital and labor in the northern, central, and southern districts of the State, the governor himself to name a seventh member. All disputes as to wages, working conditions, and other questions affecting relations between employers and employees in the State are to be brought before this board for arbitration.

SUSPENSION OF ASSESSMENT WORK

H. J. R. 241, suspending assessment work on all mining claims for 1919, was passed by the Senate on November 5 and has gone to the President for signature. This will be welcome news to the mining industry, as there seems to be no doubt that the President will approve the Act and relieve the confused conditions resulting from the passage of the Act of August 15. The effect of the new Act is to do away with the 5-claim limitation of previous legislation.

The text of H. J. R. 241 follows:

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the provision of section 2324 of the Revised Statutes of the United States, which requires on each mining claim located and until a patent has been issued therefor, not less than \$100 worth of labor to be performed, or improvements aggregating such amount to be made each year, be, and the same is hereby, suspended as to all mining claims in the United States, including Alaska, during the calendar year 1919;

Provided, That every claimant of any such mining claim in order to obtain the benefits of this resolution shall file or cause to be filed in the office where the location notice or certificate is recorded, on or before December 31, 1919, a notice of his desire to hold said mining claim under this resolution.

These notices will be available for distribution at the State Mining Bureau, San Francisco, as soon as the law becomes effective.

ARIZONA

The Yellowbird Mining Co. has been taken over by the Silverita Mining Co. This company's property was purchased from S. W. Purcell of Tucson and is situated in the Papago district in the Sierrita mountains. The company is shipping regularly, the average of the shipments exceeding \$250 per ton in copper and silver.

Five thousand dollars was paid by the Daily Arizona Consolidated Copper Co. to Pinal county to complete the construction of a road from the Daily camp to the Three C ranch.

A new big discovery of ore has been made on the 100-ft. level of the El Tiro mine at Silverbell, which is under bond and lease to Percy Williams. The vein has been opened for 22 ft. in width assaying, it is said, 8% in copper. The ore is carbonate. Eight cars of 7% copper ore are being shipped each week.

CALIFORNIA

Forest.—Boston capitalists have acquired the Kate Hardy from Will M. Beggs and associates of San Jose. New work has begun under direction of E. C. Montgomery and additional equipment ordered. The tunnel is to be driven further on the orebody and the shaft sent 400 ft. deeper to open the vein in depth.

Forest Hill.—The new cross-cut tunnel at the Georgia Hill gravel mine is in 200 ft. and is expected to intersect the buried channel within 1300 ft. The tunnel is advancing 10 ft. daily with two shifts. Additional equipment has been ordered. The property is three miles from the Baltimore

property and is under management of Anthony Crafton.

Sierra City.—Marion Westall, P. R. Loeffler, and J. E. Westall have erected an 18-ton Gibson mill at their Martini mine, together with a 5-hp. gasoline engine. Surface buildings have been built and arrangements made for steady winter operations.

Tailorsville.—Feather River Copper Co. has ordered complete equipment for Snowstorm copper group, adjoining properties of Engels Copper Co. Arrangements have been made for delivery of electric power, and new main tunnel is in 250 ft. The company is composed of Arizona copper men, headed by George W. Long, of Phoenix.

West Point.—An 8-ft. lode of low-grade ore accompanied by a 13-in. shoot sampling \$120 in gold has been uncovered in the River mine, near the Mokelumne river. R. V. Montgomery, the manager, is planning to mill 2000 tons of \$7 to \$8 ore stored on the dump.

IDAHO

Coeur d'Alene.—There has been a different spirit in the Coeur d'Alene region since the conclusion of the strike, according to James F. McCarthy, president of the Hecla Mining Co., Wallace. The people are feeling better, and the supply of labor is larger than when the strike occurred. The Hecla mill is being operated on a basis of a shift a day. A second shift will be employed in another week and the third shift in two weeks. Operations will soon be resumed in a few days on the 2000-ft. level.

Kellogg.—The Bunker Hill & Sullivan Mining & Concentrating Co. has plans for an expansion of its smelting business and will enter the market with the intention of obtaining more custom ore, according to an official admission. The company has secured the services of Frank M. Smith, a metallurgist, who has been appointed assistant director of the smelting department. It will also establish an office at Spokane to facilitate the conduct of its business in several departments.

NEVADA

Carson City.—A. R. Argersinger, president of Nevada Protective Co., announces orders have been placed for a 30-hp. electric hoist, and that sinking of a 400-ft. vertical shaft will start about December 15. Foundations for the 75-hp. compressor are in place. Arrangements have been made to furnish air for two drills on the tunnel of the adjoining Comstock Superior group.

Discovery of an 8-ft. vein of \$16 ore is reported by the Southwest Comstock Extension Co. The ore was found near surface at the portal of a tunnel being driven to intersect the Roberts vein at a depth of 75 ft. From this point a 100-ft. shaft will be sunk on the orebody.

Goldfield.—The main orebody has been opened to a depth of 140 ft. below the 330-ft. level of the Crackerjack shaft and continues 10 ft. wide. H. G. McMahon, the manager, reports assays range from \$17.50 to over \$19 per ton. Arrangements are being made to increase the working force preliminary to sinking the winze deeper and opening a new level.

Kimberly.—Sinking the Alpha shaft of the Consolidated Coppermines Co. has just been started. The present depth

is 1440 ft., and it is planned to extend it an additional 400 ft. at this time. Diamond-drilling from the 1300-ft. level is proceeding and will be continued until definite information is obtained as to the depth at which sulphides occur. The present hole, which is the third one drilled, passed through 48 ft. of oxidized ore that averaged 8.5% copper, with an average of 2% for an additional distance of 90 ft. Ore production has been resumed and will be continued on a limited scale. Shipments from the Alpha mine are at the rate of about 100 tons per day, and considerable ore is also going forward from the Liberty Pit, where the Nevada Consolidated is mining ore from Coppermines ground and concentrating it at the Steptoe works under the existing contract between the two companies. The company has been fortunate in securing the services of E. P. Mathewson as consulting engineer.

Mandalay.—A new mining district, called the Mandalay, has been organized in Humboldt and Pershing counties, chiefly in the former. The principal mines at work in the new district are the Mandalay group, the Haystack, Craven, and the Big Six, the last being operated under the direction of George Kislingbury of Los Angeles.

Red Hills.—Florence is prospecting the Florence vein in virgin territory south of the 550-ft. level and storing ore for shipment. Seams and bunches assaying \$40 to \$75 per ton are found with the lower-grade material and it is planned to ship to the Kennett smelter when this plant resumes. Fifteen men are employed.

Rochester.—The November production of the Nevada Packard Mines Co. was \$27,000, mostly silver. The bottom of the Kromer workings is in 80-ounce ore.

Yerington.—Mason Valley Mines Co. has arranged for treatment of 2500 tons of 8% copper ore from the Northern Light mine at the Thompson smelter. The property has been worked under lease and option several months, but it is understood it will be turned back to owners because of failure to develop a sufficient tonnage of ore. The Northern Light is 18 miles from Yerington.

WASHINGTON

Danville.—The Lafour Mountain Copper Co., with properties near Danville, is ordering a \$10,000 equipment for development and production. Ore will be taken from the Comstock shaft and from the Walla Walla claim. This company is practically free from debt with title to 100 acres covering six claims and four fractions.

Spokane.—Officers and directors for the Northwest Mining Association, with head offices at Spokane, have been elected as follows: Frank A. Ross, president; G. B. Dennis, retiring president; Frank C. Bailey, secretary; J. V. Richards, mining engineer; Edward Pohlman, broker and director of Spokane stock exchange; J. C. Haas, mining engineer, and O. Jeldness, mine manager. The association's financial condition is satisfactory.

BRITISH COLUMBIA

Ainsworth.—The Florence Silver Mining Co., operating near Ainsworth, has increased its milling operations to two shifts daily, according to F. R. Wolfe, its president.

Cambourne.—E. Bodine will take charge of the Beatrice mine at Cambourne, owned by the New Era Mines Co., and will develop the property and make shipments simultaneously. Operations will continue through the winter. Work will be done in No. 2 tunnel, the face of which is in ore.

Riondel.—An orebody discovered on the Kirby claim has been cross-cut for 17 ft. without disclosing the foot-wall. Part of the vein is reported to contain milling ore in which there is a five-inch streak carrying 100 oz. of silver per ton. The property was staked last spring. The promise of the ground has prompted its owner, W. T. Kirby of Winnipeg, to form a syndicate of four persons to finance development.

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

W. J. Loring has gone to Boston.

Frank R. Wicks is at Neihart, Montana.

Hallet R. Robbins is at Manchester, New Hampshire.

C. A. Banks has moved from London to Vancouver, B. C. S. S. Sorensen, manager for the Braden Copper Co., is in New York.

H. F. Strangways is with the Cerro de Pasco Copper Corporation in Peru.

Olaf P. Jenkins is now geologist to the Sinclair Consolidated Oil Corporation.

R. C. Gemmell is at Duluth. He will visit Chicago on his return to Salt Lake City.

R. H. Channing, president of the Utah Consolidated Mining Co., is at Salt Lake City.

R. F. Haffenreffer, Jr., of Boston, president of the Utah-Apex Mining Co., is at Salt Lake City.

J. E. White has opened an office in the Bothin building, Santa Barbara, as consulting engineer.

Arthur E. Wells, of the U. S. Bureau of Mines, now stationed at Salt Lake City, was here this week.

Carlos W. Van Law has joined the staff of the Sinclair Consolidated Oil Corporation, in New York, where he is now residing.

D. E. A. Charlton, managing editor of the 'Engineering & Mining Journal', of New York, is now stationed in San Francisco.

Raymond F. Bacon, director of the Mellon Institute of Industrial Research, at Pittsburgh, and E. R. Weidlein, associate director, are at Salt Lake City.

Z. Nanase and Tomizo Sasabe of the Mitsubishi Co., of Tokyo, have finished their visits to American mining districts and sailed for Japan last Saturday.

A. B. Parsons, metallurgical engineer on the staff of the Butte & Superior Mining Co. will become an associate editor of the 'Mining and Scientific Press' on December 1.

F. Yamada, mining engineer at the Ashio mine of the Furukawa Mining Co., Japan, has been visiting Western mining districts. He sailed for Yokohama on November 8.

Lindsay Duncan, formerly chief engineer to the Nevada Consolidated Copper Co., and Curtis Lindley, Jr., mining and construction engineer, have formed a partnership with headquarters in the Mills building, San Francisco.

Frank M. Smith, until recently manager of the East Helena smelter, has been appointed assistant-director for the Bunker Hill & Sullivan company, and will have his office at Spokane. He was in San Francisco this week.

Thomas S. Carnahan, who has been associated with the Utah Copper Co. in the capacity of mine engineer, has resigned to accept a position with the Katanga Copper Co. in the Belgian Congo, where he will have charge of all mining operations. He expects to sail for London in January.

Reuben E. Smith was drowned through the overturning of a boat on a river north of Vladivostok, early in October. It is suspected that this was not an accident. He was recognized as one of the most intelligent men engaged in prospecting in Siberia. His wife and two children are at Vladivostok.

THE METAL MARKET

METAL PRICES

San Francisco, November 10

| | |
|--|-------------|
| Aluminum-dust, cents per pound..... | 65 |
| Antimony, cents per pound..... | 10.50 |

| Zinc-dust, cents per pound..... | 11.00—13.50 |

EASTERN METAL MARKET

(By wire from New York)

November 11.—Copper is inactive and lower. Lead is dull and steady. Zinc is quiet and firm.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

MONEY AND EXCHANGE

The question of foreign credits is again agitating bankers, and recently there has been more serious consideration of the subject. Several things have occurred to revive the urgency of extending foreign credits. With the defeat of various proposed amendments, indications point to ratification of the peace treaty before long. The Edge bill awaits only approval of the President. The recent World Cotton Conference at New Orleans and the Foreign Trade Convention at Atlantic City showed how vital was the necessity for financing Europe. And last, but not least, the large falling off in our export balance last month has brought home to bankers that something must be done, and done quickly, if we are to maintain anything approaching our past movement of export abroad.

There has been a widespread complaint in commercial centres over impracticability of the machinery so far proposed or created for facilitating shipments to Europe under conditions which require extension of long-term credits. There has already been one definite step taken—amendment to the War Finance Corporation act, which authorizes that corporation to make advances for this purpose to an aggregate amount of \$1,000,000,000. But it is significant that this provision has not been resorted to, and to all practical purposes it remains a dead letter. Shippers contend that they cannot do business with Europe in this way. Although they may be able to discount notes of their foreign buyers with the corporation, they are subject to a contingent liability until the debts are paid. What the merchants want is that the corporation should find the dollars, or cash, for the exporters and assume, itself, the responsibility of the foreign credit. In connection with the critical situation regarding our foreign trade, the following tabulation from the 'Boston News Bureau', giving exports and imports by groups for two periods in 1918 and 1919, is illuminating. (000 are omitted):

| | September— | September— | September— | September— |
|------------------------------------|------------|------------|-------------|-------------|
| | 1919 | 1918 | 1919 | 1918 |
| Imports: | | | | |
| Crude materials | \$201,840 | \$105,620 | \$1,153,398 | \$944,190 |

Eastern Metal Market

New York, November 5.

Dullness pervades all the markets. The unusual strike conditions are the cause of almost universal hesitancy of buyers.

Copper has declined in price on light demand and offerings by outside sellers.

The spot tin market is strong but the general market is inactive but firm.

Demand for lead has slackened but prices continue steady.

The zinc market has had a slight reaction from the low levels, from which it has recovered partly.

There has been no recorded change in the antimony market.

IRON AND STEEL

The coal strike has not yet had any appreciable effect on production of iron and steel because of large stocks of coal already accumulated. Non-union mines supply the Steel Corporation with its coking coal and independent companies obtain theirs from both union and non-union mines. Merchant blast-furnaces would likely feel the shortage of fuel sooner than such steel companies, but there is no immediate danger of a shut-down. A further return of strikers to steel plants is recorded each week and there is no indication that the coal strike will help the steel strike materially. October pig-iron output, according to 'The Iron Age', was 1,863,558 gross tons, or 60,115 tons per day, against 2,487,965 tons in September, or 82,932 tons per day, a falling off of almost 25%. Three weeks of September were free from the strike. In the last ten weeks improvement has been marked. For the month the net gain was 51 furnaces, 213 being in blast on November 1 against 162 on October 1. Some pig-iron makers have withdrawn quotations because of uncertainty as to fuel prices. Export sales of steel and pig-iron for October have probably equalled the best months of the year, but shipments were only one-fourth as much because of strikes in New York ports. Western railroads are negotiating for 150,000 tons of rails, but no contracts are expected until the disposition of the roads is settled. The Pennsylvania has also inquired for 200,000 tons under the same conditions.

COPPER

Partly because of a more aggressive attitude by producers in selling copper, and partly because of the strike situation in coal as well as in steel, the market has eased off and what inquiry there was has diminished. Buyers are less anxious to place orders and are inclined to await developments. As a result prices have declined so that today electrolytic can be bought as low as 21.25c., New York, for November delivery and perhaps December and it is possible that 21c. could be done. Lake copper is from 1c. to 1c. above electrolytic, which we quote at 21.25c., New York, as a fair average of the market. It is known that this has been done recently on a fair business.

TIN

A moderate business has been quietly done in the last week for all positions, including spot, ex-steamer at dock, metal in transit or unloaded and future shipment—so much so that on the surface there was little evidence of this buying and the market appeared quiet. While the demand which resulted in business was not brisk, buyers appeared to be more confident as the steel strike wanes. This condition may be upset by the coal strike, but feeling is optimistic rather than otherwise. The longshoremen's strike continues the dominating factor. The situation is better, however, several thousand strikers having returned to work and

this has been reflected in the price for spot Straits, which was 56c., New York, on Monday, yesterday being a holiday because of elections. Quotations for future shipment from the East are about 53c., with metal on steamers arrived or at dock at 53c. to 53.25c., New York. The tin statistics for October show 2875 tons arrived in the month, of which, 400 tons came in at Pacific ports. The quantity in stock, and landing was 7560 tons, which reveals the effect of the longshoremen's strike. Total imports to November 1919 has been 25,896 tons, against 51,603 tons to November 1, 1918.

LEAD

The market has been quiet but very steady. Quotations are unchanged both for the leading interest and for the independent sellers at 6.50c., St. Louis, or 6.75c., New York, for November delivery. If anything, the tone is a little heavy, which is taken to mean that the peak of the present movement has been possibly reached. The market seems to be at present on a day to day buying basis.

ZINC

Demand has been less active and quotations have receded. Prime Western for November delivery fell to 7.45c., St. Louis, last Friday, but has since advanced again until the present price is about 7.55c., St. Louis, or 7.90c., New York, 20 points lower than a week ago. British export and domestic buying is light, but a better export demand is looked for in the near future. Galvanizers are buying for nearby necessities. In the face of the present strike, both steel and coal, the market has been characterized as remarkably stable. In view of the present prices of the metals and commodities as related to pre-war prices, 8.50c. for zinc is deemed fair and probable when affairs become more normal. To what extent the coal strike will affect zinc production is not known.

ANTIMONY

Demand is light and conditions are unchanged with quotations at 8.75c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

Virgin, 98 to 99% pure, is nominal at 32c. to 33c., New York, for wholesale lots for early delivery.

ORES

Tungsten: The market continues to mark time, demand being very light because of both the steel and coal strikes and the tariff matter. One report is to the effect that high-grade Bolivian ore has sold as high as \$10 per unit, but the case is an isolated one. About \$1.25 per pound of contained tungsten seems to be the nominal quotation of ferro-tungsten.

Molybdenum: Quotations are nominal at 75c. per pound of MoS₂ in regular concentrates, in a market practically devoid of demand.

Manganese-Iron Alloys: Foreign demand for spiegeleisen continues to be the feature of this market. Inquiries and sales total around 5000 tons in the last week, which is over and above the 10,000 tons reported sold a week or two ago. Domestic demand is expressed in inquiries for almost 2000 tons, with about 1000 tons sold at the market quotation of about \$35, furnace. Demand for ferro-manganese is light. British producers have withdrawn temporarily from the market and carload lots of American alloy have sold at \$115, delivered, which is the market quotation for this year and first quarter.

Ferro-chrome: Sales have been made as low as 25c. per pound of contained chrome in 60 to 70% alloy, 6 to 8% carbon. There has been an increase in output, evidently caused by new producers.

Book Reviews

Induction Coils in Theory and Practice. By F. E. Austin. Pp. 61, ill., index. F. E. Austin, Hanover, N. H. For sale by 'Mining and Scientific Press'. Price, \$1.

This book is divided into 16 lessons, each of which considers some division of the subject. The explanation of the theory is illustrated by a number of practical examples. The book will be of value to both the student and the electrician.

Analysis of Babbitt. By James Brakes. Pp. 169. Allen Book & Printing Co., Troy, New York. For sale by 'Mining and Scientific Press'. Price, \$2.

This book describes the various methods for determining the chemical constituents of a given 'babbitt' mixture, and also gives some data on the manufacture of babbitt metal. About half the volume is devoted to a remarkably complete bibliography of the various subjects treated. The book will be useful to persons engaged in the manufacture or testing of babbitt metal.

Examples in Magnetism. By F. E. Austin. Pp. 86, ill., index. F. E. Austin, Hanover, N. H. For sale by 'Mining and Scientific Press'. Price, \$1.10.

While this book is primarily intended as a textbook for the student it will also be useful to the engineer. The introductory part of the book discusses weights and measures as applied to magnetic problems and also gives a brief review of trigonometry in so far as it concerns these same problems. The remainder of the book is devoted mainly to the statement and demonstration of the principal magnetic propositions illustrated by examples.

Iron and Steel. By Erik Oberg and Franklin D. Jones. Pp. 321, ill., index. The Industrial Press, New York. For sale by 'Mining and Scientific Press'. Price, \$2.50.

This is a 'popular' book on the iron and steel industry written in non-technical language. The first chapter is devoted to definitions and to notes on the history and to general aspects of the industry. Then follow chapters on iron ore, pig-iron, wrought-iron, steel in general, crucible steel, bessemer steel, open-hearth steel, electric steel, rolling-mill practice, alloy steels, high-speed steel, cast-iron, and steel castings. It will readily be seen that in a book attempting to cover such a large field, the treatment of any particular subject must necessarily be brief, but with these limitations in mind, the book may be said to give an excellent 'bird's-eye view' of the industry.

The Mineral Industry. Vol. XXVII, 1918. Edited by G. A. Roush; assistant editor, Allison Butts. Pp. 937 + xix. Index and many tables. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$10.

Volume XXVII of this annual review of the mining and smelting field is well up to its predecessors, although the end of the War is still too recent for full information to be available regarding the status of the industry in most foreign countries. Belgium is a notable exception, that sorely-tried country having published, within three months of the German evacuation, a full report of the production of the occupied territory for the period of the War, as well as the condition the various plants were left in by the retreating Germans. As the editors point out, this example might with great benefit to the industry be followed by some of the more favored of the belligerent nations; until such reports have been made, much of the material will necessarily need to be treated from the American standpoint.

The general scope of this annual résumé of the mining

field is too well known to the profession to require extended comment here; almost all that is needed is to call attention to its publication. The plan of the preceding volumes has been followed, each branch of the industry being discussed in an individual chapter, alphabetically arranged. As a work of reference it would seem to be indispensable to everyone engaged in the business of mining, except in the narrowest field.

Surface Water Supply of Hawaii, July 1, 1917 to June 30, 1918. Nathan C. Grover, Chief Hydraulic Engineer, C. T. Bailey, Acting District Engineer. Water Supply Paper 485, U. S. Geological Survey, 1919. Pp. 167, index.

Oil Shale in Western Montana, Southeastern Idaho, and Adjacent Parts of Wyoming and Utah. By D. Dale Condit. Bull. 711-B, U. S. Geological Survey, 1919. Pp. 26, map. From Contributions to Economic Geology, 1919. Part II.

Report of a Joint Committee Appointed from the Bureau of Mines and the United States Geological Survey by the Secretary of the Interior to Study the Gold Situation—October 30, 1918. Bull. 144, U. S. Bureau of Mines, 1919. Pp. 84, index.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

A NEW CUTLER-HAMMER BOOKLET

'C-H Drum Controllers' is the title of a new four-page two-color 8½ by 11 folder, which has been prepared by The Cutler-Hammer Mfg. Co., Milwaukee. It gives prominence to the outstanding features of C-H drum controllers, which have won for them an enviable position in the drum controller field. Three of the features are: accessibility, interchangeability of parts, and interchangeability of methods of

C-H Drum Controller, Showing the Construction

manipulation. Any C-H standard stock drum can be equipped with either rope, radial, or straight line drive and these are interchangeable. The folder plays up other points, such as the ease with which the contact fingers and the cylinders may be removed; the absence of wood in construction; the square metal shafts; and the straight non-stubbing fingers. Dimensions, rating, and other engineering data are given. Three types having common dimensions comprise five bulletin numbers, capable of controlling AC and DC motors from 1 to 100 hp. The folder has been prepared especially for the St. Louis convention of the Association of Iron and Steel Electrical Engineers, but is also being forwarded to those interested in drum controllers. The accompanying cut, showing the controller with the cover removed, indicates how the contact fingers may be removed after taking out a bolt at top and bottom. Electric haulage is coming to play such an important part in underground tramming that details of accessory equipment such as these C-H drum controllers are interesting and valuable to mining engineers.

WESTINGHOUSE TURBINES IN THE FAR EAST

Two 25,000-kw. steam-driven turbine units of Westinghouse make, which, when installed, will complete the largest steam-driven electrical installation in the Far East, are now being erected at Osaka, Japan, for the Osaka Electric Light Co. Situated in an extensive industrial district, this company furnishes light and power to street railways, steel works, ship builders, copper refining plants, paper mills, electro-chemical installations, and other industries. It is noteworthy that in 1908 the Osaka company installed three steam-turbine units of 3000 kw. each. In 1910 two more units of like capacity were added, and in 1911 two 5000-kw. units. The 25,000-kw. units now being installed will bring the capacity of this plant up to 100,000 hp. All of the above units are of Westinghouse manufacture.

COMMERCIAL PARAGRAPHS

The Jerry Johnson 100-ton cyanide mill at Cripple Creek is being dismantled by the Morse Bros. Machinery & Supply Co., of Denver. This mill, erected in 1914 and used but a few months, was completely equipped with Dorr thickeners, agitators, and classifiers, Oliver filter, etc. The material is being shipped to Denver for re-sale.

Lea-Courtenay Co. of Newark, New Jersey, has recently issued two new bulletins—one, termed H-4, on centrifugal pumps as well as a catalogue of its most complete line. The other bulletin, S-5, is a synopsis of typical centrifugal pumps installed in various industries, showing the wide range of pumping service which Lea-Courtenay centrifugal pumps cover. A copy of either of these bulletins may be had on application to the company.

Allis-Chalmers bulletin No. 1537 deals with details of Diesel-type oil engines, and is intended to be used when ordering repairs and spare parts. It contains 30 pages of diagrams and illustrations, each part being indicated and named so clearly that no mistake is possible. All that is necessary when ordering new parts is to give the name of the part wanted, as found in this bulletin, together with the size of the engine and the number of the cylinder.

Catalogue No. 17 of the National Compressed Air Machinery Co., Los Angeles, is just off the press. This is an attractively assembled booklet of 32 pages, and contains a wealth of detail that will be useful to anyone who is interested in obtaining small-capacity units, self-contained, for compressing air. The catalogue is well-illustrated with photographs of parts and assembled units, line drawings giving erection dimensions, and many tables containing valuable data on compressed air. Only stock models are illustrated, but the company invites correspondence on problems that could not be covered within the limits of the catalogue. When it is stated that the compressors described range in capacity from 1.6 ft. to 854 ft. of free air per minute at normal speeds, with considerable overload capacity, it will be realized that the variety of models is sufficient to cover any requirements.

TABLE OF CONTENTS

| | Page | | Page |
|---|------|---|------|
| EDITORIAL | | Low-grade deposits could be developed if the market value of a flask were stabilized at \$100. | |
| NOTES | 733 | CLASS JOURNALISM | |
| THE STEEL STRIKE | 734 | By P. B. McDonald..... | 740 |
| Report of the Senate committee. Settlement of labor quarrels by strikes. Compulsory investigation. Collective bargaining. Judge Gary's attitude. Revolutionary radicalism. Position of Mr. Gompers. Need for a more reasonable spirit. | | Unpleasant surroundings in which many editors of trade papers must work. | |
| CLAIMS AGAINST MEXICO | 735 | ARTICLES | |
| Circular from the Department of State in regard to claims of Americans against the Mexican government. Objections to the proposed regulations. | | MINING AND SMELTING NEAR MONTERREY, MEXICO | |
| MINING SPECULATION—II | 736 | By R. B. Brinsmade..... | 741 |
| British customs in mine reports. Misleading terms. Illusory 'costs'. Incomplete statement as to ore-reserves. Uniformity of output and the difficulties created thereby. Incorrect figures of 'profit' published by the Transvaal Chamber of Mines. | | Situation of Monterrey. The Diente Lead Mines. The A. S. & R. smelter. The plant of the Cia. Minera, Fundidora y Afinadora. The Monterrey steel works. | |
| DISCUSSION | | THE FUNDAMENTAL PRINCIPLES OF SAFEGUARDING | |
| THE DISCOVERY OF FROTH FLOTATION | | By Sydney J. Williams..... | 746 |
| By James Hebbard..... | 737 | Requirements for making a plant 100% safe. Guards and their application. The circular saw and difficulties of designing effective guards. The punch-press. Real safety engineering. | |
| A reply to an editorial in the issue of July 19. Statement concerning the discovery of the agitation-froth process in the Central mill, at Broken Hill. | | SHORT CUTS IN MINE SURVEYING—I | |
| FLOTATION IN STAGES | | By Douglas Waterman..... | 749 |
| By Blamey Stevens..... | 738 | The first of a series of articles pointing out how many practical problems may be solved. The transit and the level. Adjustments. | |
| An experience with the flotation of molybdenite. The mineral breaks into very thin flakes, one of which will occupy a primary bubble-surface. | | NOTES | |
| MINING ENGINEERS' FEES | | MINING IN MONTANA IN 1919 | 745 |
| By A. B. Frenzel..... | 738 | COMPARISON OF LABOR AND OTHER COSTS FOR FIVE YEARS | 748 |
| A decision, rendered in a Denver court, involving a definition of 'field-work'. | | DEPARTMENTS | |
| A TARIFF ON QUICKSILVER | | REVIEW OF MINING | 753 |
| By E. M. Gleim..... | 739 | THE MINING SUMMARY | 760 |
| An economic essential for the resources of a country to be developed. | | PERSONAL | 762 |
| By J. B. Hunley | 739 | THE METAL MARKET | 763 |
| An 'infant industry' that needs encouragement. | | EASTERN METAL MARKET | 764 |

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.
Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bldg.; New York, 3514 Woolworth Bldg.; London, 724 Salisbury House, E.C.
Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, \$4; Canada, \$5; other countries in postal union, 25s. or \$6.

G-E Centrifugal Compressors

FOUR motor-driven centrifugal blowers installed at the Inspiration Copper Company, Miami, Arizona.

These units have a capacity of 22,000 cu. ft. of free air per minute each against 5 lbs. pressure and are used in conjunction with flotation process.

General Electric
General Office
Company
Schenectady, N.Y.

IF you want to read a fair, incisive, and judicious analysis of the labor problem as it exists today, read the first five pages in the 'Outlook' of October 29.

APROPOS of an editorial paragraph in our last issue, we note with interest that Judge Mark R. Averill, of Tonopah, in passing upon a demurrer filed by representatives of the I. W. W. in Nevada, denied the right of free political criticism to aliens. The right of "saying orally what he pleases . . . extends only to citizens of the United States. It is not a privilege extended to unnaturalized persons", or, we infer, those who have failed to declare their intention of becoming citizens. The Court ruled further that whereas strikes are lawful, "that does not mean that strikes for political purposes or to subvert government are lawful". All of which seems to us to be sound doctrine and worthy of acceptance.

AMONG dividends paid by mining companies we note the 850% declared recently by the Premier (Transvaal) Diamond Mining Company, of South Africa, on its operations during the last fiscal year. Moreover, it is rumored that the twin of the celebrated Cullinan diamond has been found. The Cullinan, which was found in 1905 and weighed 3024 carats, or 1.7 pounds, before being cut, is supposed to have been "a cleavage fragment of a much larger octahedral stone", according to Dr. Wagner. It may be that this other half has been found. The Cullinan diamond was too large for ordinary use, so it was sold for a nominal price of \$500,000, in order that the South African government might present it to King Edward on his coronation.

SILVER has risen to the highest price within half a century, and it is not surprising, having regard to the world-wide demand for subsidiary coins. Paper money was created lavishly during the War, without a corresponding increase of the minor coins needed in daily business. It is reported, for example, that in the French provincial cities, as well as in Paris, it is becoming increasingly difficult to get change for a 5-franc or a 10-franc note. In a great city like Toulouse it was found necessary during the War to use metal tokens and pieces of cardboard as substitutes for centimes. Today conditions are no better, so that a purchaser cannot be supplied with goods in a store unless he is prepared to give the exact amount of his purchase, for no change is given. This scarcity of smaller coins exists despite the fact that

the French government during the last five years has issued more silver coinage than during the preceding 35 years. Part of the scarcity is due to a distrust of paper money among the peasantry, but it is due also to the depreciation of French paper money and the smuggling of French silver coins across the border into Switzerland, Italy, and Spain, where the 5-franc, 2-franc, and 1-franc pieces are melted down by speculators.

BY the death of Dr. Martin D. Foster, the War Minerals Relief Commission has lost one of its members, and a new one will have to be nominated by the Secretary of the Interior. Another appointment to be made is that of a successor to Mr. J. E. Spurr as Chief Engineer to the Commission. The Committee on Mines and Mining of the House of Representatives seems to favor a more liberal treatment of claims under the Act and may support remedial legislation to that effect. More than 350 cases have been disallowed under the Attorney-General's technical interpretation. It is stated also that deductions from claims for amounts made in payment of properties will further reduce the total of compensations under the Act by nearly a half.

WE regret to learn of another outrage perpetrated on a member of our profession in Mexico. On November 5, at San Javier, in Sonora, an attempt was made to murder Mr. George A. Kennedy, assistant superintendent of the mine owned by the W. C. Laughlin Company. A number of Mexican workmen attacked him from behind while he was discussing a fancied grievance presented by one of them. He was knocked down, beaten on the head, and shot through the thigh, the bone being shattered. Mr. Kennedy is a graduate from the Colorado School of Mines and had been at the mine a year. He is now at the Sisters' Hospital, at Nogales, Arizona. Four American employees have been killed at the San Javier mine, two during the current year, yet no one has been punished. The man that shot Mr. Kennedy is under arrest, but he is the hero of the town. We trust that the matter will receive attention from the State Department at Washington.

WORK has been resumed in the mines of the Tonopah district, the strike having come to an end definitely on November 8, after more than one abortive settlement. The strike was called on August 17, and on October 4 it was declared off by the craftsmen, that is, the skilled

workers, leaving the radical or I. W. W. element in the cold. This was followed by the organization of a local or domestic union, entirely unaffiliated with any national organization, and distinct from the local I. W. W. group. An injunction was issued by the District Court, on petition of the Governor, to prohibit meetings and demonstrations intended to prevent the miners from resuming work. So a fresh start was made, but on November 1 a demand for an increase of \$1 per day was made by the new union. This was under discussion when, with the approval of the Federal Mediator, Mr. A. E. Lord, the companies agreed to pay a bonus of 50 cents per shift and to establish a general commissary by means of which the miners could obtain all necessary supplies at cost, with the provision that when it had been established to the satisfaction of the Federal Mediator, there would be an automatic return to the former scale of wages. It was also agreed that, when this was done, the companies would not charge more than \$37.50 for board as against, say, \$45 at the present time. This was accepted by the men, and an agreement was signed making it binding on both sides to August 15, 1920.

ESTIMATION of the average cost of producing copper is recognized as difficult, on account of the varying proportion of the precious metals yielded by copper ores and of the other by-products of the industry. We note that the Federal Trade Commission has ventured to make an estimate of the cost of producing copper in 1918. The report of the Commission is based upon information from 85 companies, producing 95½% of the total output in the United States. The average cost is given as slightly more than 16 cents per pound, and it is stated that more than 85% of the production was made at a cost of less than 20 cents, indicating that the remaining 15% must have been produced at less than 7 cents per pound. The companies exploiting ore of the disseminated type, usually known as the 'porphyry' group, incurred a cost of less than 15 cents per pound; how much "less" the report does not say. These contributed 34% of the total output. The profits of the copper companies were "very high", says the report, under the Government schedule of 23½ cents established on September 21, 1917, and raised to 26 cents on July 2, 1918, during the War. The profit realized for the year averaged 28% on an investment of \$672,000,000.

FROM an experienced mining engineer just returned from the Salmon River district, in British Columbia, we learn that the Premier promises to be one of the big mines of the world. He speaks well of the district and says that there are three nearly parallel vein-formations, the first of a comparatively low-grade character, marked by the Big Missouri, Province, Payroll, Indian, and Lake & O'Leary prospects; the second a high-grade lode-channel marked by the Forty-Nine, Mineral Hill, Big Missouri, Northern Light, Cobalt, and Premier; and a third marked as yet by only one prospect of any importance, the Spider. These are generalizations, of course. The low-grade belt shows rich ore in places. The Big Missouri group ranks next to the Premier and includes

claims on two lines of vein-formation. The country-rock is mainly greenstone, which is traversed by dikes of granitic and dioritic character. The ore is a silver-lead mineral, containing lead as galena and silver as native, stephanite, and proustite. Zinc appears in some of the lodes, especially in the claims along the Bear river. The pyritic ore assays several ounces in gold, but the Premier bonanza is a silver-lead ore, the high-grade containing 300 ounces of silver per ton and 30% lead. Two mining towns have been established, namely, Stewart on the Canadian side and Hyder on the American; they are only 1½ miles apart and the Alaska-British Columbia boundary passes between them. Both are on navigable water and can be reached by steamer from Prince Rupert in 10 hours. From Vancouver the district can be reached in 36 hours, by boat. There are about 250 people there now, and it appears likely that a rush will ensue next spring.

FROM Johannesburg and from London, we hear that dealings in South African mining shares have been greatly increased of late, so much so that there is talk of a Kaffir 'boom'. One correspondent says that "enormous activity has developed on the Johannesburg stock-exchange". The London financial papers are printing articles on "the Kaffir revival" and are giving their readers information concerning sundry neglected stocks that appear to have "speculative merits". The reason for this cheerful condition is the free market for gold and the substantial premium that the South African product now commands in London. By the way, we note that the 'South African Mining Journal' imputes the activity of certain stocks, such as Consolidated Mines Selection, Anglo-Americans, Springs, and Brakpans, to American participation in share speculation, and says "it is understood that Anglo-Americans and kindred stocks are about to be introduced on Wall Street. This is regarded as a most decided bull point. America is today literally overflowing with wealth, and if American financiers take an interest in Main Reef stocks and shares, we shall certainly see enhanced prices for stocks and also tap another source of capital supply for the development of new areas". This is interesting, but we think that the British income-tax and excess-profit tax together will deter any American from buying the shares of companies registered in London.

The Steel Strike

Of various phases of labor turbulence at the present moment, we select the strike of the steel workers on account of the report issued by a committee of the Senate that was appointed to investigate the subject. This committee consisted of senators from Iowa, South Dakota, Colorado, Tennessee, and Massachusetts; it was representative of the country as a whole and of both political parties. Although given to the press on November 8, the report has elicited but little comment; yet it was interesting and important. We find much in it that is timely. For instance, the report declares that "there is no place in this country either for industrial despotism

or labor despotism", and then it proceeds to identify strikes with "industrial barbarism", meaning presumably that a strike is a barbarous method of settling an industrial disagreement. It is; and a better way must be devised for the sake not only of the disputants themselves but of the community that suffers from such a barbarous method of adjusting economic contests. The committee properly concludes that the public has a right to demand that neither capital nor labor shall arrogate to itself the privilege of determining industrial controversies as it pleases, and the duty is upon Congress to provide a way out of the difficulty. As strikes at present appear to afford the only means by which labor can secure "even its just demand", it is recommended that Congress authorize the establishment of some agency of mediation, such as the recent War Labor Board. Such an agency "would have the power of compulsory investigation, but not to the extent of compulsory arbitration". It would be effective, however, because "a just decision would be endorsed by the public". The committee finds that some of the laborers in the steel-mills had a just complaint as to hours of work, but not as to wages. Sympathy is expressed with the principle of collective bargaining, but the Committee does not believe that the steel strikers took the right course in selecting such a representative as Foster, and "Judge Gary could well have objected to receiving a man with such views". However, Judge Gary's refusal was not put on this ground, but on the fact that the leaders did not represent the employees, although himself conceding that 10 to 15% of the men in the mills were unionized. Therefore the Committee holds that "even this 10 or 15% had the right to select their own representatives and present their grievances, and that they should have been heard". With this we agree. Judge Gary himself is a lawyer whom the Steel Corporation engaged as its representative; he is not a metallurgist nor an engineer; he is the publicity man for the Corporation. Testimony given before the Committee sustained the contention that a large proportion of the strikers are non-English speaking aliens and indicated that behind the strike was massed "a considerable element" of revolutionary radicalism represented by such a man as Foster. He and Margolia are mentioned as "dangerous to the country" and also "to the cause of union labor". The Committee considers that the American Federation of Labor made "a serious mistake and has lost much favorable public opinion by permitting the leadership of this strike movement to pass into the hands of some who have heretofore entertained the most radical and dangerous doctrines", and it states further that the same Federation "should purge itself of such leadership, in order to sustain the confidence the country has had in it under the leadership of Mr. Gompers". Since then Mr. Gompers has charged the Government with "violating the principles of democracy" by using the injunction to terminate the coal strike. Evidently Judge Gary's uncompromising attitude before the Labor Conference has had the effect of throwing Mr. Gompers into the arms of the radical faction, which was trying to unhorse him and which he had been opposing steadily. It is a great pity that the

reactionary and the radical elements in this industrial quarrel should have been allowed to dominate the stage at this time when the more reasonable representatives both of the employers and the employees were showing signs of a conciliatory spirit, which is the only one that will solve the difficulties now facing American industry. We must have a reasonable spirit as between the two sides and a recognition on the part of both that they must conduct their disputes so as not to sacrifice the welfare of the community at large. The Government stepped between the coal operators and the coal miners in order to prevent injury and suffering to our whole population, and its action called forth such instant approval as to give a warning to the representatives of capital and labor alike that there is a limitation to their methods of warfare: in short, that we are not living in the jungle but in a state of civilization that calls upon every citizen to consider his obligations to the community and his duty to the nation.

Claims Against Mexico

In connection with the claims for damages brought by American citizens and companies against the Mexican government, a critical position has been created and calls for serious attention. In a circular issued by the Department of State, under the heading 'Application for the support of Claims against foreign Governments', the following occurs: "If any legal remedies for obtaining satisfaction for, or settlement of, the losses or injuries sustained are afforded by a foreign government before its judicial or administrative tribunals, boards, or officials, interested persons must ordinarily have recourse to and exhaust proceedings before such tribunals, boards, or officials as may be established or designated by the foreign government and open to claimants for the adjustment of their claims and disputes [and they must make affidavit that they have done so]. After such remedies have been exhausted, with the result of a denial of justice attributable to an official, branch, or agency of a foreign government, or have been found inapplicable or inadequate, or if no legal remedies are afforded, the Department of State will examine the claim with a view to ascertaining whether, in all the circumstances of the case and considering the international relations of the United States, the claim may properly be presented for settlement through diplomatic channels, by arbitration, or otherwise." This is unfair to those who have lost so much by the Mexican revolution, for the following reasons, each one of which could be elaborated. (1) The cost of bringing individual actions in each and every case is unnecessary and entails excessive cost. (2) What is there, in international law, to prevent the American government from employing an attorney to represent all American citizens? (3) The attorneys employed by individuals must be Mexicans or foreigners living under veiled threats of the Mexican government. (4) An agent of the American government, to examine these claims as presented and reserve them for discussion with the Mexican government when the proper time comes, would pre-

sent a solid front, make uniform demands, and place all claimants on an equal basis. (5) The Mexican government is forming a commission, but it is hard to find a Mexican law made in late years that has not been introduced either to facilitate personal graft or for the purposes of personal revenge. (6) The American is forced to stoop to bribery in order to be able to run his business at all. Why should he be forced to do so by his own government when there is a remedy? (7) A person or corporation owning property in Mexico is entirely at the mercy of the Mexican government. If he invites its enmity by making a large claim upon it directly at this time, or before all claims are presented simultaneously, he may have his business ruined by the Mexican government. (8) On the face of it, there seems no reason for settling claims on different bases and by diverse methods, some questionable; there should be uniform justice and simultaneous payment, none having any advantage and none suffering through partiality. (9) Although repeatedly asked, our State Department is unable to say what can and cannot be claimed. There are a great many degrees of 'consequential' damages. No lawyer in the United States or elsewhere knows which of these can apply. This may be a reason for the Government wishing to disclaim responsibility. We commend these suggestions, made to us by a well-informed mining engineer in Mexico, to those of our readers whom the matter concerns; and of such there must be many.

Mining Speculation—II

In the second and third articles mentioned in our last issue, the writer, Mr. J. A. L. Gallard, deals with sundry technical questions, drawing his information from recognized text-books. It is pleasant to note that a financial journalist has taken pains to make himself familiar with at least a portion of the literature of mining technique. In the next two articles, he discusses ore-reserves and the way in which they are computed. He refers to some of the vagaries of custom in language studiously moderate. As a matter of fact, British mining companies, or rather their managers and directors, do some very queer things, meriting outspoken criticism. For instance, the reports of mines on the Rand show 'payable' and 'unpayable' ore, and include under the latter heading millions of tons of conglomerate that has no chance whatever of being exploited at a profit. The tonnage multiplied by the assay suggests to the layman a profit that is entirely illusory, but serves its purpose in giving a fictitious foundation for the market over-valuation of the company's shares. Two million tons of rock containing 2 dwt. of gold per ton will be listed as "unpayable ore" in a mine where the cost of mining and milling is more than the equivalent of 4 dwt. per ton. Another common camouflage is to quote, in official reports, a 'cost' that is fallacious to the extent of being as much as 50% understated. Owing to the 'over-head' expenses of mines operated at a distance from the home office and owing to the failure to deduct depreciation and plant-renewal from the gross expenditure before stating the cost per ton of

ore, it is quite common to find the public mystified by figures of 'cost' that are utterly wrong, but which again serve to put the enterprise in a rosy light, enabling insiders to dispose of blocks of shares before the time of disillusionment arrives. The managers of the Indian gold mines give the tonnage of ore in reserve, but do not state its assay-value or the profit to be expected from it. The assumption is that the grade does not change from year to year, which, of course, is contrary to fact. No suggestion of a sinister purpose can be made in this case, for the managers, John Taylor & Sons, set a high standard of probity in their administration of these mines, but the practice is to be condemned unhesitatingly because if adopted by others less scrupulous it would afford plenty of chances for chicanery. British companies publish monthly or weekly reports of production, and, in one instance that we recall, even a daily statement of output. This helps to keep the mine in the public eye and promotes share-dealing, for every deviation from the normal prompts either gratification or uneasiness as the case may be. The effort, usually well intentioned, to maintain a uniform production ends only too often in a collapse, the condition of the stopes compelling the manager abruptly to decrease his output, in tonnage or grade, or both, whereupon there is a débâcle in the share quotation and sometimes a scandal, which, however, does more harm to the unfortunate manager than to the directors, who usually 'find an alibi' somewhere. Mr. Gallard, of course, says none of these things. Financial journalism in London, even of the higher type represented by him, is not so independent as to dare to be so indiscreet. Indeed the London mining market suffers from the lack of fearless criticism, not of the small-fry promoters, but of the controlling financial houses. The next two or three of Mr. Gallard's articles do not call for comment. They give elementary information in a useful way. In his seventh, he discusses 'Working Costs and Profits'. He refers to sundry anomalies and recognizes that "it is quite possible for a mine to show a 'working profit' and to be actually operating at a net loss from the shareholders' point of view". Debenture charges, the Transvaal profit-tax, and London expenses are items likely to be obscured. Even to this day the Transvaal Chamber of Mines issues a monthly and an annual statement of the 'yield', 'cost', and 'profit' per ton, from which the innocent shareholder deduces the amount of dividend that will be coming to him. The 'cost' is absurdly misleading, for it fails to include a number of necessary items, not extraordinary, but ordinary. Thus whereas the total profit in 1918 was given officially as £7,678,129, the dividends, which constitute the only real profit to the shareholder, amounted to only £5,144,077, or two-thirds the amount stated. The fictitious average profit per ton for the Rand as published officially was 6 shillings, whereas the real profit was only 4 shillings per ton. It is remarkable that the Institution of Mining and Metallurgy should have failed to exercise a wise influence in persuading the Transvaal Chamber of Mines to correct this discrepancy, which is repeated month after month, and year after year.

DISCUSSION

The Discovery of Froth Flotation

The Editor:

Sir—In your article on this subject in your issue of July 19, I note that you use remarks of mine in an attempt to prove that Minerals Separation Company were not the inventors of the frothing process, which process has earned such immense additional profits to its users, some of whom you appear to defend in their efforts to avoid payment for the brief time of its patent life, or in other words, support those who deliberately endeavor to evade payment for a process that they would never have been able to apply had it not been for Minerals Separation Company and its staff of experts diligent application in the early life of the discovery.

In order to discount these efforts without which you would have had nothing to write about in this direction, you imply that Shellshear, Beauchamp, and Hebbard were well acquainted with the operation long before the patent was taken out. As a matter of fact, if you read carefully my paper of November 10, 1913, you will find it stated that the observed flotation of certain particles up to a certain time was not of commercial value and that the extension of the existing magnetic plant was consequently proceeded with; to quote my remarks:

"In the meantime the first experiments in flotation, to be described later, had been carried out, but the results being less satisfactory than those obtained by the magnetic process, and the No. 1 plant continuing to do satisfactory work, the second or No. 2 magnetic plant was erected in 1904."

To further clear the various points raised, it may be of interest to know that Mr. Shellshear was not in my employment before May 23, 1904, and that Mr. Beauchamp, although employed in underground work previously, did not come into contact with flotation work until June 19, 1905.

You are no doubt aware that in the preparation of blende for assaying purposes it had been observed for years that the particles persistently floated in the beaker to the annoyance of the assayer and it was not until 1901 that Potter turned this action into a partially commercial success.

In fairness to me and those who collaborated with me, I trust you will again peruse my paper wherein the story of flotation as far as Broken Hill experience is concerned is fully set out and that Mr. Higgins therein mentioned reported early in 1905 the first clear indication that flotation as now perfected was arriving at commercial success.

His report as quoted by me shows that the reduction of oil resulted in flotation instead of granulation and thereupon "the Wilfley tables of the original plant were then dismantled to make room for the sand-boxes already mentioned, and the granulation process gave way to the flotation process with simple spitzboxes late in 1905".

Melbourne, October 7.

JAMES HEBBARD.

[We are glad to hear from Mr. Hebbard. Fortunately both Messrs. Beauchamp and Shellshear were in San Francisco when his letter arrived, so that we were able to make further inquiry. Mr. Beauchamp says that Mr. Hebbard's statement concerning the period of his employment at the Central mill is correct, he having confused this employment with his previous active participation in flotation work. He re-asserts that both he and Mr. Shellshear tried and advocated the method of frothing some time before it was recognized by those in authority. It was not until the Cattermole granulation process had proved a failure that serious attention was given to floating off the sulphides in the form of a froth by means of spitzkasten. The advantages of this system were apparent at once and the plant was changed accordingly. Mr. Hebbard has stated that the discovery of froth flotation was made simultaneously at Broken Hill and London, and that the reports announcing the discovery crossed in transit. Credit for the discovery was given to the London laboratory, but Messrs. Beauchamp, Shellshear, and others had good reason for believing that the knowledge of the process was first obtained at Broken Hill. That belief is not shaken by Mr. Hebbard's letter. In regard to Mr. Shellshear, that gentleman also confirms Mr. Hebbard's statement in regard to his employment at the Central mill of the Sulphide Corporation. Turning to Mr. Hebbard's last paragraph, we refer those interested in the controversy to Mr. Hebbard's paper, published in 'The Flotation Process' and in our issue of September 4, 1915. It will be found that he there states that in December 1904 (the so-called discovery in London was made in March 1905) a test yielded "all float concentrate, *no granular material being formed*" by the use of only 0.75% oleic acid on the mineral, equivalent to 7 to 9 pounds of oil per ton of ore. Does not this test, made in Australia three months before the marvelous discovery in London, show that a reduction in the proportion of oil caused flotation rather than granulation? The Wilfley tables of the original plant were dismantled because the spitz-box proved more efficient for the purpose. Mr. Hebbard hints that this change was due to the report by Mr.

Higgins. This is not in accord with the facts. No Cattermole granules were ever produced in the large-scale plant in the Central mill because there was never sufficient oil for this purpose. All the work in this large-scale plant in its early stages was based upon an effort to float the mineral and otherwise separate it on Wilfley tables; and as the oil was reduced, the recovery of mineral from these tables was also reduced. It was not until the spitz-box was introduced that the process was developed into a practicable large-scale method of froth flotation. The use of the spitz-box for this purpose was suggested by Messrs. Beauchamp and Shellshear, not by any member of the Minerals Separation staff. In his paper Mr. Hebbard refers repeatedly to "air-bally" material. This remained in close contact with the table in company with the sand but floated immediately under the influence of puffs of air. He refers all through his paper to this material as "granulated", doing so, apparently, in order to give the impression, which is erroneous, that the Cattermole process was still in use, whereas this "air-bally" material had no resemblance whatever to the Cattermole 'granules'. The reader is referred to Mr. Hebbard's paper. If he will read it carefully, he will, we think, corroborate our inference that the froth process was in experimental use in the Central mill long before the supposititious discovery made by Mr. Higgins, on the suggestion from Mr. Ballot, in London in March 1905.—EDITOR.]

Flotation in Stages

The Editor:

Sir—Referring to the article by W. H. Coghill under the above title, published in your issue of September 20, and the discussion of Mr. Ernest Gayford in the issue of October 18, a few observations of my own may be offered as of possible use.

The experience of the Lower California Metals Co. of Nogales in regard to the flotation of molybdenite was the same as that of Mr. Coghill. I was persuaded at the time, however, that this was to be attributed to the exceptional character of molybdenite, and should not be expected of most other minerals.

Even when not finely crushed, molybdenite breaks into very thin flakes; and when the ore is finely crushed, these are excessively thin. The molybdenite flake lies with its greatest extensions in the plane of a bubble-surface, and as apparently a primary bubble-surface can only accommodate one flake in thickness, it requires a large flotation capacity to get a reasonable extraction of molybdenite.

With other minerals I have seen bubbles in the last cells that had visible spaces between the grains of mineral. With molybdenite I never had enough flotation machines to see any such space. Probably it is not practicable to carry the concentration of molybdenite to such a degree of perfection because the final concentrate is required to be of exceptional purity, as compared with the concentrates of other minerals, and most of the flakes that are pure enough are collected in the first cells.

Cleaning the concentrate obtained from further cells seems to be rather a thankless job.

The amorphous molybdenite, such as the Duquesne mine produced, could hardly be made into a marketable product at all. It is natural to suppose that the smaller the particles of mineral the greater the difficulty of crushing them fine enough to free them from gangue. This is apart from the additional trouble of cleaning the concentrate, especially that containing carbonate of lime and other easily pulverized materials that permeate the solution and inevitably form a portion of the bubble.

This idea of the limit of the primary bubble-surface capacity to one thickness of mineral has not, I think, been brought prominently forward before and may reasonably be expected to be questioned. It has, however, a basis of theory. Water and most other solutions disintegrate fine granular material, like clays, and swell them out because the liquid forces itself between each two contiguous grains (capillary attraction). It so forces itself because the water-solid contact tends to extension as much as possible. There are Brownian movements, but these can hardly be thought to be primary causes of the absorption of water by the material.

The particle, being floated, must have a definite relation (whatever it may be) to the surface, or surfaces, of the bubble. Within the liquid, two particles do not stay in contact, but are forced apart. Therefore, each bubble-surface can only support one flake or one surface of a particle. Anything else that is in the bubble is merely caught up by accident.

When a bubble breaks, its load is deposited on the bubbles below it and in time a single bubble may accumulate many thicknesses of particles and so have great stability. But this is accidental and in no way related to the actual process of the selection of the particles by bubble-surfaces.

The extra thicknesses might just as well be of sand or any other earthy material that might be sprinkled over the bubbles.

The fact that the effect Mr. Coghill mentions has only been noticed with molybdenite, and this in at least two very distinct cases, seems to indicate that it is hardly worth while to worry about the stage-crushing of most minerals. One great practical advantage in favor of flotation, of course, is the small number and the simplicity of the grinding and classifying appliances employed. Any improvement by floating in stages would therefore have to be very apparent and clearly economical in order to be acceptable in practice.

BLAMEY STEVENS.

Mexico City, October 29.

Mining Engineers' Fees

The Editor:

Sir—A few days ago a case was decided in a Denver court (with mining men on the jury) in which the promoter, who had engaged an engineer to go from his place of business in Colorado to another State on important work, declined to pay the bill of the engineer engaged, on

the ground that 'field-work' was service at the place of examination and did not include time 'in transit' or spent in hotels. Professor Regis Chauvenet, past-president of the Colorado School of Mines, and Forbes Rickard, both eminent mining engineers, testified for the plaintiff that "field service" was generally understood to include time absent from and returning to the regular place of business of the engineer engaged, but did not include fractions of days of the start and finish of travel or consultations with other engineers engaged by the defendant promoter in reference to the original report. Verdict for plaintiff, with full amount sued for, and costs.

A. B. FRENZEL.

Denver, October 29.

A Tariff on Quicksilver

The Editor:

Sir—In your issue of October 18 there is a letter from Mr. Arthur B. Foote concerning tariff protection for metals. Mr. Foote takes the point of view of a gold miner, and it is to be hoped sincerely that his is not the point of view of the majority of gold miners, or other miners for that matter. If it is, we have the mining industry divided against itself.

If a reasonable tariff on quicksilver, chrome, and tungsten would so stimulate that part of the industry producing them that there would result a labor shortage in other parts, it would appear that the country must possess vast resources in these metals that, for some reason, are not being developed. When the resources of a country are not developing, the country is suffering an economic loss. There is no good reason why one branch of an industry should lie idle in order that another may have cheaper labor.

Everybody will not admit that a tariff always has the effect of raising prices. If properly applied, it will permit industries in this country that cannot compete with powerful industries of the same kind in foreign countries, to develop; and it is reasonable to believe that a fair percentage of them will reach a point where they can compete. Competition means reduced prices.

It seems to be regarded as an economic essential that a country should develop and have at its command all its resources. During the War the Government made frantic efforts and expended vast sums of money to force productivity, at a moment's notice, of latent resources which, in the case of metals and minerals, few outside the scientific bureaus at Washington knew existed.

The importance of having the quicksilver, chrome, and tungsten industries developed far outweighs any increased cost to other industries, using their products, caused by a tariff which will enable them to exist during the early stages of development. Common sense must be applied; it would be nonsense to protect an insignificant industry that could not possibly have a future. When, however, an industry depends on a natural resource, great care and some patience should be exercised. This country comprises a vast territory and we all believe that,

in most instances, its latent resources vastly exceed those developed, otherwise we would be a nation of pessimists rather than the nation of optimists that we are. There seems to be a general conclusion by men outside the quicksilver industry that our supplies of ore are all but exhausted and that the industry is a declining one, deserving no consideration. Such a conclusion is without reason and unwarranted by the facts. What the industry needs now is a chance to develop. European producers are not going to give consumers in this country their metal at a slight margin above cost, but will obtain the highest price they can and at the same time keep competition out of the field. What we need is not a tariff that will give us an unreasonable price but one that will stabilize the industry by removing wide fluctuations of price and enable us to do consistent and efficient development. Inconsistent development forced by periodic high prices or by the Government in time of need is the worst thing that can happen to a mine. It results in inefficient equipment and bad work, and, in most instances, in the gutting of the deposit long before its day of natural exhaustion.

In the quicksilver industry, artificially increasing its value or rather stabilizing it at a fair price will not result in decreasing the value of ore in any other mine. This might have been so in the case of silver ores in the days of pan amalgamation but it is not so in these days of cyanidation, and it is not so in the case of gold ores. The cost of quicksilver per ounce of gold, in gold amalgamation, is insignificant. The cost of explosives per ounce of gold or silver is also insignificant, to say nothing of the effect of a slight advance in the price of blasting-caps.

E. M. GLEIM.

Study Butte, Texas, October 25.

The Editor:

Sir—In response to the many articles relating to the question of a protective tariff on quicksilver and other metals of the infant industries, I would like to submit the following views, as one interested in the quicksilver industry.

The opinion seems to prevail, from various articles that I have read from time to time, that the quicksilver industry is a declining one. It is not even conceded that the known deposits could be developed without destroying all possibilities of a future in quicksilver. Many seem to think that California has all of the quicksilver deposits of the United States. Others will go so far as to state that a protective tariff on quicksilver would tend to inflate the already high prices; and that these inflated prices work a hardship on all of the industries that are required to use quicksilver or any substance containing quicksilver.

The quicksilver industry in this country cannot be a declining one, for as yet it has not had the honor of having arisen. It is commonly known as one of the infant industries, and as such is in need of development. There are considerable low-grade cinnabar deposits that could be developed if the market value of a flask (75 lb.) of

quicksilver stabilized at about \$100 by a protective tariff. The experience with these deposits shows that they for the most part become richer in depth. Considerable development work then becomes necessary to learn the nature of them and prove their value. This development work must take considerable time, and thus we cannot adopt the policy of watchful waiting while the supply and demand adjust themselves pending the starting of the development work.

Up to the present time California contributes more than half the quicksilver produced in the United States. Oregon and Nevada have some few deposits that may be developed while Texas, which produces about a quarter of our quicksilver, has considerable areas of mineralized country containing quicksilver deposits. This region is generally known as the Big Bend country and for the most part lies in Brewster county. All these deposits may be developed while even others may be discovered if the market price should be stabilized at a fair price.

It is quite true that all industries depend directly or indirectly upon each other for a livelihood. One industry in itself produces a certain article that several other industries require and it in turn requires the products of several of the other industries. Thus it may be seen that the decline of one industry affects the prosperity of all the others, as well as the prosperity of the country. Why then should foreign concerns—in this case, only one foreign concern, namely, the Rothschilds, who control about 74% of the quicksilver industry of the world and manipulate the market as they wish, cracking the whip at those who are trying to develop the industry in this country—be allowed to directly control our prosperity? They are able to produce as much or as little quicksilver as they like, and thus keep the price to where it best suits their needs. They unload their product in this country only when the value goes high enough over here to give them a profit over what they could obtain in Europe. It may thus be seen that it is the producers in this country that suffer the decline only to have the same condition repeated once the price rises again. How can anyone feel here that they are benefited by the establishing of free quicksilver? No one pays for it except our own industries and we might as well keep the money at home by placing a tariff on the quicksilver, stabilizing the market, and developing our own resources.

Study Butte, Texas, October 29. J. B. HUNLEY.

Class Journalism

The Editor:

Sir—Referring to your interesting editorials on the type of editors that most of our trade and professional papers have, a recent number of 'System: The Magazine of Business' printed some suggestions of advantages that European business has over American business.

'System' pointed out that the higher officials of a European business house are apt to have their offices in quiet nooks secluded from the hurly-burly of routine friction, or perhaps have no offices at all in the ordinary sense of that term, but do their work at home. This

permits more uninterrupted and careful thinking than would be possible otherwise.

The usual American trade paper sets its editor down in the middle of clerks, printers, visitors, parades, telephones, bickerings, and bluffings, and tells him to go ahead and produce thoughtful editorials and interesting articles. Naturally his efforts appear spasmodic and commonplace; his editorials read like a business letter, and his ideas lack historical perspective and judicial poise. Writing under such conditions is not much different from writing on the sidewalk of a busy street-corner. If a business-man needs quiet and leisure to collect his ideas and formulate plans, how much more does an editor need them!

As to the business-man's need of seclusion, 'System' says, speaking of the European system: "A close physical association destroys perspective . . . As one executive said to me, 'If I were near at hand, my managers would come to me with their first impressions, and I should be all day settling matters which they ought to settle themselves. They have a problem because they do not know exactly what they are talking about . . . The business of a chief executive is to think, to plan, on broad lines of policy, and one cannot have the necessary detached mind if he is being bothered with the petty affairs of the day. I make decisions, but will not bother with the machinery before or after the decision'."

As you indicate in your editorial, many of the shortcomings of our editors are the consequence of treating them like petty clerks, to be frowned at if they sit dreaming and chewing a pencil and to be hustled into "office efficiency".

P. B. McDONALD.

New York University, November 4.

THE metallurgical industries of Belgium, taken as a whole, are in very bad condition. Large plants like those at Thy-le-Chateau, Monceau-Saint-Fiacre, Bonnehill, and Thiebaut have been totally destroyed. Others, like the Providence, Clabecq, and the greater part of the large factories in the Liege valley, have suffered serious injury; the blast-furnaces have been wholly or partly demolished, the rolling-mills destroyed, and the steel works plundered. In regard to those which were destroyed, it is impossible, even approximately, to say when they can be reconstructed or placed in working order. An effort will be made to repair those only partly plundered and to restore to usefulness the parts still standing. These factories in general will be able to resume their former activity after undergoing repairs, which, however, will take several months. Only a small number of factories have suffered slightly or not at all. These may begin work within a few months. To bring about the rehabilitation of these important industries, it will be necessary to re-establish transportation facilities, replace, as far as possible, missing apparatus and machinery, and notify the owners as to when and under what conditions they will be indemnified for their outlay. The lead factory of the Dumont Brothers Co. at Sclaigneaux was almost entirely destroyed by the Germans.

FIG. 3. PLANT OF CIA. MINERA, FUNDIDORA Y AFINADORA

FIG. 2. SMELTER OF THE A. S. & R. CO.

Mining and Smelting Near Monterrey, Mexico

By R. B. BRINSMADE

INTRODUCTION. The city of Monterrey, capital of the State of Nuevo Leon, is situated at an altitude of 500 metres above sea-level and only 150 kilometres from the Rio Grande. Its low altitude gives it the climate of southern Texas rather than that of the Mexican plateau, which usually exceeds 1500 m. in elevation; and its propinquity to the border makes it the most American in appearance and population of all the large Mexican cities. Leaving the city with its well-paved streets, its handsome business blocks and residences, and its extensive smelting industry, we need go only 12 miles out of town on a narrow-gauge railway to reach the extensive lead mines of the Cia. Metalurgica Mexicana at the village of Diente.

DIENTE LEAD MINES. The railway terminal is at an elevation of 1000 m. in a valley with high, steep walls. As shown in Fig. 1, the valley represents an eroded anticline in shale, whereas the cliffs above are of hard blue limestone, which encloses the orebodies. The cliffs contain a line of vertical caves, and it was on the floor of these that the lead ore was first discovered. The largest ore-chimney yet found lay beneath the floor of the biggest cave, which was 150 m. in width and height. The crest of the cliffs is 1000 m. above the valley and the ore-chimneys evidently extend down for a long distance, as they show no signs of cutting out in the deepest workings. As is usual in this class of deposit, a series of seams and stringers runs along the ore-zone and guides the prospector from one chimney to another. The valuable mineral is silver-bearing cerussite, which changes to galena in the deeper workings, while the accessory minerals are limonite or pyrite, and calcite. The many faults and folds cause the ore-channel to cut across the beds of limestone and the mine excavations were formerly worked by square-set timbering, but this required imported Texas pine and cost five times as much as the

present system of slicing under mats of timber in panels,¹ which permits the use of native wood and is fully as convenient, because these sub-vertical chimneys of soft ore are descending within firm walls of limestone. The regular output from this group of mines is 1000 tons per month using a crew of 250 men; but when in bonanza, shipments of 5000 tons per month have been made.

There are three mines, the Zarugosa, the San Pablo,

FIG. 1

and the San Pedro. The lower stopes of the San Pablo are opened by an adit (see Fig. 1) that communicates with a vertical shaft. The loaded mine-cars, which come up on the single-deck shaft-cages, are run down by gravity on an 18-in. track through the adit to its mouth. The empty cars are hauled back to the shaft by an electric hoist of Lidgerwood make and second-motion type, using a half-inch steel rope. To descend from the portal of the

¹'Mining without Timber', by the Author, p. 206.

adit to the railway loading-bins in the valley—distant 1000 m. horizontally and 400 m. vertically—there is a three-rail gravity surface tramway of metre gauge working with a $\frac{3}{4}$ -in. steel rope.

Starting from an adit at a higher level is a wire-rope tramway, on the Hallidie single-rope system, which is now little used. A third ore-conveyor is in the form of a Bleichert wire-rope tramway, which has an inch carrier-rope of locked coil and a $\frac{3}{4}$ -in. traction-rope to cover a horizontal space of 2200 m. and a vertical height of 600 m. This last tram takes the ore from adits nearly 200 m. vertically above the main adit, which is served by the aforesaid surface tramway. To a person unused to this locality, the steep limestone cliffs, rising dizzily above the tramway terminals, and the sheer drops of the rope-ways themselves appear more suitable for a birdman than for a conventional miner.

Power for the mining machinery is furnished by two Fraser & Chalmers return-tubular coal-fired boilers, 5 ft. diam. by 18 ft. long, with 52 four-inch tubes. These supply steam to a Fraser & Chalmers horizontal compound Corliss engine with 24-in. stroke and low-pressure cylinder of 24-in. diam. This engine turns two Bullock dynamos, which furnish direct current at 500 volts for running the electric motors in the mines above. The steam-power plant is on the level of the railway to Monterrey and close to the foot of the Bleichert tramway. Near the mine-office in the village of Diente, on the west edge of the valley, is the air-compressor plant, run by electricity and sending its output through a 6-in. welded pipe to the adit and into the mines.

Drilling for development and stoping is done mostly by air-hammer drills. The repair-shops are placed on the level of the adit and are run by electric motors. In 1910 the mines were flooded by four days of steady rain, and this caved many of the winzes. Since then it has been necessary to use artificial ventilation in the deeper stopes in the form of electric fans. Normally, the vertical bedding-planes of the limestone drain off the scanty rainfall so that no pumping is needed to keep the workings dry.

SMELTER No. 3 OF THE A. S. & R. Co. Returning to Monterrey we may now visit the lead smelter, No. 3, of the American Smelting & Refining Co. This plant (Fig. 2) has a nominal capacity of 460,000 tons annually; it is on a site of 300 acres and has 10 blast-furnaces. These are all 12 ft. long by 44 in. at the tuyeres, of which there are eight of $3\frac{1}{2}$ -in. diam. on each side. There are four flanged-steel water-jackets on each side and one at each end, while the smelting charge is enclosed by a rectangular brick tubé extending to the feed-floor and resting on the usual I-beam girders and cast-iron posts.

The lead is ladled from an Arents siphon-tap but the slag has to pass two settlers before reaching the Nasmyth slag-car, which is hauled by a light steam-locomotive to the slag-dump. The first settler is a brick-lined rectangular steel tank and needs changing several times each year; the second settler takes the overflow slag from the first and consists of a specially lined Nasmyth pot, which is changed every 12 hours. Matte and lead are

tapped intermittently from spouts at the bottom of both settlers. The matte seldom exceeds 10% of the charge, as the sulphur is kept below 4%; it is taken in small pots to the matte-rolls to be reduced to $\frac{1}{4}$ in. diam. and roasted, in reverberatories (rabbed by hand) for return to the blast-furnace as an iron flux.

The blast-furnaces are set side by side and are fed mechanically² by a charging-car, which is hauled by an electric third-rail system motor over their tops and is emptied into a hopper beneath the rails on the feed-floor of each furnace. This hopper extends over half the length of the furnace, the width of the charging-car being about the length of the hopper, so that the latter can be evenly filled throughout from the drop-bottom of the former, which is hopped crosswise the car's length. The furnace-hopper's bottom can be dumped by a lever on the feed-floor onto a central longitudinal spreader of 'A' section. For filling the charging-car, there is a mixing-hopper beneath the ore-bedding floor into which the different ingredients, brought by barrows from the ore-beds and fuel-bins, are dumped. The charging-car runs under this mixing-hopper, which just fills it, so that the car can then be run to a hydraulic elevator and raised to the level of the blast-furnace feed-floor.

The charge is carried from 18 to 23 ft. vertically above the tuyeres, according to the increase in silica.³ The more silica in the slag, the higher the charge and the heavier the blast-pressure, which may reach 40 oz. per square inch. It is generated by Connersville cycloidal blowers turned by tandem-compound horizontal Corliss engines. A common slag used runs 31% SiO_2 , 22% CaO , and 35% FeO . The lead-fall varies from 8 to 12%, while the consumption of coke is around 12 $\frac{1}{2}$ %.

The blast-furnace smoke descends in a down-comer pipe debouching beneath the feed-floor into a brick settling-chamber of large cross-section; this discharges into a centrifugal blower of some 12 ft. diam. driven by a simple horizontal Corliss engine. The fan forces the smoke through a long cooling-flue into a brick bag-house provided with cotton bags, which are shaken mechanically, at intervals, into steel hoppers whose contents can be dropped into cars for transport to the fume-store-house. Later the fume is briquetted with fine ore in a Chisholm-Boyd & White press and returned to the blast-furnaces.

For sampling, there is a separate building containing two duplicate sets of machinery, each comprising a jaw-breaker, coarse rolls, a Vezin automatic sampler (No. 1), fine rolls, and finally two Vezin samplers (No. 2) set in parallel. The rich custom ores are first sampled, in 2500-lb. lots, by-passing through the first sampling outfit and getting two 100-lb. samples from each of the Vezin No. 2 machines. The rejects are then put again through the duplicate outfit, from the Vezin No. 1 onward, in order to get two more duplicate samples. All four samples are

²'Mechanical Feeding of Silver-Lead Blast-Furnaces,' by A. S. Dwight, A. I. M. E., Vol. XXXII, p. 353.

³'Metallurgy of Lead', by Henry F. Collins, chapter on 'Blast-Furnace Smelting'.

then cut down, by hand-quartering and splitting, before being sent to the assay-office, where a separate analysis is made of each. This extreme duplication costs something to achieve, but it has been found profitable.

The ore-beds are formed on a flat floor at the level of the incoming railway-tracks. They are bounded on the track side by movable loose-plank doors that can be raised gradually as the beds get higher till the level of the box-car floors is reached. The unloading is done by wheelbarrows.

The roasting of the sulphide ores is divided between old-fashioned hand-rabbed reverberatories and the Dwight-Lloyd machine. Of the former there are about a score, each with a single hearth 16 ft. wide by 50 ft. long inside. They roast to a sinter, using soft coal as fuel; petroleum was tried, but was found to heat too unequally. Each furnace handles 18 to 20 tons in 24 hours, with the labor of one attendant per shift. He shoves the charge along the hearth with the aid of a Robinson rabbler. This device consists of two shafts sliding back and forth horizontally below the furnace-doors on the exterior of the hearth, one on each side; a small steam-engine is set between each pair of furnaces and reciprocates the two shafts immediately adjoining. To the moving shafts are attached two vertical bars at each furnace-door; they act as impellers for the rabble, with the aid of the door-frame as a fulcrum. This invention has cut the roasting force in two, and makes the work easier.

The Dwight-Lloyd roasting machine is too well known to need detailed description. As used here, it consists of an endless belt, some 30 ft. between centres and formed of cast-iron herring-bone grate-bars, with side rims to keep the charge from falling off, and supported on each side, between the end pulleys, by a track, which is run on rollers set on the end of each grate-bar. Falling from the hopper onto one end of the belt, the charge passes under an ignition flame at once, and is kept burning until it reaches the discharge end of the belt, where it falls off into a hopper, in a lumpy sintered condition ready for the blast-furnace, and thence can be spouted to a car below running to the ore-beds. The draft is maintained at 10 in. of water by a Sirocco fan whose intake is set under the endless belt and which blows the smoke up a stack. The charge for roasting must be ground to 20-mesh and moistened with water in a revolving helical mixer; it is then fed automatically onto the belt in a layer 2 to 2½ in. thick. The belt-grates are protected against the corrosive action of the roasting gases by a ½-in. layer of limestone, crushed to ½ inch and fed onto the belt in advance of the ore-feed. The latter can contain up to 40% lead, but beyond that it must be diluted with some inert mineral to prevent stickiness. The capacity of the machine is 18 to 20 tons of sulphide ore or concentrate in 24 hours.

The final product of this plant is base bullion (work lead) rich in silver, of which the bulk is shipped to the company's refineries in the United States.

PLANT OF THE CIA. MINERA, FUNDIDORA Y AFINADORA.

This consists of a smelter and lead-silver refinery (Fig. 3) near Monterrey. The refining is the main business here, and the smelting operations are therefore small as compared with the A. S. & R. plant. There are nine full-size and one smaller blast-furnace. The former can smelt 90 tons of charge per day using around 15% of coke and a lead-fall of 10 to 12%. A common slag is SiO₂ 34%, FeO 26%, and CaO 23%, the matte-fall being kept under 5%. The blast-pressure is 24 oz. per square inch and is maintained by one large and one small Connorsville cycloidal blower each direct-connected to a simple Corliss horizontal engine. The furnaces are fed by hand through vertical side-doors above the feed-floor and carry a 15-ft. smelting column above the tuyeres, which number six of 3½ diam. on each side. There are only four flanged-steel water-jackets to surround a rectangular hearth 10 ft. long by 3½ wide; as these jackets are only 4 ft. high the smelting column has to be kept of moderate height in order to prevent cutting out the brick lining above the jackets. The slag is tapped intermittently directly from the furnace into a conical settling-pot, which, before pouring into a Nasmyth slag-car for haulage to the dump, is partly cooled and settled. The matte is crushed, roasted, and then smelted in one of the blast-furnaces operated for producing a copper matte for shipment. The shells of the settling-pot are broken up and returned to the ore-charge of the blast-furnace.

The roasting is done mostly in 16 by 50-ft. single-hearth reverberatory furnaces, which are rabbed by the old type of unaided hand-hoes, yielding a sintered product. There is also a Pearce single-deck rotary roasting-hearth, which gives better satisfaction than the hand-furnaces. The fuel for all roasters is Mexican crude petroleum.

The sampling here is unworthy of special notice, as it is done by the usual hand-methods of split-shoveling and quartering by coning.

The refinery buys base bullion and cyanide-mill precipitates, and delivers pure and hard-lead silver and gold to the metal market. The base bullion is handled by furnaces set on three terraces; the upper terrace has three liquating reverberatories, the middle one has two lead-kettles, and the lowest has five refining reverberatories, of which two are for the base-bullion system, one for leaching mill-precipitates, and one for antimonial lead and other by-products.

The liquating-furnace melts the base bullion slowly and forms, first, a copper scum that is returned to the blast-furnace. The second scum to rise is chiefly antimony and arsenic, and is worked off the bath by the aid of rich litharge from the cupel-furnace and an air-blast. The arsenic is mostly volatilized during skimming, leaving an antimonial product, which is liquated again separately to yield base bullion and an antimonial scum that is run intermittently into the small blast-furnace, in order to get hard lead containing from 16 to 20% of antimony.

The lead-bath of the liquating-furnace after two skimmings is spouted down to the lead-kettle for de-

silverization by the Parkes process.⁴ After first removing a coppery scum, enough spelter is stirred into the bath to take up the silver present. The foreman cupels a sample from the bath to ascertain the silver content. The zinc scum, containing the silver, the gold, and the residual antimony from liquation, is now skimmed and thrown into a press, where it is squeezed dry of lead. This press is worked by compressed air and is lowered over any kettle by means of a traveling crane. The pressed zinc-scum is now carried to the usual Faber du Faure retort-furnace for distilling the zinc from the rich silver-lead residue, which goes to the cupeling-hearth. The latter is started by one charge of rich silver-lead, but is not finished until many similar charges have been added, so that the resulting silver-gold button shall be of considerable size.

The de-silverized lead of the zinking kettle is meanwhile piped by siphon down to the refining-furnace, where it is freed from its residual zinc and antimony by the usual process of volatilization at a high heat combined with slagging in an oxidizing atmosphere by means of litharge created as a scum in the molten bath of lead on the hearth. The bath is skimmed several times for its lead-zinc scum until the remaining scum shows large thin plates of a yellow color quite free from the brown spots of antimony.

While the Parkes process at this plant contains nothing unusual—in fact, such innovations as the use of the water-hose to hasten the work of the zinking kettle seem to be unknown—the Moebius process in the silver refinery presents novel features designed by the local staff. The parting machine (Fig. 4) consists of sheet-silver endless belts, *C*, set 3 high and longitudinally in the electrolytic-vat *V*, which acts as 48 movable cathodes. The anodes, *A*, are plates 12 by 3 by $\frac{1}{2}$ in.; they are cast when ladling off the silver-gold button of the cupel-furnace, and are set in wooden trays, *T*, that have woven-wire covers and checker-work bottoms lined with cloth. The electrolyte filling the vat is a solution of silver nitrate in nitric acid drawn from the porcelain pots used in the boiling of the gold. As the belts make only two revolutions per hour, the silver has a good chance to deposit on them in crystals. The latter adhere so loosely to the greased surface of the sheet-silver that they can be easily scraped off, by mechanically-moved bristle-brushes, into hoppers that spout them out of the vat, whence they can proceed to the melting-furnace and be cast into fine silver ingots for the market. The gold remains as slime on the cloth bottoms of the anode-trays, and is thence taken to porcelain pots, where it is first boiled in nitric and finally in sulphuric acid before casting into bars for shipment. The voltage of this Moebius vat is 100, giving two volts for each of the 48 belts set in series, while the amperage is 250 and the capacity one metric ton per 24 hours.

THE MONTERREY STEEL WORKS. This is really the only complete works for making soft steel direct from the ore

in the whole republic of Mexico. It was built some 20 years ago. As a detailed description of this plant was published soon after its inception⁵, I will not do more here than mention certain economic problems connected with its operation and the Mexican iron industry.

At the time of my visit, the single large blast-furnace was producing 225 tons of pig-iron daily, or sufficient to supply the requirements of the steel furnaces. These now operate by the half and half process, as a set of Bessemer converters has been added to the open-hearth furnaces of the original plant. The blast-furnace is equipped with a skip for automatic feeding, and taps its slag into slag-cars for the dump and its metal into other cars to go direct to the converters. At the start this furnace was intended to utilize only coke and ore from the near-by deposits, but for many years past this policy has been abandoned. The Coahuila coal not only produces coke

FIG. 4. PARTING MACHINE FOR THE MOEBIUS PROCESS

with some 20% of ash, but this ash is so aluminous as to yield a sticky slag, and causes a consequent heavy loss of shots of metal if used alone. By mixing this coke with a third of foreign coke the loss is reduced, but the American foreman estimated that he could easily increase to 500 tons the furnace's maximum output of 350 tons if he could use Connellsville coke and Lake Superior ore instead of the present charge. At first thought the alumina in coke would seem no more harmful in the furnace than that of the ore or flux, but the difference in its action is considerable. This is because the alumina of the latter materials can combine into slag some distance above the tuyeres, near the top of the zone of high temperature, and descend harmlessly as a liquid to the slag-bath below. The alumina of the coke, on the contrary, is not set free until its carbon matrix is quite consumed, an event that does not occur until the coke reaches the zone of combustion, just above the tuyeres, where the plentiful shots of just reduced metal are easily ensnared and held by the sticky aluminous ash.

The great expectations for the ore deposits of the company, near Golondrina, Nuevo Leon, were disappointed after a few years of production. Showing large outcrops of high-grade hematites and magnetites of Bessemer quality, these orebodies, like many others of the contact type, became so pyritic in depth that their use had to be

⁴'The Metallurgy of Lead', by H. O. Hofman.

⁵'Steel Plant at Monterrey, Mexico', by William White, Jr., A. I. M. E., Vol. XXXII, p. 344.

limited to a fraction of the ore-charge. Fortunately for the enterprise, a huge deposit of rich ore exists in the Cerro de Mercado of Durango City⁶ and for over a decade this 'iron mountain' has been the main source of supply for the steel works, despite the fact that the transport involves a rail haul of 646 km. In view of these facts, some might prefer Torreon to Monterrey as a site, had the steel works to be re-located. Torreon is only 253 km. from Durango City and but 160 km. farther than Monterrey from the Coahuila coalfield. For the transportation of the finished products—rails, shapes, bar-iron, and castings—the two sites are equally advantageous, both being some 1000 km. away from the centre of consumption and population near Mexico City. Others might go even further than change the site and question the wisdom of maintaining such a steel works at all, when it has available neither the accessible raw material nor the proper quality of labor to enable it to undersell the imported steel, and must therefore be subsidized by a protective tariff at the expense of the great natural metal industries of Mexico—those of silver, gold, lead, and copper.

Mining in Montana in 1919

The metal output of Montana declined notably after the war demands for metals ceased. The period of transition from war to peace was one of curtailed production and lower prices for copper, lead, and zinc. Production from the mines at Butte, the source of most of the State's output, was reduced during the first half of 1919 to nearly half that of the first half of 1918. Several of the large copper mines were closed, and the smelters at Anaconda, Butte, and Great Falls were operated on a greatly reduced scale. Though production was low at the Washoe smelter at Anaconda, the plant was being improved, the new stack and Cottrell treaters having been completed and connected with the furnaces. This new equipment will afford a large output of arsenic.

GOLD. The gold produced in Montana in 1918 was valued at \$3,104,764, a decided decrease from the output of 1917. The placer gold produced by dredges in Madison county is falling off rapidly, and even the gold obtained from dry or silicious ores is decreasing in Lewis and Clark, Phillips, Fergus, and Deer Lodge counties. The gold produced from the ores of Butte increased in 1918, on account of the large output of copper ore and the activity of the zinc leaching plant at Great Falls, but there will be a marked decrease in 1919 because of the reduction in the output of copper ore. During the first quarter of 1919 the Barnes-King Development Co. received \$189,060 for ore milled at the Shannon, Piegan, Gloster, and North Moccasin mines. The two mines last named were operated at a loss, but the ore from the Shannon mine was sufficiently valuable to pay expenses and dividends.

SILVER. The output of silver from Montana in 1918

was 16,797,479 oz., valued at \$1 per ounce, or nearly \$6,000,000 more than the output of 1917. This is the largest output of silver recorded for the State, and is larger than that of any other State, but the rate will not be upheld in 1919, even though the price of the metal has improved, because of the declining output of the ores of the base metals from which the silver is derived. Nearly 90% of the silver produced in Montana in 1918 came from Silver Bow county.

COPPER. The output of copper in 1918 was 323,174,850 lb., valued at \$79,824,188. Several years ago Montana was the largest producer of copper in the United States, but in 1918 Arizona produced more than twice the quantity given above. The shipments of copper ore and bullion for the first five months of 1919 indicate an average production of about 15,300,000 lb. of copper per month, as against an average of nearly 27,000,000 lb. per month in 1918. Several of the large mines of the Anaconda Copper Mining Co., such as the Original, Leonard, and Pennsylvania, were closed early in the year, and the production of the North Butte was reduced by more than 50%. At the Pittsmtont smelter only one copper furnace was active in the latter part of March.

LEAD. The output of lead from Montana was 37,135,875 lb. in 1918, a notable increase over the 21,951,220 lb. produced in 1917. Much of the lead produced in 1918 came from Jefferson and Lincoln counties, but most of it came from the Anaconda properties, Butte & Superior, Emma, and Elm Orlu mines at Butte. Much lead-zinc ore has been opened at the Emma mine and at properties in the western part of Butte, and shipments continue from the main producers, but there will undoubtedly be a decided decrease in production in 1919. Shipments of lead bullion from the East Helena plant were upheld, but most of the ore that is sent to this plant is produced in Idaho. A large quantity of lead ore is being shipped from the Angelica mine, in Jefferson county.

ZINC. The production of zinc in Montana in the first half of 1919 has been somewhat reduced, but not so much as in some other Western States. The output of zinc in 1918 was 209,258,148 lb., valued at \$19,042,491, or 9.1c. per lb. Most of it came from the mines at Butte—Butte & Superior, Elm Orlu, Emma, and several mines at Anaconda—and nearly all the remainder came from the Snow Storm mine at Troy, and the Pilgrim property, at Basin. All these mines were active in 1919, and the electrolytic zinc plant at Great Falls continued to turn out spelter of high grade, though the total output was somewhat less than in 1918, when an average of about 6,000,000 lb. of zinc was shipped each month. During the first quarter of 1919 the Butte & Superior mine produced about 7,000,000 lb. of gross zinc per month, against 11,500,000 lb. per month in 1918. The decrease was due to the Anaconda company's refusal to take custom zinc ore in the first months of 1919. The later shipments were about 80% of normal.

Dividends were paid by the Anaconda Copper Mining Co. and the Barnes-King Development Co. in the early part of 1919.—C. N. Gerry, U. S. Geological Survey.

The Fundamental Principles of Safeguarding

By SYDNEY J. WILLIAMS

*If you want your plant to be 100% safe, it is necessary to guard every moving part, wherever located, on which a workman might be injured if he came in contact with it in any way or from any cause whatsoever. If the moving part is in a place 'where nobody ever goes', remember that some one is likely to go there sooner or later in connection with the repair or maintenance or alteration of the machinery itself or of the building, or for some other reason that you cannot anticipate. You probably have heard the story—perfectly true—of the man whose heel was cut off by an unguarded gear 14 in. below the ceiling. The man was standing on a scaffold, working on another shaft near-by; to brace himself he placed his foot against the shaft on which the unguarded gear was located, his foot slipped, and was caught in the gear. Many similar examples could be quoted of accidents occurring in out-of-the-way places. Recognizing this fact, the Illinois Steel Co. rule-book, to mention only one example, requires that all gears, wherever situated, must be enclosed.

You may be puzzled by attempting to apply this principle to the guarding of overhead shafting and belts. Many shafts contain miles of overhead shafting which it is almost a physical impossibility to guard. On the other hand, oilers and repairmen are frequently injured, sometimes fatally, on unguarded overhead shafting or belts. The only solution is, if the shafting positively cannot be guarded, to prohibit absolutely any work on such overhead transmission while it is in motion. Shortening of belts and other repair work, as well as oiling, can be done during the noon hour or at night; or, better still, install automatic oilers or oilers that can be filled from the floor by using a special oil-can with long spout. For details, see the National Safety Council's Safe Practices pamphlet on this subject.

A gear or belt or other dangerous moving part which happens to be placed below a table, or in some other place where it is partly hidden, is not thereby made safe. Someone occasionally must reach under the table to sweep or repair the floor or oil or repair the machine. Someone may slip or stumble so that his arm comes in contact with a gear or belt which would be safe for the workman standing in his normal position. The immigrant totally ignorant of machinery—and it is hard for us to realize the completeness of the ignorance on this subject, on the part of foreigners brought up in farming districts—may deliberately put his hand or his finger into an opening that looks interesting, just to see what it is. If he finds that 'it' is an unguarded gear, it is easy to say that the

accident is his own fault, but that does not relieve our obligation to pay his compensation nor does it restore him to his vacant place in the gang.

What I have said of gears and belts applies equally well to any moving part on which a man might be injured: counterweights, cranks, reciprocating parts such as a planer-bed, and so on; also, of course, to the operating point of machines.

Here are a few points to remember:

(1) A safeguard should be so designed and constructed that it will prevent accidents on the part guarded: not accidents to the operator while at his regular work, but also to the operator or passers-by in case they slip or fall or carelessly touch the machine while it is in motion.

(2) The guard should not interfere with production. If it does, it is liable to be taken off. In designing a guard it is generally wise to consult the man who will use it.

(3) In general, the guard should be attached to the machine and not to the floor; if attached to the floor, use a connection that will interfere as little as possible.

(4) The guarded part must be easily accessible for oiling, inspection, and repair. The door or removable section provided for this purpose should be hinged or otherwise attached to the remainder of the guard, or to the machine. If not, it is likely to be left off permanently.

(5) The guard should not interfere with cleaning and sweeping around the machine. It should, therefore, be kept generally about six inches above the floor.

(6) The guard should be strong enough to resist injury and keep its shape. A light flimsy guard soon becomes bent and is discarded. A substantial guard is cheaper in the end.

(7) Incombustible guards are preferred. Wooden guards, soaked with oil, may become a serious fire-hazard. Metal guards are neater and wear much better. "Metal guards look as if you wanted to; wooden guards look as if you had to." Guards may be made of cast-iron, sheet-metal, wire-mesh, expanded or perforated metal, or slats. However, where subjected to acid or fumes, wooden guards may be necessary.

(8) It is desirable to interlock the guard with the operating machines, where possible, so the machine cannot be operated unless the guard is in place.

(9) A safeguard can often be so designed that it will also serve to prevent wear on the parts guarded, for example, a solid gear enclosure.

Let us consider the application of these suggestions to the design of gear-guards. Cast-iron guards are preferred because they may be made to fit more snugly, pre-

*Secretary and chief engineer, the National Safety Council, Chicago; presented at the eighth annual Safety Congress at Cleveland on October 2, 1919.

sent a better appearance, and protect the gears from dust and injury. In shops having similar gears on several machines, the cost of patterns and cast-iron guards will be no greater than the cost of 'built-up' guards. A cast-guard of one machine may be used as a pattern for making guards for similar machines.

Guards for a variety of machine, and in many sizes, may be more cheaply made of sheet-metal. In large guards, an angle-iron is used to make the joint between the flat sides and the curved part of the guard. In smaller guards this joint may be made by cutting projections, like saw-teeth, on each side piece and bending those over to form a smooth curve. The joint may then be made either by spot-welding or by riveting. Short pieces of angle-iron may also be used to form the joint—about $\frac{3}{4}$ by $\frac{3}{4}$ by $\frac{1}{2}$ in. angles, one inch long, 3 or 4 inches apart.

Gears should be completely encased; or, where this is impracticable, should have a band-guard with side flanges extending inward beyond the root of the teeth. If there is a spoke-hazard, the gear should be completely enclosed, or filled in between the spokes.

Bolts, fly-wheels, shafting, and large gears are often guarded by an open-work rather than a solid enclosure. Such guards should be so designed that no one can get his hand or his finger into the danger-point even if he tries. If the guard comes within four inches of any danger-point the opening should not be greater than half an inch square, which is small enough to exclude fingers. If more than four inches away, which is about the maximum length of a man's finger, the openings may be larger than half an inch, but not larger than two inches square, which is small enough to keep out a man's hand. If a slatted construction is used the slats should not be more than one inch apart.

The safety engineer's greatest difficulty is in guarding machines on which men are working. Let me repeat that it is very important not to attempt to guard machines in a way that will interfere with production. The great majority of both foremen and workmen will object seriously to such a guard, will use it under protest, and when the opportunity arises they will take it off and not put it back. I have time to mention only two examples: the circular saw and the punch-press.

A guard is not the only essential for safety in operating a circular saw. For ripping, it is important that the saw be provided with a splitter. Keeping the saw sharp and properly set will greatly decrease the danger of throwbacks. The floor where the operator stands should have a nonslip surface. Many shop-men say that it is impossible to guard a circular saw without interfering seriously with operation. The safety rule-book of a large company contains a similar statement. In a great majority of the wood-working shops that I have visited, some, at least, of the saws have not been guarded or some of the guards have not been in use. I remember, however, two wood-working shops where every saw was guarded and every guard was in use: the Westinghouse Electric & Manufacturing Co., at Pittsburgh, and the Commonwealth Steel Co. at Granite City. There doubt-

less are others but I do not happen to have seen them. In each of these two shops every circular saw was provided with a guard that completely covered it when not in use and which rose automatically from the table as the stock was inserted. I watched men operating these saws and the guards did not seem to introduce the slightest difficulty. They were of light construction and when the stock was shoved in they rose without apparent effort, the larger ones, at least, being counterweighted. The men in charge of these departments told me that the guards did not interfere at all with production, in fact that the men now would not work without them because they felt that they were so much safer. I do not blame the workman or the foreman who objects to using a cumbersome, heavy, non-adjustable guard.

Special work on circular saws sometimes is difficult to guard. In some cases, these difficulties may be overcome by careful study. In a few cases they probably can not, and the guard must be temporarily laid aside, being hinged or pivoted for that purpose. Where this must be done, another safeguard can often be introduced. For example, in grooving the edge of a board, provide an auxiliary guide or fence, so that there will be a guard on each side of the saw, thus keeping hands away from contact with it.

The punch-press, using that common term to include all kinds of power presses, has, with the circular saw, the doubtful honor of causing more injuries, and especially more permanent injuries, than any other kind of machine. Where possible, the best guard is an enclosure around the plunger, which makes it impossible to get one's fingers underneath. Often, however, this is impossible. In such a case, let me suggest that instead of buying a dozen or a hundred of some so-called safety device, and putting it on every punch-press in the shop, you start with one individual press and study the operation carefully in co-operation with the superintendent, foreman, master mechanic, and operator of the machine. Ask yourself why accidents happen or why they may happen on the particular press you are studying. The answer will be that, for one reason or another, the operator finds it necessary or convenient to put his hand under the plunger, either regularly or occasionally. The way to make the operation safe, then, is to arrange it so that the operator need not and will not put his hand under the plunger. Sometimes this may be done by cutting away a portion of the dies so that the operator can keep hold of a part of the piece being formed and still not be injured. Often it may be accomplished by introducing an automatic or a foot-operated kick-out. This almost always increases production as well as safety. Sometimes it is found practicable and advantageous to interchange the upper and lower dies. Sometimes the method of operation may be altered; I have in mind one case where, in riveting the handle-socket onto a kettle, the operator laid the rivets in position after the kettle was in the machine and sometimes the plunger came down and caught her finger. After a good deal of study the superintendent arranged to have another girl place the rivets in position and hand the kettle to the oper-

ator, who then placed it in the press and completed the operation, obviously without danger and obviously with a great saving in time as well. In a great many cases, where the same operation is continued for a long time on one press, it will be found economical to provide some sort of automatic or semi-automatic feed; this also always increases production as well as removing the hazard. Gate-guards and two-handed operations are sometimes necessary, but should be used only as a last resort. The methods above are more efficient because they go to the root of the matter and remove the hazard rather than merely guarding it. When you remove the hazard you simplify the operation and therefore increase production. When you merely guard the hazard you may decrease production.

What I have said of the punch-press is typical of many machines. Safety engineering does not consist in simply building wire mesh-guards, nor in buying safety devices that look pretty in a catalogue, and putting them on the machine without regard to the wishes, the convenience, or the efficiency of the operator. The real safety engineer will, where necessary, study the operation of a machine until he understands it as well or better than the operator himself; as well as the foreman, the superintendent, the master mechanic; and then he will apply their brains and his own in working out either a guard, or a change in the machine, or a change in the operation, which will remove the underlying hazard and make the operation intrinsically safe.

FIGURES COMPILED by C. E. Siebenthal, of the U. S. Geological Survey, from reports submitted by all zinc smelters which operated during the first six months of 1919, show that the production of zinc from domestic ore in that period was 247,584 short tons and from foreign ore 7918 tons, a total production of 255,502 tons, as compared with 260,664 tons in the last half of 1918 and 257,263 tons in the first half. The stock of zinc held at smelters on January 1, 1919, was 41,241 tons and on June 30 it was 59,651 tons, an increase of 18,410 tons. The stock on June 30, 1918, was 44,502 tons. The stock of zinc held by the War Department on May 29, 1919, was reported as 39,000 tons, 9000 tons of which was held at producers' plants and the remainder at plants which had been engaged in making munitions. In July the Government stocks were reported as 21,000 tons of grade A and 5000 tons of all other grades. The latest invoice by the War Department, August 30, shows 10,821 tons of slab zinc and 66 tons of sheet zinc. The decrease in Government stocks was due in part to the purchase of Government holdings of their own brands of high-grade spelter by the larger producers. From the foregoing figures and the records of the Bureau of Foreign and Domestic Commerce it is calculated that the apparent consumption for the period was 159,501 tons, as compared with 212,660 tons in the last half of 1918 and 211,870 tons in the first half. In addition to the zinc produced from ore, 7328 tons was re-distilled from zinc ashes, skimmings, and drosses. Much of this was of good grade.

Comparison of Labor and Other Costs for Five Years

Alaska United Gold Mining Company

Short Cuts in Mine Surveying—I

By DOUGLAS WATERMAN

PREFACE. The aim of these articles is to furnish a few practical notes on the choice and use of surveying instruments, and to point out how many of the problems which arise in every-day practice may be treated in a simple yet satisfactory manner.

Unnecessary refinements in engineering are a waste of time and therefore of money. The choice of the method to employ in obtaining desired information should be governed by the importance of the work. The shortest way is the best provided the results are within the allowable degree of accuracy.

The theory of surveying is fully covered by the many text-books on the subject, but there are short cuts in actual practice that the engineer learns either for himself or under the guidance of an experienced chief. The methods herein described were acquired in just that way, and it is hoped that they will be of help to others.

THE COMPASS. A Brunton compass is the simplest; it is one of the most useful of all surveying instruments. It is indispensable to the mining engineer whose work more often calls for rapid, rather than precise, surveying. When the use of the compass is thoroughly understood, one grows more and more accustomed to rely on this simple instrument for directing the course of development work and minor connections, for surveying large stopes and excavations, and for securing such data as the dip and strike of faults and other geological features in the mine, and in topographical and reconnaissance surveys, in which magnetic bearings are usually all that is required.

THE TRANSIT. For general surveying the lighter type of transit is recommended. The larger and heavier transits, owing to their rigidity, the power of the telescope, and the size of the graduated plate, are undoubtedly superior instruments where extreme accuracy is required, but for all-around work the lighter transit will be found a more serviceable instrument. It weighs only a few pounds and is compact when fitted in its case. Strapped on the back it can be carried into any part of the mine no matter how difficult of access. Surveys in the field that require the instrument to be carried long distances in the day may be accomplished without excessive fatigue.

The workmanship on these instruments is as perfect as on those of larger size. The plate is accurately graduated, and although it is difficult to read the vernier with the naked eye, it can be clearly distinguished with the aid of a reading-glass. In the field the lower power of the telescope will require shorter sights and more frequent set-ups, but this is more than compensated by the ease with which the instrument can be handled.

Standard instruments usually combine every desirable

feature, but when ordering a transit it would be well to specify the following details and accessories.

1. **Horizontal Circle:** Preferably a 4-in. plate, graduated on silver, with two rows of figures— 0° to 360° —reading in opposite directions, and a double vernier reading to minutes.

2. **Vertical Circle:** This should also be graduated on silver and provided with a double vernier reading to minutes.

3. **Telescope:** Many engineers prefer an erecting telescope, but it should be specified whether an erecting or an inverting telescope is desired.

4. **Stadia-wires:** These are usually fixed in the ratio of 1:100.

5. **Punch-mark:** The telescope should be provided with a punch-mark on top to enable the instrument to be centred from a point above.

6. **Finish:** The so-called 'leather' finish is preferable. This is a non-conductor of heat and affords relief to the eyes when working in bright sunlight.

7. **Cover-glass:** The glass cover to the needle should be cemented in place to prevent the accumulation of moisture, which may cause the needle to stick.

8. **Auxiliary telescope:** Required for the work of mine surveying.

9. **Split extension-tripod:** This is the best style, as it combines lightness and service with the maximum of rigidity.

10. **Transit-case:** This should be as compact and as light as possible, and provided with leather cover and shoulder-straps to facilitate transport underground.

THE LEVEL. While accurate leveling can be done with the mining transit when in perfect adjustment, there are occasions when a more precise level is required. Such an instrument will be found in the dumpy level, which is recommended on account of its simplicity, strength, compactness, and permanency of adjustment.

A hand-level will often serve in determining comparative elevations, in preliminary surveys for roads, ditches, and grade work, and in forming estimates for cut and fill.

The Philadelphia rod is an excellent pattern. It can be used both for leveling and stadia work, being self-reading up to 300 or 400 ft. It is well to have two sizes; one 7.3 ft., extending to 13 ft., and the other 3 ft. extending to 5 ft. for mine use, both provided with a target and vernier reading to 1000ths.

A rod-level is of great assistance in holding the rod in a vertical position for stadia measurements.

Before attempting any of the adjustments involving the telescopic line of sight it is necessary to bring the cross-wires into sharp focus, and at the same time to

eliminate parallax. Point the telescope to the sky and by turning the eye-piece, move it in or out until the cross-wires are sharply defined. Direct the line of sight to some distant object and focus clearly on a definite point. If, when the eye of the observer is moved slightly in any direction, the point appears to move in relation to the intersection of the cross-wires, there is still some parallax, and the eye-piece must be moved slightly until it is eliminated.

The three essential adjustments of the engineer's level are:

- (a) Collimation adjustment.
- (b) Bubble adjustment.
- (c) Y adjustment.

(a) Having set up the instrument and corrected for parallax in the manner just described, proceed with the collimation adjustment, the purpose of which is to place the intersection of the cross-wires in the prolongation of the optical axis of the object-glass at focal distance from the lens.

Direct the telescope so that the vertical wire is tangent to the vertical profile of a building or suspended plumb-line. Turn the telescope half-way round in its wyes. If the vertical wire is still tangent to the line selected it may be considered as collimated. Do the same with the horizontal wire, employing some horizontal line for the test.

To adjust the line of collimation, each cross-wire must be brought half-way back to its respective vertical and horizontal line on which the sight was taken. To do this, slightly loosen one of the capstan-headed screws controlling the reticule and tighten the opposite screw, thus moving the cross-wire, in the case of an erecting telescope in the direction of the observed error, and with an inverting telescope, in the direction as if to diminish the error. To test the correctness of the adjustment, set the intersection of the cross-wires on a distant point by means of the leveling and tangent-screws, and carefully return the telescope to its original position. If the intersection of the cross-wires still cuts the point the telescope is collimated.

(b) By the first adjustment the intersection of the cross-wires has been placed in the optical axis of the telescope. The object of the second adjustment is to make the axis of the bubble-tube parallel to the optical axis, in order that the line of collimation may be truly horizontal when the bubble is brought to the centre of the tube.

There is more than one method of making this adjustment, but the 'peg method' has the advantage of extreme accuracy, and is therefore recommended. Place the instrument mid-way between, and in line with, two stakes set approximately 270 ft. apart on nearly level ground. After carefully leveling the instrument, particularly over one set of leveling-screws placed in line with the stakes, sight on the rod held in turn on each of the two stakes *A* and *B* (Fig. 1), and record the readings to 1000ths, in the form of notes here shown. Since the instrument is equidistant from the two stakes, all errors due to mal-

adjustment of the instrument and the effect of curvature and refraction are eliminated, and the difference in the reading is the true difference in elevation of the stakes.

Move the instrument beyond one of the stakes a distance equal to one-tenth the interval between the stakes, which in this case would be 27 ft. Level the instrument carefully and read the rod held on *B*.

If the effect of curvature and refraction could be disregarded, the true difference in elevation between *A* and *B*, added to the rod-reading on *B*, if *B* is higher than *A*, and subtracted if *B* is lower than *A*, would give the target-setting for a level sight to *A*, provided the instrument were in perfect adjustment. The combined effect of curvature and refraction for 200 ft. sight, however, is 0.001 ft. and varies as the square of the distance. For the distance chosen, namely, 300 ft., the correction is 0.002 ft. This is always a positive correction and must be added to the algebraic sum of the reading on *B* and the true difference in elevation between *A* and *B* to obtain the rod-reading of a level sight to *A*.

Take a rod-reading on *A*. The difference between this and the calculated reading is the error due to maladjustment of the instrument for the distance *BA*. As the correction must be made for the distance *DA*, which is $11/10 BA$, the error is multiplied by this factor. By noting whether the reading on *A* is higher or lower than the calculated reading, the correction may be properly applied. Set the target at this point on the rod. With the rod held on *A*, bring the horizontal cross-wires to cut the centre line of the target. Turn the telescope 180° and bring the bubble half-way back to the centre by means of the capstan-headed screws, and correct the remainder with the leveling-screws.

To test the adjustment, take a new rod-reading on *B*, add the correction for curvature, and subtract the sum from the calculated target-setting for the level sight on *A*. The difference between this result and the true difference in elevation between *A* and *B* is the amount of error in adjustment still remaining, which can be reduced to 0.001, and should never exceed 0.003 feet.

TAPES. The 100-ft. steel tape attached to a reel is indispensable. A 500-ft. tape on a reel is likewise of great use, especially about a mine, where accurate vertical and slope measurements of more than 100 ft. are frequently required. A 6 or 8-ft. pocket-tape is a convenience in measuring the offsets in underground surveying, the width of the vein, and various other short measurements for which a longer tape is cumbersome.

A tape-mending outfit consisting of a combined cutter and riveter and a package of copper eyelets should be included.

DRAWING INSTRUMENTS. The number and assortment of drawing instruments is much a matter of individual taste. A few good instruments, however, will give better service than a larger assortment of an inferior make. The list here given is for a well-equipped drafting-room.

Compass with two steel points, pen, pencil, needle-point, and lengthening-bar.

Beam compass for railroad curves and large circles.

| <u>Instrument at C.</u> | | <u>Instrument at D</u> | |

Fig. 1

Drop-spring bow-pen; spring-blade for very small circles.

One or more drawing-pens.

Proportional dividers with rack movement. This instrument will be found useful in map-making, as it is often convenient to plat on a larger scale than the finished map.

The draftsman's steel protractor; blade $8\frac{1}{2}$ in. long, graduated on one side to degrees, with vernier reading to 5 minutes; flush on both sides so that it can be used either side up, and on both edges of the blade.

Rolling parallel-ruler of german silver. This is an indispensable aid to rapid work. Its use will be explained in detail hereafter.

A steel straight-edge when used in conjunction with the parallel-ruler and triangle takes the place of the T-square, which is an unsatisfactory tool unless the table is perfectly true, and great care exercised in its use.

The pantograph is useful in reducing maps. While the more precise instruments are costly, an inexpensive pantograph constructed of wood will serve for rough reductions.

Set of 30° and 60° transparent triangles.

French curves, architect's and engineer's scales.

CARE AND USE OF INSTRUMENTS. In order to obtain accurate results and ensure permanency of adjustment the greatest care should be exercised in handling instruments in the field, and preserving them from injury when not in use.

Handle the instrument carefully when lifting it from, or replacing it in, its case; holding it firmly by the base, and not by the standards, telescope, or circles.

The instrument-case is designed by the maker to hold the instrument in a certain position. On receiving an

instrument, study the mode of packing, in order that time may be saved in fitting it in position, and danger of improper packing avoided. Before placing the instrument in its case the foot-plate should be made parallel to the instrument proper, and brought to a firm bearing with the leveling-screws.

Hold the instrument firmly when attaching it to the tripod-head. The lower motion should be loose so that the instrument may be screwed on with the left hand without relaxing the hold with the right. By first turning the instrument-base in the direction of unscrewing, the threads may be more easily engaged, after which there is little danger of cross-threading. With instruments that fit in a socket the same care should be observed in seating them securely on the tripod-head. When the instrument is finally seated, tighten firmly that it may not become loosened afterward.

The bolts that secure the legs of the tripod to the head are apt to work loose, and the instrument becomes unsteady some time before it is noticed. They should be tested often. Experience will indicate to what extent the thumb-nuts should be tightened to preserve steadiness in the instrument and still allow free use of the tripod-legs. Never force the screws when leveling the instrument. Should one set bind, loosen the opposite pair. If the instrument has been so set up that it requires nearly the full limit of the threads to bring it to the level position it is better to re-set it, remembering that the instrument will lose its steadiness if the threads become worn. Be sure that the leveling-screws are firmly seated on the plate without being unduly strained.

Always carry the instrument with its main motion slightly clamped. If allowed to swing loose, the centres will become worn; if too tightly clamped, there is danger

to the instrument if the telescope should be accidentally struck against a rock or limb of a tree.

When adjusting the cross-wires always loosen both sets of capstan-headed screws before attempting to move the reticule.

Keep the needle clamped at all times except when the instrument is set up and leveled. Clamp before picking the instrument up to move to a new position.

ADJUSTMENT OF INSTRUMENTS. If the instrument is out of adjustment generally it is best not to attempt the completion of any single adjustment, but to repeat the whole series until the instrument is in nice adjustment.

1. The object of the Y adjustment is to make the axis of the bubble-tube perpendicular to the vertical axis of the instrument. When this is accomplished the telescope will remain level when turned in any position about the vertical axis.

Bring the telescope in line with one set of leveling-screws and carefully level the instrument in both directions. Turn the instrument about the vertical axis 180°. If the bubble still remains in the center of the tube, the instrument is in adjustment. If not, correct one-half the deviation with the leveling-screws and the remainder with the capstan-headed nuts at the end of the level-bar. Turn the nuts equally, starting that nut first which is on the side toward which the level-bar must be moved.

Next comes the adjustment of the dumpy level.

a. **Bubble-tube adjustment.** Level the instrument carefully, particularly over one set of leveling-screws. Turn the telescope 180° about the vertical axis and note whether the bubble still remains in the center of the tube. If there is any change in its position, bring it half-way back by means of the leveling-screws and correct the remainder with the capstan-headed screws that raise or lower the bubble-tube.

b. **Collimation adjustment.** This is accomplished by the "peg method" already described under the bubble adjustment of the Wye level. Since the level-bar is rigidly attached to the telescope in this instrument, the procedure is the reverse of that employed in the engineer's level. The bubble-tube is first made perpendicular to the vertical axis and, afterward in the second adjustment, the line of collimation made parallel to the axis of the bubble-tube.

When the correct target-setting is determined, as in the adjustment of the engineer's level, the bubble is brought to the center of the tube and the horizontal wire moved or lowered until it crosses the center line of the target, care being taken that the bubble is still in the center of the tube after the adjustment is made.

Now the engineer's水准 is to be adjusted.

c. **Plate-bubble adjustment.** With the bubble-tube parallel to the vertical axis, loosen both sets of leveling-screws, level the instrument carefully and revolve the alidade 180°. If the bubble is still in the center of the tube, the instrument will remain in a horizontal plane when the instrument is revolved about the vertical axis. If the bubble no longer remains in this position, bring it half-way back to the center by means of the capstan-

headed screws, and correct the remainder with the leveling-screws. It will probably be necessary to repeat this adjustment several times before it is perfect.

d. To make the vertical wire vertical. Sight on a suspended plumb-line or the edge of a building. Carefully loosen the capstan-headed screws and turn the ring holding the cross-wires until the wire is vertical.

e. **Collimation adjustment.** Set up the instrument in a stretch of open and fairly level ground and sight on a nail driven in a stake at a distance of 200 or 300 ft. from the instrument. Place a smooth object, such as a block of wood or a short board, at an equal distance in the opposite direction. Transit the telescope and direct the assistant in making a pencil-mark on the board exactly in the line of sight. Unclass the main motion of the instrument and sight on the nail. Again transit the telescope and establish a second point on the board. If the adjustment is perfect, these two points will coincide. If it is not, move the vertical wire by loosening one screw and tightening the other until the line of sight cuts the point one-fourth the distance between the two pencil-marks. Repeat the operation until two pencil-marks successively established coincide.

f. To make the horizontal axis perpendicular to the axis of the instrument. Set the instrument near some high point, such as a flag-pole, tall building, or high bluff. With the telescope direct sight on a fixed point at a high angle and clamp the horizontal motion. Turn the telescope down and set a point on a level with the instrument. Transit the telescope and again sight on the high point. Turn the telescope down and set a second point by the side of the first, and bring the line of sight to cut a point half-way between them. Raise the telescope until the high point appears on one side of the vertical wire. Raise or lower the adjustment end of the horizontal axis until the horizontal wire cuts the point.

g. The telescope bubble adjustment by the "long method". This is carried out in precisely the same manner as already described under bubble adjustment of the engineer's level.

If an engineer's level is handy, a rapid adjustment of the transit-level may be made by placing the two instruments side by side and as nearly as possible at the same height. By sighting through the former instrument a distant object may be chosen on the same level with it, so which the cross-wires of the transit-level are adjusted.

h. **Vertical-circle vernier.** The vertical circle should read zero when the bubble under the telescope is in the center of the tube. If the zero of the vernier and the scale do not coincide, loosen the screws that fix the vernier to the standard and shift it to the proper position. Tighten the screws, being careful that the edge of the vertical circle and the vernier are flush.

T. B. COCHRAN.

STRONCHITE, a form of cassiterite, the most valuable ore of tin has been found in many streams in Alaska, and beds of cassiterite have been prospecting and mined at several places in the Territory.

REVIEW OF MINING

FROM OUR OWN CORRESPONDENTS IN THE FIELD

ARIZONA

CONDITIONS AT MIAMI.—U. V. X. HAS PURCHASED CLAIMS.

MIAMI.—The Inspiration concentrator is operating 14 out of its 20 sections at present, there being no change in production. The International smelter is operating two reverberatory furnaces; the third is down for repair but is expected to be in operation again within a few days. Production from each furnace is about 100 tons per day. Last month's production was 13,352,000 lb. of copper. Operations at the Miami Copper Co.'s property continue the same as for the past several weeks, the concentrator operating four of its six sections. Last month's production was approximately 4,900,000 lb. of copper. The erection of the new hoist-house at No. 5 shaft is nearing completion, and the erection of the steel head-frame will be started soon. Van Dyke Copper has resumed sinking its No. 1 shaft after installing a large steam-hoist. The shaft now is 480 ft. deep. Sinking has been greatly facilitated by the new hoist. Bailing is the only method for removing the water found necessary up to the present time, as the shaft is not making water in sufficient quantities to make pumping equipment necessary. If more water is encountered before reaching the orebody, the present steam equipment will be of sufficient size to operate the necessary sinking-pumps. Until the shaft has reached and passed through the orebody, it is the intention of the management to confine its efforts solely to sinking. Lateral development will start after passing through the ore discovered by diamond-drilling at 1170 feet.

More development work has been done in the last month by the Superior and Boston than in any month during the last two and a half years. An important ore discovery was made on the fourth level, where the foot-wall vein has been intersected by a cross-cut. Eight feet of ore averaging 8% copper was found, with the face of the drift still in ore. The extent of the shoot is unknown at present; it will be necessary to drive in both directions along the vein to determine its limits. The importance of the discovery lies in ascertaining that ore exists in this vein, and in demonstrating the correctness of the development program of the property. A cross-cut is being driven on the 800-ft. level to pick up the limestone and black oxide veins as well as to explore hitherto unknown territory. On the 10th level the eastern end of the mine is being opened up 500 ft. east of all previous workings and a cross-cut is being driven to intersect the Old Dominion and Great Eastern veins. On the 1200-ft. level a

cross-cut is being driven north and south for the same purpose. One of the most important pieces of work being done is diamond-drilling from the 1200-ft. level to cut the Old Dominion vein in the Pinal schist below the lower diabase sill.

JEROME.—The United Verde Extension Copper Co. has purchased the eight patented claims of the West United Verde Copper Co. for a quarter of a million dollars. According to a statement made by George Kingdon, general manager of the United Verde Extension, development of these claims will not be carried out till a more favorable time. Negotiations for the purchase of these claims has been under way for some time. The property in question was located 15 or 20 years ago by Chris Harryhausen, long a foreman at the United Verde mine; eight of the claims were taken over from him by the Jerome Development Co. Exploration was carried on by this company but without success. After a long period of inactivity the Haynes Copper Co. acquired control and spent a considerable sum developing. Soon after the United Verde Extension's discovery, Michigan people took over the claims and organized the Jerome Verde Extension Copper Co. This company spent a quarter of a million dollars in development, and then interested some New York capital and reorganized as the West United Verde Copper Co. It is also announced that the United Verde Extension main haulage tunnel will be ready for operation on November 15. For the present there is to be no change in the tonnage and grade of ore shipped to the smelter in spite of the increased facilities afforded by the tunnel's completion.

According to the engineer's report just issued, the production of the Jerome Verde Copper Co. for the year aggregates 4709 tons with an average content of 9.6% copper. The total cash income was \$108,359. During the past year 2282 ft. of driving and raising and 3106 ft. of diamond-drilling were done. Most of the development has been carried on in the Maintop shear-zone. The future of the company, according to the engineer, will depend on the discovery of new orebodies, there being practically no ore-reserve at present.

PRESCOTT.—It is reported that the Bullard mine has been sold for \$750,000, there being a large cash consideration. Preliminary work on a large scale is being carried on. The White Star group of silver mines at Turkey Creek has been sold. Since last May the owners have carried on extensive sinking and driving which has opened high-grade silver-copper ore. The Blue Jacket

Mining Co., newly organized, has purchased the Blue Jacket claim situated at Crown King for \$50,000. This claim is contiguous to the Silver Crown mine in which there was recently made a discovery of considerable importance. A discovery of rich silver ore has been made at the Silver Crown Mining Co.'s mine. The tunnel that was being driven penetrated a zone which showed 2 ft. of 110-oz. silver ore and 4 ft. of milling ore. The Postmaster and Money Metals groups of claims in the Big Bug district near Poland are being revived by W. J. Torback. New machinery has been ordered for development and is being freighted in. The company proposes driving a tunnel which will cut the vein at a depth of 500 ft. from the surface.

COLORADO

CRIPPLE CREEK AND LEADVILLE NEWS.—OLD PANDORA MILL BURNED DOWN.

CRIPPLE CREEK.—A leasing company similar to the Isabella Leasing company, which was recently incorporated, is being contemplated by stockholders of the Elkton Consolidated Mining & Milling Co. It is understood that the board of directors has been sounded as to the possibility of securing a lease that will ensure development of the Raven Hill estate at depth. Connection will shortly be completed by cross-cut between the Moffat tunnel and the Blue Flag workings. On account of the Blue Flag adjoining the Ida May group of the Elkton company on the north, its development from that direction is impossible. The movement is reported to meet with the approval of many of the stockholders and a special meeting may be called to arrange for the organization of a leasing company. No work is now being done on the estate, except by lessees who are making fair production from the leased territory south of the shaft.

The Isabella Leasing company has the 15th level of the Lee or main shaft of the Isabella Mines company unwatered, and cross-cutting has started for the Buena Vista, Emma, Maloney, Orphan Belle, and other veins that have been ore producers in the past.

LEADVILLE.—With approximately 90% of the present work in the Leadville district already carried on by lessees, a movement is on foot to secure favorable terms in order to bring about the development of properties which have been idle for long. Many of these are known to contain large bodies of silver-bearing ore, although several of the owners are satisfied to await a more favorable time, leaving their ground idle and paying but a light tax on undeveloped property.

A syndicate of local operators headed by John Cortellini, the Joyce brothers, Theo. Zadra, D. Canfield, and others are actively developing the Adelaide Park properties, the Dolomite, General Grant, Laurel, and Echo through the Dolomite shaft. A drift is being driven now to locate the orebody in the first contact, and the syndicate is already planning to sink deeper and also to work through the shaft on the General Grant. A contract for 100 ft. of sinking has also been let by Frank G. Peck.

president of the Portland company of Cripple Creek, on the Clear Grit, in Iowa gulch. Prospecting will be started in this shaft when the station is cut at the 500-ft. level.

Leases have been granted for blocks which are traversed by the Yak tunnel and the monthly output, made by lessees, now closely approximates 10,000 tons. Articles of incorporation have been filed with the Secretary of State in Denver for the Leadville Development Co., composed of local men. The company, which is capitalized for \$100,000, will operate both lode and placer mines in Lake county, Colorado.

TELLURIDE.—The Smuggler Union Mining Co. sustained a heavy loss by fire when the old Pandora mill was burned on October 30. The entire structure was a total loss, together with a large amount of machinery that had not yet been transferred to the new mill. The fire was caused by a defective flue in the assay-office. The mill was a frame structure, covered with corrugated iron, 100 by 150 ft., the assay-office occupying an extension 50 by 75 ft. There were four decks, equipped with 85 stamps, vanner, Wilfey tables, and other milling machinery, much of which was still on the floors, although some had been transferred to other buildings and the new mill. The assay-office was the only portion of the building in use, although at various times separate units of the mill have been run temporarily.

The fire was observed at 8:45 a.m., and a large force of men rushed to the scene, but the water system was frozen, and the delay permitted the flames to obtain headway. Pyrene extinguishers were used but the fire was too far advanced to be overcome by these. The Telluride fire department co-operated with the local men, so that there was a total force of 100 men trying to save the old mill. When the fire got beyond control, all effort was concentrated on saving the nearby buildings, and salvaging a quantity of chemicals and movable equipment stored in the mill. Fortunately the wind direction was favorable, and the flames were swept away from the new mill and other buildings; had the wind veered, no doubt the entire town of Pandora would have been burned out. Interesting incidents in connection with the fire are the facts that although the Tomboy tramway passes directly over the burned mill it was not stopped by the flames, suffering no appreciable damage, and the water plant of the mill remained intact. The loss is estimated to be \$65,000 of which \$50,000 is covered by insurance.

The mill was an interesting structure from a historical viewpoint, as it occupies the site of and is a successor to the first mill built in this district. The Pandora and Oriental mill was built in 1883, running 10 stamps. A few years after its construction it was carried out by a snow-slide. A 20-stamp mill was built to replace it, and in 1887, the New Pandora & Oriental Co. took over the property, transferring it the following year to the Sheridan and Mendota Mining companies. Upon the formation of the Smuggler Union Mining Co. in 1891, the mill was among the properties consolidated, and was remodeled by this company to handle heavy tonnages of ore.

but abandoned a few years later when the new mill was completed.

The three companions of the murdered miners in the Montana tunnel mystery have been indicted for the crime, and are awaiting the next session of the district court.

MICHIGAN

NO INCREASE IN PRODUCTION.—WOLVERINE MINING IN THE FOOT-WALL.

Production figures for the month of October have not yet been compiled, but preliminary estimates indicate there will be no increase over the September showing. The Calumet & Hecla group of mines may show a small

THE SMUGGLER UNION MILL AT PANDORA

increase, but the Copper Range mines and the Mohawk-Wolverine properties will show a slight falling off.

Stocks of copper on hand at the local smelters will be out of the way by the time navigation closes. This is rather unexpected owing to the fact that the accumulated supplies had hitherto been taken to indicate the impossibility of marketing the copper. The probabilities are that the copper has not now been sold, but has gone to Buffalo or New York for storage.

There is an apparently authentic report of the sale of 20,000,000 lb. of Michigan copper to German interests, although details are lacking. Before the War Germany was a heavy buyer of Lake metal, Hamburg taking almost as much Michigan copper as Liverpool, but since the armistice the foreign demand has not returned to anywhere near normal. This 20,000,000 lb. demand from German interests is the first large sale to Germany in many years. It is reported that this was financed by New York banking houses who are not giving any publicity to their plans.

All mechanical operations at the Victoria mine are performed by compressed air, which is compressed in an

underground chamber by the fall of the Ontonagon river. This little mine produced in October 110,160 lb. of ingot copper, an average of 14.4 lb. per ton, which is better than it has averaged for a long time. The Victoria continues to operate at a small profit simply because of its natural advantage in the way of power. The company has developed a social service program so that it rarely loses a workingman. For years this service in a little mining location, away from any sizable town, was looked upon as a fad. Today many of the larger corporations gladly are copying it. It is a recognizable industrial asset at the present time.

The Wolverine mine, near Calumet, for many years recognized as the 'richest little copper mine' in the world, is now getting to a point in its career when plans for removing the pillars are being made. Driving back of the foot-wall found a lot of copper in a Kearsarge lode vein-width of 25 ft. that permitted mining at a profit. The ore once contained 40 lb. of copper per ton. Now it is an exceptional month when the average is 20 lb., and a profit is made on 15 lb. The management had to determine whether to shut-down, after removing the pillars, or to go back through the mine and explore the territory back of the foot-wall. For years the old miners here contended that there could be no ore back of the foot-wall. They said this so often that everybody believed it. But in the end the company decided to explore behind the foot-wall, which resulted in much workable ground on many levels. A lot of supposedly worked-out levels in the Wolverine are today furnishing the bulk of the ore which this property sends to the mills. From the standpoint of the shareholders of the company it is worth getting out. Incidentally the Wolverine-Mohawk tunnel at the stamp-mill at Gay ought to be completed by February 1. The 1250-kw. turbine for the pumps is on the ground and is being set up to be in readiness for operations when the tunnel is completed.

NEVADA

TONOPAH DIVIDE TO RESUME SHAFT-SINKING.—POSSIBILITY OF A STRIKE AT GOLDFIELD.

DIVIDE.—Sinking the shaft of the Tonopah Divide from the 585-ft. level is to be resumed within a short time and will be continued until the sulphide zone is reached, which, according to early estimates, should be at from 700 to 800 ft. The new shaft of the Divide Extension is 200 ft. deep and a cross-cut is being driven east to cut the extension of the rich ore found on the upper levels. The Victory, Belcher, and Belcher Extension, lying along the strike of the main vein of the district where it turns north-west around Gold mountain, are again working on a good scale. As a result of surface exploration during the labor trouble the course of the vein has been definitely determined, and the Belcher, at 200 ft., the Belcher Ex. at 300 ft., and the Victory at 230 ft. are driving toward important objectives. Good widths of mill-ore, with seams of higher grade, have been found on the surface of the claims of the three companies. The Butte, south of and adjoining the Belcher and Victory, is planning to

sink another 50 ft. to a depth of 200 ft. and explore the vein striking south-west from the Victory, believed to be a shoot from the main ore-channel. The south-west vein strikes toward Revert, Silver King, and Mecca.

EUREKA.—The main winze from the 400-ft. level of the Eureka-Croesus has reached the sulphide zone at 300 ft. and at this depth the ore is being broken over a width of 15 ft. The copper content is increasing, with the value the same as the average above the water-level.

MINA.—What is said to have been a record shipment of quicksilver from Nevada was made recently from the Pilot Mountain district, 12 miles east of Mina. The shipment consisted of 99 flasks, valued at \$7400. The principal producers are the Mina Quicksilver Co. and the Mina Mercury Co., the claims of the latter being operated under lease. The ore occurs in irregular deposits and, with the quicksilver, contains lead, silver, gold, zinc, and antimony. It is high-grade, assaying from \$500 to \$1000 per ton over 4 to 6-ft. widths in places. Only the quicksilver is extracted.

GOLDFIELD.—A strike again threatens in Goldfield, started, according to reports, by the man who led the Tonopah-Divide walk-out. Little if any trouble is anticipated. A committee representing a minority of the miners has published a statement in which the Tonopah wage scale, based on \$6 for miners, is asked, but no formal demand has been made on the operators. The wages in Goldfield vary, most of the companies using a bonus system that makes a wage of from \$5 to \$5.50. The workers in their statement claim that living costs are higher than in Tonopah. The General Washington, owning a claim and a fraction south-east of and adjoining the Cracker Jack and on the strike of the vein being developed by that company, is being re-financed for work through the 320-ft. level of the Cracker Jack. One hundred feet of driving will be necessary to reach the General Washington boundary line. The ore-shoot opened recently in the Red Hill south of the Florence fault has proved unimportant. Low assays are now being obtained in a second shoot. Men interested in the Goldfield Development Co. are reported to be negotiating to take over the Yellow Tiger, far south-east of the Florence. Considerable development work with fair results was done in the Yellow Tiger up to 10 years ago. The west cross-cut on the seventh level of the Florence is 373 ft. long and the south-east cross-cut on the same level, at 236 ft. from the south drift, is in the main Florence fault. The average value of the last 7 carload shipments from the Florence Divide lease was \$88 per ton. The 7 cars contained a total of 320 tons of ore. The Adamson, Traynor & McCall lease has made a carload shipment estimated to be worth \$26 per ton and the Dunn lease in the old Engineers' block is preparing a shipment from a seam 18 to 20 in. wide and assaying \$130. In a telegram from New York, A. H. Merrill, president of the Merrill Silver-Lead Co., states that he has been successful in raising \$50,000 for the treasury of the company. The Merrill Silver-Lead, promoted by Goldfield mining engineers, owns claims 10 miles south of here. A. I. D'Arcy, general

manager for the Goldfield Development Co., states that no attempt will be made to operate the mill of the company until spring and that the winter will be devoted to enlarging the plant to 2000 tons daily capacity.

UTAH

OPERATIONS AT THE UTAH APEX.—CAR SITUATION AND SHIPMENTS FROM EUREKA.

SALT LAKE CITY.—The close of the first week of the coal miners' strike finds Utah in the best condition of any coal-producing State in the Union. On November 2 orders were received from the Regional Director of Railroads to hold all cars at convenient points. This resulted in about 45,000 tons of coal being held on the Denver & Rio Grande railroad between the coal mines and Salt Lake City, and, as a result of this order, the coal mines were short of empties for loading. Civic organizations in Salt Lake City sent vigorous protests to Washington, with the result that on November 6 orders were received by the local railroads to release all cars of coal, irrespective of destination or consignee. The Union Pacific Railway is drawing heavily on the Utah mines at present, fully 60% of all run-of-mine coal going to that company. As a general rule, the coal mines have a plentiful supply of labor; only a small percentage of union miners quit work on November 1 and left for other districts. As yet, there have been no reports of coal shortage in any of the metal mining camps of the State.

BINGHAM.—It is announced that the annual report of the Utah Apex company, covering the fiscal year ending August 31, 1919, will not be issued until December, owing to pressure on officials of the company in preparing for apex suits. Important bodies of milling ore have been encountered during the past year on the 100-ft. level and in a winze below that point. Reserves of this class of ore amount to 50,000 tons, averaging 8% lead and 2 oz. of silver per ton. New bodies of shipping-ore were encountered on the 1150, 1225, and 1300-ft. levels, and reserves of this type of ore are estimated at 160,000 tons, averaging 12.5% lead and 4 oz. of silver per ton. The company is devoting considerable time and attention to flotation. Both the local and Eastern executives are of the opinion that excellent results can be obtained from the use of the Minerals Separation process, particularly in the recovery of zinc, which heretofore has been figured as a worthless metal in the smelting of the lead ores. If tests now under way by the Minerals Separation Co. are successful, the process can undoubtedly be adapted to the present mill with a small amount of alteration and additional flotation machinery.

EUREKA.—The railroad car situation, so far as this district is concerned, shows a decided improvement since November 1, the railroads being able to supply all the cars needed. Shipments of ore for the week ending November 7 totaled 118 cars, as compared with 102 cars for the previous week. Of the above total, Chief Consolidated shipped 26 cars; Dragon, 24 cars; Iron Blossom, 13 cars; Colorado, 9 cars; Tintie Standard, 9 cars; Swansea, 7 cars; Eagle & Blue Bell, 7 cars; Centennial-Eureka, 5

cars; Grand Central, 4 cars; Ridge and Valley, 4 cars; Gemini, 3 cars; Victoria, 2 cars; Sunbeam, 2 cars; Mammoth, 2 cars; Primrose, 1 car; Eureka Hill, 1 car. Output from the Tintic Standard shows a decrease, but this was due to change in the manner of loading ore, the loading-station on the slope above Elberta having been torn down and re-erected at a point on the new East Tintic railroad, which is much nearer the mine.

PARK CITY.—Shipments from this district for the week ending November 7 show an increase over the previous week. A total of 1574 tons was shipped, of which the Ontario Silver produced 421 tons; Silver King Coalition, 418 tons; Daly West, 320 tons; Judge M. & S. Co., 301 tons; Daly Mining, 108 tons; and Silver King Consolidated, 55 tons.

Recent developments in the Naildriver mine have been

railway in Big Cottonwood canyon. Contract has been let for the hauling of ore by team, and the first loads were hauled down to valley smelters on November 11. The company is also working on a new vein farther up in the stope, which assays 135.6 oz. silver and 7.1% lead per ton.

BRITISH COLUMBIA

DISTRICT AROUND STEWART IS READY FOR THE WINTER.—
DONOHUE MINE UNWATERED.

STEWART.—This mining centre may be said to be 'all set' for the winter. Although many of its inhabitants have come south to spend the more severe months of the season, there will be some 150 people remaining in the town until spring. A school has been opened and a good class of children has been mustered. In short Stewart,

PORTAL OF THE SUTRO TUNNEL, COMSTOCK LODGE, NEVADA

encouraging, and shipments during the present month will be the heaviest of the year. Development work is progressing satisfactorily in the Park-Utah mine, with good prospects for interesting developments at any time. The face of the south drift is in mineralized matter, with layers of low-grade ore two to four inches wide, with an occasional streak of high-grade galena. Recently a discovery of about 14 inches of high-grade silver chlorides was made in the Three Kings Consolidated mine. This was made in fissure No. 4 while excavating work was being done for the purpose of putting in a higher head-frame. Within a short time several tons were taken out.

ALTA.—Development work in the Emma mine, which was started early in November, following the unwatering of the main shaft, has revealed a streak of high-grade ore, which assays 182 oz. of silver and 42.3% lead per ton, according to G. H. Dern, general manager for the Emma Silver Mines Co. The mine is looking very good at present, according to Mr. Dern. It is operating three shifts, but shipments of ore have been retarded lately, owing to discontinuance of operations on the Salt Lake & Alta

not much more than a year ago deserted and without prospect of rehabilitation, is assuming the aspects of a permanent community and its residents have the utmost faith in its future. Chief among the causes of this sudden development is the discovery of the Premier mine, on which work is to be continued during the winter and from which several shipments of bonanza ore are expected before the spring. The Big Missouri, Joker, Forty-Nine, and Bush also are promising groups of mineral claims, which are confidently expected to prove the mineral worth of the district of which Stewart is the Canadian outlet. While they are not yet proved mines, development in some instances is well advanced, and trial shipments probably will be sent to the smelters this winter. In addition there are many prospects, the surface showings of which are most encouraging, the result being that prospectors and operators predict that Stewart is to be a mining town of first importance in the Canadian North-West, and that this will become more generally recognized during 1920.

On the Big Missouri the drilling has ceased for the

winter, and will be resumed on the return of better weather conditions. Work is to proceed without interruption in the driving of a cross tunnel on the E. Pluribus claim, on which a high-grade body of ore is being developed. The Province group, it is expected, will be developed by diamond-drill next season. Drilling on the Forty-Nine also is finished for the year but a considerable force of men will be maintained during the winter months. The Bush mines, north of the Premier, are being extensively developed with encouraging results, ore of the first grade having been struck. On the New Alaska a tunnel is being driven to open up the orebody. The Nabob group, on Glacier creek, has been bonded by C. G. Skoning and associates of Leadpoint, Washington. An assay of samples from this property secured by Mr. Skoning before the closing of the deal is said to have given returns of \$189 in silver per ton at current prices. Mr. Skoning, who has come south, proposes returning in the spring with the machinery necessary to open up this group.

YALE.—The Joshua shaft at the Donohue mine has been unwatered for the first time since the English company ceased operations, 30 years ago. The workings were found to be in excellent condition and the vein stronger and better mineralized than in any other part of the mine. A new bunk-house has been erected, and accommodation made for a large force of men. New air-compressors have been ordered. Arrangement has been made to drive a tunnel from the lake shore to cut the Joshua, King William, and Tubal Cain veins at the 300-ft. level. Joseph Errington, consulting engineer to the company, has been making a thorough examination of the Aspen Grove mines. As a result a considerable amount of diamond-drilling is to be done to see if the veins persist in size and richness. A number of adjoining claims have been added to the company's property, making a consolidation of 75 mineral claims.

ASHCROFT.—Arrangements are said to have been completed between the Highland Valley Mining & Development Co. and its creditors, and operations at the mine are to be re-started. The creditors are to receive one-tenth in cash and one-tenth at one, two, three, and four months, and the balance in 7% preferred shares.

FORT STEELE.—G. Grundy, who has a lease of the Victor mine at Mouse creek, has started to erect a 50-ton concentrator.

CARIBOO.—On account of the early severe cold weather, dredging operations at Wild Horse creek have been suspended earlier than usual. Development at the Wigwam mine by the Lightning Creek Gold Gravel & Drainage Co. will be carried on under the supervision of John S. Hogan, president and managing director for the company. A shaft will be sunk to bedrock in the old channel in the centre of the company's property.

NELSON.—S. A. Sorenson, C. H. Holme, and P. H. Penerson have discovered silver ore on Vernon mountain and have staked three claims. The vein has been traced for 600 ft. and is one to three feet wide. Assays run from 123 to 167 oz. in silver per ton. It is a 'dry' ore, contain-

ing only traces of lead and zinc. A compressor is to be added to the equipment at the Ore Hill group, and a tunnel will be driven to cut the veins at 500 feet.

ONTARIO

LIGHT RAILWAYS TO SERVE OUTLYING MINING DISTRICTS.—
PORCUPINE MINES INCREASING PRODUCTION.

COBALT.—Metal authorities of Canada have taken careful note of the recent legislation in Great Britain, which makes it a criminal offense to melt down silver coins, and places an embargo on silver exports. In Canada the rate of exchange with the United States, although not altogether alarming, and not yet sufficient to place the value of the silver in each coin on a parity with the value of the coin itself, is, nevertheless, quite threatening. Further advance in quotations for silver, and increased rates of exchange might compel Canada to adopt similar legislation as that enacted in England, according to the opinion of mine operators.

Official advice from the Department of Mines to the correspondent of the 'Mining and Scientific Press' conveys the information that the Provincial government has "entered into a temporary arrangement with Mr. Sollo-way, who desires to construct light railways along the lines of those used in France for transportation of munitions", these lines to be constructed for the benefit of the outlying mining districts of Northern Ontario, such as Gowganda, Fort Matachewan, Larder Lake, and Boston Creek. The announcement has aroused keen interest in the districts affected. The granting of a charter is said to be under consideration.

According to advance official information, the annual report soon to be issued by A. A. Cole, mining engineer for the T. & N. O. Ry., shows that during 1918 some 212 mines shipped silver ore from Cobalt amounting to 17,911 tons; this is in addition to the usual large amount treated in local reduction plants. The report shows that 17 gold mines in the district of Temiskaming are equipped with facilities for treating 6660 tons of ore daily.

The president of the McIntyre-Porcupine Gold Mines states officially that the mine is expected to yield upward of \$1,000,000 net profit this year. The general manager declares mill-heads will probably average about \$11 per ton, and costs may amount to about \$5 per ton.

The Canadian Victory Loan for 1919, with an objective of \$300,000,000, is a success. At the time of writing, the objective has been reached; and, with another week to go the total promises to reach at least \$500,000,000.

At a meeting held in Toronto on November 7, the shareholders of the Trethewey-Cobalt Co. ratified a by-law authorizing the company to purchase additional shares in the Castle company on a basis of one share of Trethewey for two shares of Castle stock. The motion in the litigation concerning the Bailey-Cobalt mine, which was to have been heard in Toronto on November 5, has been enlarged till November 19. The shareholders of the Gold Reef Mining Co. on November 7 ratified a by-law which authorizes the company to increase its

capital from \$1,000,000 to \$3,000,000. The Beaver Consolidated continues to encounter high-grade ore in the two veins recently opened up.

PORCUPINE.—All the leading mines of this district are increasing production and aiming to take advantage of more favorable economic conditions than have prevailed for some years. The aggregate capacity of the plants already installed in the district is estimated at approximately 6700 tons daily, of which less than half are in operation, treating about 2500 tons per day. It is claimed that the Dome Mines is now producing gold at a lower cost than any other mine in Canada owing to improved facilities for ore-handling. With mill heads averaging about \$8 per ton it is anticipated that the profits will be ample to provide for a 20% dividend rate next year. Preparations are being made to draw ore from stopes opened up on the Dome Extension, foreshadowing the exercise of the option held on that property. W. H. Pritchard, an experienced mining contractor, has been engaged to resume operations on the Big Dyke, the shaft on which is to be put down to the 300-ft. level. At the Clifton-Porcupine three veins are being developed on the first level, which show a good grade of ore. Diamond-drilling on the Gold Reef has shown encouraging results, several veins stated to carry high gold content having been cut at a depth of 70 ft. A discovery of rich ore on the 600-ft. level of the Davidson is reported. Charles A. Randall, formerly manager of the Dome Lake, has been placed in charge of the North Davidson. Satisfactory arrangements for financing the development of the property have been effected.

GOWGANDA.—The Trethewey has been developing the Castle under option for some time. A rich vein 4 in. wide has been encountered on the property. The Trethewey has also taken a long-term option on the Major, including 112 acres underlying Miller lake.

MANITOBA

RICE LAKE.—A transaction which is likely to have an important bearing on the Rice Lake gold district of Manitoba is the purchase by Gordon C. McTavish of the holdings of the estate of the late Angus McDonald, comprising about 80 claims. Mr. McTavish has strong financial backing and exploratory work will be undertaken on a large scale and the value of the district thoroughly tested. The Gold Pan, of which Mr. McTavish is secretary-treasurer, recently engaged J. B. Tyrrell, mining engineer of Toronto, to make a thorough examination of the property. While unable to make a complete investigation owing to water in the shafts he reported that the company was fully warranted in going ahead with development.

SONORA

ORE AT NACAZARI CON. IMPROVING.—NORTH TIGRE HAS COMPLETED NEW MILL.

NACAZARI CONSOLIDATED.—The annual meeting of the Nacozari Consolidated Copper Co. was held in Douglas on November 10. The annual report, which included en-

couraging news regarding the recent discovery of copper-bearing material in the brecciated zone, about 4000 ft. from the portal of the main working tunnel of the property near Pilares, was read. The grade of the ore in the tunnel is increasing constantly, it was stated. The old officers and directors were re-elected. They were John G. Alexander of Douglas, president; Thomas D. East of Trinidad, Colorado, vice-president; B. R. Russell of Douglas, secretary; Roy Hiatt of Douglas, treasurer; George Motz of Douglas, superintendent and director; Reginald C. Heath of Boston, Massachusetts, director; L. Melton Williams of University Park, Iowa, director. A brief outline of company plans for the immediate future is understood to have been given at the meeting but was not made public.

LUZ BLANCO.—Manuel Canez and associates have taken over the Luz Blanco in the Roy mining district, between the North Tigre and Cinco de Mayo and are driving a tunnel to reach the main orebody. Considerable silver ore already has been developed. The mill on the Roy mine, closed down for several weeks in order to obtain necessary parts for a broken gasoline engine, has reopened and is turning out concentrate every day for shipment through Douglas to El Paso. This property is operated by Col. B. A. Packard and associates of Douglas.

NORTH TIGRE.—This property, lying to the north of El Tigre, has just completed the erection of a 50-ton mill, using water concentration in connection with flotation, a process evolved after long study of the ore. Underground development offers little of interest except that two weeks ago the fault in No. 8 tunnel was run through and a body of good silver ore discovered on the other side of it. No announcement as to size or grade carried by this body has been made. No. 8 tunnel is the lowest working of the property at the present time and has a vertical depth of approximately 800 ft. The property employs about 30 men and is under the active management of Frank J. Holmes.

DOS CABESAS.—The Dos Cabezas probably is the most easterly property in Sonora working at the present time, being situated on the western slope of the Sierra Madre mountains, close to the boundary between Sonora and Chihuahua. Although it has been operated for several months under a lease by Millard Haymore, of Douglas, and Frank Whalen, it has not been molested by bandits, but numerous rumors of the proximity of Villistas have kept the workers on edge much of the time and made for lost efficiency. The mine has rich bodies of silver ore and is shipping the product that will carry freight and smelting charges, as well as concentrates from a small mill combining water concentration and flotation processes. The first shipment of concentrates received at the border recently showed a high recovery in the mill. Shipping is done by Bacerac to Agua Prieta, pack trains and wagons being employed.

SAN LUIS.—The San Luis property lying near the Cinco de Mayo is being operated under lease by Douglas interests and a small force now is taking out ore for shipment to the El Paso smelter. It is a silver property.

SUSPENSION OF ASSESSMENT WORK

H. J. R. 241, the text of which was given in our last issue, was signed by the President on November 13 and therefore became a law on that date. This Act suspends the requirements for assessment work during 1919 on unpatented claims of every description, lode, placer, or oil, and sets no limit to the number of claims for which exemption may be asked by the owner. This relieves the situation created by the previous Act, which limited the number of claims that could be exempted to five.

Blank notices of desire to hold mining claims under this Act, which must be filed in and filed before December 31, 1919, in the office where the location notice or certificate is recorded, are being distributed free by the California State Mining Bureau from its main office in the Ferry Bdg., San Francisco, and from its branch offices at Redding, Auburn, and 312 Union League Bdg., Los Angeles.

CALIFORNIA

Auburn.—The Placer Chrome Co. is completing a new concentrating mill at the foot of the gravity tramway from the mine. This eliminates hauling ore by motor-trucks. The old plant is running with one shift and several carloads of concentrate have been shipped recently to Eastern buyers. —Jeffrey & Day have been granted a permit by the California Debris Commission to operate the Lost Cabin hydraulic mine, two miles from Blue Canyon. Equipment has been installed and a test run will be made as soon as sufficient water is available.

Etna Mills.—The Homestake mine, under the ownership of R. S. Taylor and partners, of Yreka, and situated in the Salmon country, has suspended operations for the winter. J. Boyle, Sr., superintendent, and John Allen arrived in Etna Mills today. The snow on Salmon mountain is piling up, the drifts making the roads almost impassable for trucks.

Grass Valley.—The vein of the State Highway mine, south of Grass Valley, was struck in a new place when a shaft was sunk to a depth of only eight or ten feet. A sackful of specimens was taken out, all showing visible gold. The shaft was sunk on the apparent course of the vein at a distance of several hundred feet from the shaft, at a place where there was no outcrop.

Keswick.—The Pittsburg & Mt. Shasta Co. has let contracts for sinking a 500-ft. shaft at the Little Nellie mine. The shaft will be sunk near the end of the 3800-ft. tunnel to develop large bodies of copper ore indicated by diamond-drills. The property adjoins the Mountain Copper holdings and was formerly noted for its gold output.

Meadow Lake.—The shaft of the Excelsior mine is being unwatered under the direction of Peter Bokay, who has erected a plant on the property. The Excelsior has not been worked since 1905, at which time some good ore was extracted. It is now planned to work the mine on a large scale.

San Andreas.—New York capitalists, including Senator Gates and Baldwin Bros., have acquired 800 acres of placer ground near Sheep Ranch, including the Rigney, Cuneo, and Siefert ranches. It is planned to build a reinforced concrete dam to back up the waters of the San Antonio, San

Domingo, Slate, Calaveritas, and Cherokee creeks, and to operate with water from O'Neil creek and storage reservoirs. It is reported \$1,000,000 is to be expended on improvements and equipment.

Soulsbyville.—A 3-ft. shoot of ore assaying around \$75 per ton is reported exposed on the 1800-ft. level of the Black Oak mine. The discovery was made in the north end of the property in virgin territory. Specimens are on display in Sonora. Driving has started both ways on the vein, which is reported to be growing larger.

Sutter Creek.—The Central Eureka Co. has officially announced that \$50,000 is in the treasury after payment of all bills to November 1, and that the physical condition of the mine is the best in its history for many years. It is rumored here that a dividend is contemplated, but this lacks official confirmation. It is officially stated that splendid ore has been opened in the main workings on the lower levels, and that development of new territory is being vigorously continued. The entire plant is now operating.

Volcano.—Preparations are being made for resumption of work at the Tom and Dick property after ten years of inactivity. San Francisco people have become interested and good ore is being opened. —R. W. Garrity of San Francisco has acquired the Flat Iron property, which has been operated steadily three years.

COLORADO

Cripple Creek.—Mine operators are advised that treatment soon will be resumed at the Colorado Springs mill of the Golden Cycle Mining & Reduction Co., and although there has been little falling off in shipments to date, operators are relieved to hear that settlements will again be prompt. This particularly encourages the small operator, who is dependent upon the returns for his payroll. The November production, however, will necessarily be light, through the temporary closing down of the mill. The Independence mill of the Portland company, treating low-grade mine and dump ores, is electrically operated and the tonnage treated will be normal.

Leadville.—Jesse F. McDonald, superintendent for The Down Town Mines Co., is employing every available miner, exploring undeveloped territory in the search for new ore-bodies. The work is at present confined to the Down Town basin and the Penrose mine, where ore streaks are being followed and are expected to lead to large ore-bodies. The Penrose continues shipping, but the production has fallen to about 50% of the output of the corresponding period of 1918. Large bodies of silver, lead, copper, iron, manganese, carbonate of zinc, and a sulphide conglomerate have all been found in large ore-bodies in the Penrose, and the discovery of new ore-bodies in this territory would cause little surprise to local operators.

IDAHO

Coeur d'Alene. The Western Union Mining Co., operating in the Evolution mining district, three miles north-west of Wallace, has accumulated another carload of ore which it is expected to ship in a few days. The first carload was shipped a few weeks ago. It was composed of 35 tons of lead-silver ore, for which \$2885 net was received. This ore

was removed in the course of development. The body from which it was taken is 8 to 30 in. wide and composed chiefly of clean ore. The quantity of milling ore is small. The shoot has been followed by a drift for 175 ft. at a depth of 1200 ft. The company expects to begin the shipment of ore soon at the rate of two carloads monthly.

A report of the Marsh Mines Consolidated, just issued, tells of the discovery of the Russell vein in the leased portion of its holdings. The report claims that the Marsh has an extension of the famous Tiger Poorman vein, which has yielded millions of dollars, and concludes with the statement that "in addition to the information contained herein another situation has developed recently that may add materially to the value of the company property". The lease of the Marsh on the Russell claim lacks nearly seven years of expiration. According to rumors in general circulation the Russell vein has been yielding a large tonnage of rich lead-silver ore to the Hecla Mining Co. It is averred that the Marsh lays claim to the apex of this vein and to all of the ores removed.

NEVADA

Reno.—The following letter has been received from H. M. Rives, secretary of the Nevada Mine Operators' Association:

"An erroneous impression prevails that wages have been increased in the Tonopah and Divide districts. This is incorrect, the wage-scale existing on August 1 remaining unchanged. Tonopah and Divide operators have granted a bonus of 50c. per day for each occupation, to prevail until a commissary is established. It is expected that this will function within sixty days, after which the bonus will be withdrawn.

"Because injury may result from the circulation of rumors that the Tonopah and Divide wage-scale has been increased, the mine operators' association of those districts have requested that you be informed of the facts. Copies of the agreement entered into between employers and employees and a letter transmitted by the Tonopah and Divide Mine Operators' Association to its members are enclosed."

The letter from the Tonopah and Divide Mine Operators' Association to its members is in part as follows:

"It is the opinion of the Executive Committee that two checks should be issued to each employee, one check covering the regular payment of so many days' labor at a certain rate, and the other check covering so many shifts' bonus at 50c. per shift. It is also suggested by the Executive Committee that the bonus check be plainly marked on the face thereof, so there will be no misunderstanding about same. A good many of the companies are making settlements at this time for the retroactive feature of the agreement up to November 1. The 50-cent bonus from that time on will be paid by separate check on the regular pay-days."

The Agreement follows in full:

Agreement between Tonopah and Divide Mine Operators' Association and Tonopah Trades Association. Tonopah and Divide Mine and Mill Workers' Organization.

Dated November 7, 1919.

First—The operators agree to establish a commissary within sixty days of the ratification of this agreement, to sell the necessities of life to their employees at cost, plus operating expenses. The employees shall have equal representation on the advisory board whose duty it will be to see that goods are being sold to employees on cost basis and without profit and to act in an advisory capacity with regard to the general policy and operation of the store and to recommend any changes which may in their opinion be made in the interest of harmony and co-operation as between the store and its patrons and for the benefit of employees.

Second—Coal shall be sold and delivered to all employees at cost.

Third—Operators will grant a bonus to all employees of fifty (50c.) per shift retroactive to the time the individual employee returned to work, provided such employee is still on the payroll.

Fourth—At the end of sixty days from the ratification of this agreement a Federal mediator will be called in who shall be instructed and have an agreement with both parties of this agreement to the effect that in case he finds the commissary at that time is functioning fully and delivering all necessities of life at cost, he will so declare and the bonus above mentioned will be withdrawn. Should he find the commissary not functioning fully, he will return each thirty days thereafter until he finds the commissary to be functioning fully and the bonus will be continued in such meantime.

Fifth—Board shall be given to single men at thirty-seven dollars and fifty cents (\$37.50) per month where boarding-houses are now hereafter operated by companies. Goods from the store shall be sold to private boarding-house keepers after arrangement with such boarding-house keepers has been made to the end that they furnish board to employees at \$37.50 per month. This clause to become effective at the time store becomes fully operative and bonus withdrawn.

Sixth—Agreement to be in effect until August 15, 1920.

Tonopah and Divide Mine Operators' Association.

By ALLIENE CASE, Chairman.

ALLEN RIVES, Secretary.

Tonopah and Divide Mine and Mill Workers' Association.

By HENRY R. BREWSTER, Chairman.

W. J. LEARY,

JOHN LEARY,

D. D. McMILLAN,

B. J. BRYNE, President.

Austin.—According to reports received by local mining men, the high-grade Cahill vein has been intersected at a depth of 180 ft. in the Nevada Birch Creek mine. The property lies in the Birch Creek district, 12 miles from Austin. The Cahill Lode Co. is rushing developments on the South Extension group to open the continuation of the Cahill vein, and the tunnel is expected to reach its objective in the near future. From its North Extension property, adjoining the Nevada Birch group on the north, the company is preparing to ship high-grade gold ore to custom plants.

Birch Creek.—The upper tunnel at Nevada Birch Creek has penetrated the Cahill lode for 75 ft. showing quartz and stringers of rich ore. Seams assaying \$50 to \$51,000 are exposed. A second tunnel has been driven 240 ft. and is expected to tap the orebody at a depth of 150 ft. At this point rich ore in commercial quantities is anticipated.——Cahill Lode Co. has started sinking a double-compartment shaft to reach the Cahill vein on the South Extension group beneath the porphyritic capping. The shaft is going down between two points where gold has been found on eroded sections of the property.

Goldfield.—Ore assaying around \$30 per ton is showing in the bottom of the winze at the Cracker Jack, approximately 440 ft. from the surface. North and south drifts from the raise above the cross-cut on the 440-ft. level have opened full faces of \$10 to \$25 ore, with the average running about \$18. Driving the cross-cut has been resumed.

Pioche.—The Stindt-Donahue lease on the Big Five has opened a body of high-grade galena adjacent to the Pitts shaft. The orebody is two feet wide and accompanied by carbonate material of shipping grade. Sinking the Blacksmith Shop shaft from 140 to 200 ft. is progressing. The lessees are planning to ship a carload of ore each week to Utah plants.——Hames Bros. are shipping from their lease on the Currency mine of the Amalgamated Pioche. The ore is largely silver-lead but shows some free gold.——Lee

Battles and A. W. Johnson are shipping from their lease on the Bristol group of the Uvada Copper Company.

Virginia City.—New work in the Consolidated Virginia mine is approaching the old and rich section of the property, which was closed down because of a disastrous fire 30 years ago. The area has never been mined since that time, and is stated to have been yielding high-grade silver-gold ore at the time the fire broke out. A new orebody, eight feet wide and assaying around \$16 per ton in silver, has been uncovered near surface on the Southwest Comstock Extension group. The vein was found near the portal of a new tunnel being driven to cut the Roberts vein, 75 ft. distant. As soon as the vein is tapped a 100-ft. shaft will be sunk on the rich vein and deep development undertaken.

OREGON

Sumpter.—The United Gold Mining Co., operating on the Independence mine, 17 miles south-east of Sumpter, has cut the orebody on the deep tunnel level and drifted upon it in both directions from the cross-cut for a total of several hundred feet, according to Arthur B. Lee, president, Spokane. The mill is being operated on three shifts and is receiving 50 tons of ore daily, which will be the rate until the development of the mine is extended.

BRITISH COLUMBIA

Kaslo.—The Flint mine on the south fork of Kaslo creek has been purchased by Elmer J. Edwards and others of Spokane from James Carter of Kaslo. The new owners expect to ship a car of ore about December 1.

Sandon.—This district, the premier silver-lead camp of the early days, is the most active in the Kootenai, and many believe that its future in the matter of production will eclipse its spectacular past. In the matter of deep development the leading properties of the region illustrate the principles of large-scale mining, and many of the best orebodies now being stoped are in properties that have been longest worked. It is estimated that there are 400 men working in the mines and mills of the district, including the Alamo concentrator. Five mines are producing ore for Clarence Cunningham, the largest individual operator.

Slocan.—Intersecting rich ore in its south drift, in which work was started only three weeks ago, operators of the McAllister mine on the north fork of Carpenter creek have now tapped at depth high-grade orebodies on both sides of the canyon or glacial cut that bisects the property. Some of the ore in the face is said to run 1000 oz. of silver per ton, and averages more than 100 oz. for a width of three feet.

Trail.—Reports from the smelter of the Consolidated Mining & Smelting Co. show new properties coming into the shipping list. In the last 10 days of October 4897 tons of ore was received from 28 mines and prospects, two of which are on the list for the first time this year. The two are the Cavanaugh of Trout lake with 20 tons and the Ten Day Man of Adamont with 16 tons. Five mines in Washington are on the list. They are the Consolidated mines, shipping 35 tons from Clines station in Stevens county; Reardan mines, Clines, 30 tons; Loon Lake Copper, Stevens county, 33 tons; Lone Pine-Surprise, Republic, 63 tons; and Quilp, Republic, 245 tons. Other tonnage is as follows: Centre Star, Rossland, 1422; Josie, Rossland, 845; Duncan, Beavertown, 16; May Reynolds, Nicola, 42; Union, Lynch Creek, 49; Eastmount, Enterprise, 33; Echo, Silverton, 104; Florence Silver, Ainsworth, 186; Queen Ross, Alamo, 43; Ruth, Ainsworth, 57; Rambler-Cariboo, Slocan, 105; Standard, Silverton, 355; Tariff, Ainsworth, 6; Whitewater, Retallack, 59; North Star, Kimberley, 306; Paradise, Atholmer, 89; Monarch, Field, 81; St. Eugene, Moyie, 76; Iron Mask, Kamloops, 128; and Mandy, Le Pas, Manitoba, 406.

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Charles Butters is in New York.

Scott Turner is at Vancouver, B. C.

Robert Nye is at Gilman, Colorado.

Ritaro Hirota will sail from Seattle for Tokyo on November 24.

W. A. Wolf has left Ecuador for an extended visit to the United States.

J. Power Hutchins is at Rome, and will remain in Italy to the end of the year.

W. A. Meloche has returned from Stewart, B. C., and is now at Jerome, Arizona.

Stanly A. Easton, manager for the Bunker Hill & Sullivan Mining Co., was at Butte last week.

Arthur Winslow, of Boston, was in San Francisco this week. He is now at Telluride, Colorado.

Courtenay De Kalb was delayed in Spain and did not sail from Brest to New York until November 15.

A. H. Godbe, president of the Prince Con. M. & S. Co., has returned to Salt Lake City after a trip to New York.

L. S. Cates has returned to his headquarters at Salt Lake City after a visit to the Ray Consolidated properties in Arizona.

E. W. Engelmann, consulting flotation engineer for the Jackling properties, has returned to Salt Lake City from New York.

T. A. Janney, superintendent of the Arthur plant of the Utah Copper Co., has returned to Garfield, Utah, after a month's visit in New York.

Ferdinand P. Egeberg, a distinguished Norwegian engineer, is at Salt Lake City, on his way to Arizona, where he will study methods of flotation.

J. Benjamin Parker, metallurgist, of Salt Lake City, has accepted a position as flotation engineer with the Interstate-Callahán Mining Co. at Wallace, Idaho.

W. Lester Mangum, vice-president of the various Jesse Knight mining interests in the Tintic district, Utah, has returned to Provo, Utah, after an Eastern trip.

D. D. Moffat, consulting engineer of mills for the Jackling porphyry properties, is making an inspection of the Chino- and Ray milling-plants in New Mexico and Arizona.

Wilford Van Waggoner, general manager for the Sunset Mining Co. at Leadore, Idaho, and G. W. Wood, mine engineer for the same company, were at Salt Lake City recently.

H. Lidson Hancock, general manager for the Wallaroo & Moonta company, with headquarters at Adelaide, South Australia, has been visiting mines and metallurgical plants in Utah.

R. N. Hunt, James F. Kemp, Reno Sales, C. K. Leith, Alexander N. Winchell, and Horace Winchell testified for the Utah Consolidated in the case now being heard at Salt Lake City, and A. O. Lawson, Waldemar Lindgren, Albert Burch, O. P. Peterson, and George D. Blood for the Utah-Apex Mining Company.

Alexander H. Smith has returned after three and a half years service with the Canadian Expeditionary Force in France and Belgium. On demobilization he has been placed on the Reserve of Officers with the rank of Major of Engineers. He is at present retained to look after the re-establishment of the disabled and youths that joined the colors before reaching the age of 18. He has started a class of 20 men taking a special course in mining and milling at the Haileybury Mining School, Ontario.

EASTERN METAL MARKET

(By wire from New York)

November 18.—Copper is inactive and weak. Lead is quiet and firm. Zinc is dull and steady.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

MONEY AND EXCHANGE

A. Barton Hepburn, chairman of the advisory board of the Chase National Bank, states that the only possible policy for the restoration of Europe to normal conditions is economy and thrift. Discussing present rates of foreign exchange and some of the difficulties in the way of relieving the difficult situation, he said in part as follows:

"Let me quote Governor Harding of the Federal Reserve Board, who says: 'It is the view of the Federal Reserve Board that the need of Europe is for long credits, and that the situation, therefore, is one which appeals to the investment market.' The federal reserve bank law provides that paper discounted by the Federal Reserve Bank shall not run longer than 90 days, except agricultural paper and paper secured by livestock, which may run six months. It is apparent that the Federal Reserve Bank can afford no relief to Europe under the circumstances. It is equally apparent that banks of discount and deposit in this country, in other words, commercial banks, can afford no relief to Europe. While the law may not limit the length of maturity which they may take, custom, conservatism, and good sound banking do limit their maturities. Anything that they would take for longer maturity periods would not be available for re-discount with the Federal Reserve Bank. Temporary credits may be extended to Europe and are being extended, predicated upon current transactions, which credits are expected to be liquidated within the usual period of the commercial bank transaction.

"Most of the current newspaper comment upon the exchange situation is quite absurd. They want European exchange restored to par. That would involve restoring the depreciated currencies of Italy, France, and England and many other countries to a parity with our currency, which is redeemable in gold. The only way that can be accomplished is to have these nations fund their indebtedness, enter upon a vigorous period of industrial activity and economy, and bring their nations back to the gold standard. That is a Herculean task and will involve many years.

"It would be quite possible to bring about a parity of exchange by foolish investments on the part of America, either through our Government or individually or through banks, which would put off the gold standard and depreciate our currency to a par with that of Europe. No one wants such a result, and yet to follow the advice of those people who are so frequently rushing into print with the insistence that we must loan Europe billions would have no other result. There are individual enterprises in all these European countries worthy of confidence and credit. These will be singled out, the usual credit tests applied, and their wants supplied; and in this way Europe will be financed to the extent that it ought to be.

"The debt of Great Britain is still increasing. Their current taxation does not equal present expenditures. The same is true in an emphasized degree of France and of Italy, and all sorts of financial schemes, ranging from a capital tax to repudiation, will fill the air and make the holders of certain foreign-government securities more or less uneasy for some time to come. This country is confronted, in a modified degree, with the same problems that confront Europe. Money is in strong demand at full rates. There is no surplus of consequence available for use abroad, and inflation seemingly is the only source from which large sums could be made available for financing Europe."

Quotations on November 18 are as follows:

| | | |
|-----------|--------|-------|
| Sterling: | Cable | 4.07% |
| | Demand | 4.07 |
| Francs: | Cable | 9.60 |
| | Demand | 9.58 |
| Lire: | Demand | 11.80 |
| Marks: | Demand | 2.25 |

Eastern Metal Market

New York, November 12.

The markets are dominated by the effect of the coal strike. Though this has been called off, it is not known how soon the miners will again produce coal.

Demand for copper continues light with prices slightly lower.

A fair business has been done in tin. Spot delivery prices are lower because of the end of the longshoremen's strike.

The lead market is firm but quiet and no large demand is reported.

The zinc market is quiet, steady, and slightly higher, though buying is light.

Antimony is a little stronger.

IRON AND STEEL

An early increase in the output of pig-iron and steel is probable as a result of the calling off of the coal strike and the return to work of further large numbers of steel strikers. No cutting down of steel output has resulted from the week of the coal strike. The break in the steel strike has been most marked at Youngstown, Ohio, where workers have returned in larger numbers than at any time since the strike began. In that district 60% of the open-hearth furnaces are operating and 12 out of 25 blast-furnaces. There has been an intensive market for steel-making pig-iron the past week. In Philadelphia 40,000 to 50,000 tons of steel-making iron, largely basic, has been sold at advances of \$3 to \$5 per ton. In the Pittsburgh district sales have been made at a \$2 per ton advance over the March 21 basis. The Pacific Coast shipyards are inquiring for 20,000 to 40,000 tons of plates, shapes, and bars for tank ships to be built there. September exports of iron and steel fell off to 363,000 tons as against 465,000 tons in August. Imports rose to 44,000 tons against 29,000 tons in August.

COPPER

Conditions are practically unchanged. Business is light and it is difficult to arrive at a correct appraisal of the market. All ranges of prices are heard of on the business done or the offers made. Anywhere from 20.50c. to 22.25c., New York, for electrolytic copper, either as offers or sales, are rumored for early delivery. For prompt electrolytic 21c., New York, was offered by sellers on Saturday. The various strikes are interfering with buyers in this market. We quote a fair average of the market as 21.25c., New York, for electrolytic copper for early delivery with Lake at $\frac{1}{4}$ to $\frac{1}{2}$ c. above this. Total sales in October are estimated to have been 125,000,000 lb. of refined copper, with sales for export at about 40,000,000 lb. Japan is still a heavy buyer with England also making sizable purchases of crude copper.

TIN

There has been a moderate business the past week and there is much more optimism. The better feeling is due to two causes: The practical assurance that the coal strike is a failure and also the result of the elections. These events have bolstered up the courage of tin buyers. The fact also that the longshoremen's strike is a matter of the past has been an important factor. It has been believed all the time that the coal strike would fail and the withdrawal of the strike is a bull factor. The better business has been largely in nearby tin. The vessels in the New York harbor having tin aboard are being gradually unloaded and as a result the spot market has fallen. Prices for this position have varied widely on different days, due largely to the inability of the buyer to locate the right sellers. No November 6 early in the day sales were made at 54.50c., with 55.50c. obtained

late on the same day. On November 7 the situation was reversed, 54.75c. having been realized early in the day with 53.75c. the sale price late the same day. The market has been steady since then. We quote the market today at 53.75c., New York, for spot tin, New York. Tin for future shipment from the East is held at about 53.25c. On November 7 a fair business was done in future shipment tin. Slowness in the delivery of cablegrams has interfered with business. Thus far this month 850 tons is reported as the arrivals of which 600 tons came in at Pacific ports. The quantity of tin afloat is reported as 5415 tons.

LEAD

The market has been quiet and steady. In some cases premiums have ruled at St. Louis, but at New York the price of the leading interest has been adhered to. We quote the market at 6.50c., St. Louis, or 6.75c., New York. There have been occasional re-sale lots offered under the market. There is no large inquiry visible and demand is confined to carload lots.

ZINC

The future of this market depends to a considerable extent on the ultimate result of the coal strike embroglio. The market has gradually stiffened until today prime Western for early or nearby delivery is quoted at 7.75c., St. Louis, or 8.10c., New York. The firmer market is explained as due not so much to a heavy demand as to the disinclination of sellers to commit themselves for any position until the skies clear. What buying has appeared has largely proceeded from dealers. The general tone of the market is strong and the feeling optimistic in view of the latest strike developments.

ANTIMONY

The market is a little higher at 8.87 $\frac{1}{2}$ c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

No change is recorded with wholesale lots of virgin metal, 98 to 99% pure, quoted at 32 to 35c., New York, for early delivery.

ORES

Tungsten: The unfavorable factors, the coal and steel strikes and the tariff matter, continue to dominate the situation. Practically no business has been reported and quotations continue nominal at \$7 to \$15 per unit in regular concentrates, depending on the grade, delivery, etc. So far as ascertainable in the absence of any business, the nominal quotation for ferro-tungsten is \$1.25 per lb. of contained tungsten.

Molybdenum: The market continues quiet with almost no inquiry. Quotations are nominal at about 75c. per lb. of MoS₃ in regular concentrates.

Manganese-Iron Alloys: Carload lots of standard American ferro-manganese have sold at \$110, delivered, for delivery this year and into the first quarter, but demand is light. No big business is in sight. British producers are out of the market, supplies of ore in that country being reported low. Spiegeleisen, 19 to 22%, is selling at about \$35, furnace, with demand not heavy. Foreign inquiries continue under negotiation.

Shipments of the U. S. Steel Corporation in October were about 60% of finished mill production capacity. With an unfilled tonnage gain of 188,030 tons, the corporation booked close to 1,000,000 tons in this period.

A Worthy
Addition
to the

MASSCO

Line

Metallurgical Engineers Say:

"The Life of the Sackett Sand Pump Is High Compared to Other Sand Pumps"

The principal reason is the hard semi-steel mixture used for liners. Repeated tests have shown it to outwear high-priced manganese in this service.

A second reason is the fact that the joint of the two-piece liner is *away* from the point of impact of sand as it leaves the impeller. This gives added life to liners.

A third reason is the special *enclosed* type of impeller, well known to be more efficient than the open type.

The Sackett Sand Pump was developed in the San Juan District of Colorado for pumping very hard quartz and rhodonite gangue. It has shown such good wearing

qualities that it has displaced nearly all other centrifugal sand pumps in that district.

Oil is held in bearings and water kept out.

Reversible shafts giving twice the service.

Easily relined.

All parts interchangeable.

Carried in stock in 2 in., 2½ in., 3 in. and 4 in. sizes. Larger sizes, as well as special slow-speed pumps, made to order. It has been found economical to use two smaller pumps rather than one large one.

Parts of Sackett Sand Pump

The Mine and Smelter Supply Company

A Service Station within Reach of You

DENVER
EL PASO

SALT LAKE CITY
NEW YORK

ONE of our local organs of misinformation mentions Karl Marx and identifies him as "a German who is dead". If ever a Banquo spoiled a feast, it is the ghost of Karl Marx that gibbers today at American industry.

IN this issue we publish the address delivered by Mr. George Otis Smith, the Director of the U. S. Geological Survey, before the American Mining Congress at St. Louis. Next week we expect to give our readers the address by Mr. Van H. Manning, Director of the U. S. Bureau of Mines. These gentlemen are well qualified to speak for the mining industry in its national aspect and never do so without giving both information and stimulation to those engaged in the work of winning minerals from the earth.

SEVERAL interesting resolutions were brought before the American Mining Congress. One of them was to place a tax of \$10 per ounce on all gold used in manufactures and arts, this tax to be collected by the Government and paid to the mine operators. We note that fully 60 million dollars worth of gold has been sold by the New York assay-office this year for strictly commercial purposes, as against total sales of the same kind amounting to \$41,000,000 during 1918. A premium for gold exists today and the gentlemen at St. Louis evidently only ask that it be recognized, as it is already in Europe.

OUR 'Discussion' department this week includes a valuable letter on the Horwood process from Mr. William Motherwell, who recently returned from the Kolar gold-field in India. He records his experience with this method of selective flotation in British Columbia and gives just the information that other technical men would like to have. Mr. F. H. Mitchell writes feelingly and bitterly concerning his experience as a claimant under the War Minerals Relief Act and will doubtless find many in the West to sympathize with him. Mr. George McClelland expresses his view concerning State Insurance in California. We do not agree with him, but we are more than willing to give him the opportunity to present his case. The last letter, on the 'Price of Gold', is from Mr. W. D. Pagan, the secretary of the North Star Mines Company.

ACCORDING to the 'New York Times', there were 317 major outbreaks of disorder reported in the Mexican newspapers during 112 days, from April 10 to July 31 of this year. Of the 30 States and Territories into which

Mexico is divided, all except Lower California contributed to this orgy of violence and bloodshed. Out of the total, 272 were ascribed to the activities of various factions in rebellion against the Carranza government, 15 to organized banditry, and 15 to the lawlessness of police and military officials. During the same period 72 trains were looted, dynamited, or burned, besides the stations that were attacked and the tracks that were destroyed. Thirty-one towns were raided. These figures give some idea of the conditions prevailing in Mexico. At the present moment the Jenkins affair has created something that is more than a diplomatic crisis. The shooting, after capture, of Felipe Angeles would remove one of the few interesting personalities of the Mexican arena. It appears that he has not been shot as yet, but technically a court martial will be justified in ordering the extreme penalty. How long must we endure the disorderly and unsavory performances in our backyard?

FOREIGN EXCHANGE continues to decline seriously, the extreme weakness that brought the English pound close to the four-dollar mark, with continental rates approaching collapse, being given as one of the causes for the recent break on the New York Stock Exchange. This weakness is having a serious effect on our foreign trade, to appreciate which it is only necessary to realize that with the mark at 2.40 cents Germany would have to pay, in effect, \$10 per dozen for eggs bought in this country. No tariff could be so effective in preventing foreign countries from buying here. The remedy that has been generally accepted has been that the United States should extend long-term credits to the European nations, on a scale that would permit them to make purchases in this country in proportion to their needs. There has been considerable agitation by exporters to this end, and current newspaper comment has reinforced their stand. Now comes Mr. A. Barton Hepburn, chairman of the advisory board of the Chase National Bank, who says that this idea is based on a false hypothesis. He states, in substance, that for the United States to loan Europe billions would undoubtedly stabilize foreign exchange, but by depreciating the currency of this country to a par with that of Europe, not by building up European currency to a par with that of this country. Money is in strong demand here at full rates; and without such inflation as would invite disaster there can be no large surplus for use in Europe. The only recourse, says Mr. Hepburn, is for the nations of Europe to "fund their

indebtedness, enter upon a vigorous period of industrial activity and economy, and bring their nations back to the gold standard. That is a Herculean task and will involve many years." This seems true, and it might with equal benefit be applied to the United States, which is letting slip every day, through its orgy of extravagance and demands for less work, the advantageous position in which it was left by the end of the War. We commend Mr. Hepburn's opinions to the thoughtful attention of our readers.

WE have discussed the Treaty and the League of Nations more than once in these columns, so that our views on this deeply important subject are known, and we have no desire to repeat the argument. We venture, however, to record our earnest belief that the failure of the Senate to ratify these solemn agreements, to which our representatives at the Paris Conference placed their signatures, is a calamity for the world and an injury to the United States. The defeat of the Treaty by the Senate is due in part to petty politics, that is, the desire to discipline the President and destroy his work at Paris. In large measure, this opposition to the President's policy springs from his ill-advised letter before the Congressional election of 1918 and his failure to consult with the best men of both our political parties. It is due also to a narrow-minded notion of detaching the United States from international complications in Europe, as if this were not now proved to be impossible. In consequence of the assassination of an Austrian archduke in a Bosnian village we had to send two million soldiers to Europe and spend twenty-five billion dollars in preparing for warfare. No reason exists for believing that we can keep out of the next big war, for, in future, unless some international organization exists for postponement and deliberation, we shall again be drawn, against our will, into the great conflagration. The progress of science has killed our isolation; we are nearer to Europe today than Europe was to England in Napoleon's day. New conditions call for a new adjustment. We have hopes still that the Senate, after adjournment, will take a broader view of the issue and not allow their animosity against the President to commit them to a grand blunder.

EVIDENCE of a revival of British interest in mining speculation multiplies. We note the formation, in London, of an exploration company on a large scale and supported by an unusual array of financial talent. It is called the National Mining Corporation and has a capital of £3,000,000, according to the 'Financial Times'. The directorate includes Mr. Walter McDermott of the Consolidated Mines Selection Company, Mr. J. A. Agnew of the Burma Corporation, Mr. F. A. Govett of the Lake View & Oroya Exploration Company, Mr. F. W. Baker of the Mexican Corporation, Mr. E. S. Christopherson of the Consolidated Gold Fields of South Africa, Mr. B. Kitzinger of the National Bank of South Africa, Mr. H. Strakosch of the Union Corporation, Mr. A. S. Elmore of the Chemical & Metallurgical Corporation, and Mr. H. Guedalla of the Imperial & Foreign Corporation. The

'Financial Times' mentions the fact that Mr. Kitzinger is a naturalized German and Mr. Strakosch a naturalized Austrian. It is expected that Mr. Baker will be managing director, together with Mr. E. Kitson. Two-thirds of the capital has been subscribed by the participating companies, the other third being offered to the public. This aggregation of financial groups is interesting in that it crystallizes the tendency, manifest during the last decade, of a co-operation among the mining groups, with a view to diminishing such competition among them as encourages the over-valuation of the mines offered on the London market. It is questionable whether it will add to the prestige of London as a market for mines, but it will facilitate the raising of money for such as are sold there. We doubt also whether this concentration of enterprise will help the profession; on the contrary, it may, we think, diminish the opportunities of engagement or of retainer open to engineers, by affording them a giant client in lieu of a number of less financial weight. In this country the organization of big corporations, elbowing the smaller ones almost out of existence, has not proved beneficial to the profession. It has created a few over-paid appointments for a small number of successful men and rendered the independent engineer's position increasingly difficult. We think the profession was better off twenty-five years ago when the big corporations were not so dominating and a relatively larger number of clients were available to the mining engineer.

Incorporate the Unions

Among the measures to be taken for preventing the disorder, physical and industrial, inseparable from strikes, it has been suggested that the labor-unions should be compelled to incorporate themselves, in order to justify their reasonable claims to collective bargaining. The proposal is not new; we have advocated it in these pages more than once; more influential persons have done so elsewhere. With the attempt to debar ordinary strikes, that is, to outlaw the concerted decision of the employees not to work on terms that seem unfair, we have no sympathy. The owners of a manufacturing plant retain the 'right' to close their works without consulting their employees; we see no reason why the reciprocal 'right' should not be recognized, provided always that it does not go so far as to bring hardship on the community as a whole, in which case both employer and employee must pause and consider how far their supposed 'rights' trespass on the paramount welfare of society. At present the chief objection to collective bargaining, which is now an established custom, arises from the irresponsibility of the unions, which are mobilized and demobilized to suit the occasion, in cynical disregard of all those sanctities of good faith that are involved in agreements. It does not seem fair that the unions should have the privileges of corporate institutions, namely, recognition as industrial units and the opportunity of collective bargaining, without assuming the legal obligations implicit in corporate organization. At present the

employers' corporation is liable to judgment for damages in case of breaking a contract with its employees; it has property that affords security for the fulfilment of its agreements; it is amenable to the law. On the other hand, the labor organization is here today and gone tomorrow; its leadership is changed according to the exigencies of the industrial dispute; it is in a state of flux, without tangible property or fixed personnel; it represents the extreme phase of irresponsibility, and illustrates completely Thurlow's epigram on the corporation: "It has no soul to be damned and no body to be kicked." This irresponsibility plays into the hands of the disorderly element that is present in most aggregations of men, in boards of directors as well as in labor committees; it detracts from the social recognition for which the union strives; to it is due the lack of confidence that undermines the contracts made between employers and their employees. It creates a one-sided arrangement fatal to industrial stability. Once incorporated, the labor-union would leave the employing corporation no excuse for refusing to bargain with it and both would feel some sense of security in any agreement made between them. Both corporations, that of capital and that of labor, would be alike amenable to the law against conspiring in restraint of trade and both could be made to answer for acts of social sabotage. With the legal recognition of the labor-union and its acceptance of legal responsibilities would come a better understanding, and a larger measure of that respect necessary to the co-operation of labor with capital. Without this legal responsibility, the labor-union is frequently only a conspiracy to hold-up the employer, and, if that fails, to victimize the entire community, instead of being, as it can be, a democratic organization for the maintenance of that economic balance so essential to the stability and prosperity of the industrial organism.

The Burma Mine

One of the great mines of the world is the Bawdwin, the property of the Burma Corporation in the Northern Shan States of Upper Burma. It is interesting to Americans because, among other reasons, it was opened up by Mr. W. J. Loring, of California, for the British engineering firm of Bewick, Moreing & Co., and later developed more intensively and successfully under the direction of Mr. Herbert C. Hoover. The story of this venture illustrates the vicissitudes not uncommon in mining enterprise. In 1904 Mr. M. F. Kindersley organized the Great Eastern Mining Co. in Burma to acquire a group of ancient silver-lead mines and slag-dumps near Lashio, about 50 miles south of the Chinese frontier. The property covered 2496 acres and was held under license from the government of India. In 1906 this company sold its rights to the Burma Mines, Railway & Smelting Co., which was registered in London, after favorable reports had been received from W. A. Freymouth, F. D. Chase, and C. S. Herzig, the first of these engineers representing Sulman & Picard, and the last, Bewick, Moreing & Co. In 1908 the name of the company was changed to Burma

Mines, Limited. At that time there was no immediate intention of working the mine, which consisted of a large open-cut and other old workings half-smothered by the jungle, but only to treat the accumulation of slag left by the Chinese, whose operations went back four centuries. They ceased operations in 1851, at the time of the Mohammedan uprising, after which the Burmese did some work, but not much. An accumulation of 115,000 tons of rich slag was available for smelting, so the first step taken was to erect a lead smelter at Mandalay, 169 miles from Bawdwin. A narrow-gauge railway 50 miles long had to be built to carry the slag to the junction with the Burmese railway system. Smelting began in February 1909, but the operation proved unprofitable on account of the cost and difficulties of transport over a badly-constructed railroad. During that year 5029 tons of lead and 26,398 oz. of silver were produced. In 1910 the smelter treated 18,772 tons of slag, averaging 46% lead and 1.8 oz. silver, together with 500 tons of ore from the mine. Evidently the Chinese discarded the lead, and saved the silver alone. The cost of transport was \$43,007, so that only an operating profit of £3094 was made. At this time a little preliminary work was done at the mine and high-grade ore was found in the old pillars and stopes. It appeared that the Chinese had worked some of the sulphide ore, as well as the carbonate. In 1911 the smelter was moved to Namtu, 12 miles from the mine, and a refinery was added to the plant, so as to sell the lead in the Orient. Exploratory work at the mine was continued. In 1912 the company operated at a loss of £14,911, despite the production of 8564 tons of lead bullion. During 1913 the Chinaman lode was opened up, disclosing a large orebody assaying 20 oz. silver per ton, with 25% lead and 26% zinc. No dividends had been paid up to this time and successive steps had been taken to raise fresh capital, including an issue of £215,000 in 6% debentures, on top of the original capital, £309,993, in ordinary shares. We do not give the figures in dollars, because the rate of exchange today is different and variable. By this time the slag-dumps were becoming exhausted and deeper exploration of the mine was being hindered by an excess of water, so that the driving of a drainage-adit became imperative. The company was in a bad way financially and needed re-organization.

In October 1913 the Burma Corporation acquired the control of the Burma Mines company, and agreed to furnish £50,000 for working capital, this being increased in May 1914 by a share-issue yielding £100,000 more, and an arrangement to provide a further sum of £200,000 if necessary. Much of this money was provided by Mr. R. Tilden Smith, acting under the guidance of Mr. Herbert Hoover, who had formed a highly favorable opinion of the mine, and became chairman of the new company. The share-issue was successful and work proceeded confidently under the guidance of a technical committee consisting of Messrs. R. Gilman Brown, Theodore J. Hoover, A. F. Keene, and E. Heberlein. The drainage-adit, called the Chinaman tunnel, had followed the lode on a level 171 feet below the surface and near the bottom of the old

workings, which reached to 211 feet; it penetrated a large mass of complex sulphide ore, resembling that of Broken Hill in Australia and of the Sullivan mine in British Columbia. The orebody was 500 feet long and $4\frac{1}{2}$ feet wide, assaying 29.6% zinc, 26% lead, and 23.6 oz. silver. A deeper adit, called the Tiger tunnel, was started to cut the lode 490 feet below the Chinaman adit. Some of this complex ore was sold in Europe, pending the erection of a concentration plant; meanwhile the picked lead ore went to the smelter at Namtu. At the end of 1915 Mr. Tilden Smith stated that a total sum exceeding £2,000,000 had been spent in equipment and development, and of this sum one-half had been derived from the smelting operations. It was estimated that 1,154,000 tons of ore was assured, with the prospect of 500,000 tons more for each 100 feet in depth on the ore-shoots then disclosed. The ore assayed £11 to £14 per ton, but it gave a net profit at that time of £2 to £3 only. During the War only selected silver-lead ore was smelted, pending experiments in the treatment of the zinky ore. In the first half of 1915 the company produced monthly 457 tons of refined lead. On September 25, 1916, the Tiger adit reached the lode at 7333 feet from the portal; and in December a silver refinery was completed, all the silver being marketed thenceforth in India.

Early in 1916 Mr. Hoover resigned as chairman, owing to his war work, and in 1918 he resigned from the board of directors. Sir Trevredyn R. Wynne, who had been president of the Indian Railway Board, became chairman, this change coinciding with a loan of £200,000 made by the government of India and an extension of the company's mining lease for 30 years more, at a royalty of $2\frac{1}{2}$ % on 30% of the gross value of the ore as delivered at surface. In 1917 it was decided also to erect a plant in India for the purpose of smelting the zinc ore, and to produce therefrom 30,000 tons of sulphuric acid and 10,000 tons of zinc per annum, this new enterprise to be conducted in association with the celebrated Tata steel works, thereby ensuring an immediate market for the zinc sheets, galvanized iron, and brass. The technical committee was retired, Mr. A. F. Keene being retained as consulting engineer. On June 30, 1917, the assured ore was estimated at 3,793,000 tons, assaying 27.9% lead, 20.7% zinc, 0.5% copper, and 25.7 oz. silver per ton. A concentration plant of 800 tons capacity was purchased in the United States. Tests showed that 65% of the zinc could be recovered in a 45% concentrate. In 1918 Mr. Lawrence Addicks was engaged as consulting engineer; he estimated that by suitable concentration, including flotation, it would be practicable to market 80% of the lead, 70% of the silver, and 45% of the zinc in the ore. On the Tiger adit-level a horizontal area amounting to 23,904 square feet of ore was proved, this ore assaying 34.4% lead, 15.8% zinc, and 29.7 oz. silver. The latest annual report, for 1918, shows total receipts of £1,008,244, against which is set £591,277 for operating expenses in Burma and £139,993 for depreciation, development, general expenses, and other items, leaving £276,973, from which £35,000 is deducted for income-tax and £181,480

is provided for capital expenditure, so that only £60,493 is carried forward as profit. During the year 18,641 tons of lead and 1,970,614 oz. of silver were produced. At the end of 1918 the ore-reserves were stated to be 4,404,000 tons, assaying 26.2% lead, 18.4% zinc, and 24.1 oz. silver. In addition, an orebody in the Shan lode shows 283,000 tons assaying 14.2% lead, 8.7% zinc, 21.6 oz. silver, and 10.2% copper. There is reason to believe that the orebodies northward will be rich in copper. It is noteworthy that the average assays of successive estimates of the ore in this mine show a nearly constant percentage of lead, an increase in silver, and an encouraging decrease in zinc. There is no indication as yet of any impoverishment in depth; on the contrary, the best showing seems to be in the bottom of the mine. The lode follows a zone of fracture in beds of feldspathic grit lying against a foot-wall of rhyolite. No evidence of secondary enrichment has been noted. On the advice of Mr. Addicks, it has been decided to erect at Namtu a new lead-smelting plant capable of producing 60,000 tons of lead and 5,000,000 oz. of silver per annum. Mr. R. G. Hall, formerly in Missouri, is resident manager; he succeeded Mr. C. H. Macnutt, who resigned in 1916 and served with the Engineer Corps of the Canadian army in France. Mr. L. J. Mayreis is manager of the Indian plant. At the annual meeting a reference was made to the intended application of the new Elmore process and to a profit of £11 per ton on the ore by such metallurgical treatment. It is now proposed to form a company—of 18,000,000 shares of 10 rupees—in India to take over the Bawdwin mines, thereby obtaining the further favor of the Indian government, but the exact purpose of the transfer is not made clear and we doubt whether it will increase the confidence of the public in the enterprise, which as yet has not paid a dividend, although the shares have been quoted recently at £11 $\frac{1}{2}$, making the market valuation £11,500,000. The income-tax on dividends is 30% and the profit-tax 80% on profits in excess of 15%. Transfer to India will not diminish taxation; it will only complicate it. Although this enterprise is now 15 years old, it has not yet reached fruition, despite the expenditure of about £3,000,000 in exploration, development, and equipment, besides the application of a vast amount of technical skill, particularly to the metallurgical problem. This, we believe, is now pretty well solved, so that the shareholders should soon receive something more than estimates, statistics, and reports. The proved ore contains 106,291,000 ounces of silver, 1,154,100 tons of lead, 810,200 tons of zinc, and 44,780 tons of copper, the aggregate assay-value of these metal contents reaching a total of more than £100,000,000, out of which a handsome return should be forthcoming to the shareholders, even after the tax-collector has made his raid on the profits and dividends. The lack of information concerning the cost and character of the metallurgical treatment, together with the uncertain incidence of taxation, make it impossible for us to estimate the present value of the mine, but we shall look forward with keen interest to the fruition of this splendid enterprise.

Selective Flotation by the Horwood Process

The Editor:

Sir—I have read with much interest Mr. Heller's very complete description* of his experience with this process, and if anyone deserves success, surely the owners of the Afterthought mine do.

In the course of a discussion, in 'Metallurgical and Chemical Engineering' on 'The Complex Ore Problem' in 1914 I pointed out the financial advantage being gained by the Zinc Corporation in Australia by the use of the Horwood process, and since then I have been looking for an opportunity to demonstrate its possibilities. When in British Columbia in 1916 I found a man with a problem that had remained unsolved for ten years, and, what was more strange for B. C., he was willing to pay for advice.

His mine is really a pyrrhotite-mispickel mine with about 4% of lead, a little zinc, no copper, and no silver. Some years ago a plant was built to recover the zinc by magnetic separation, but it was not a success. The ore is crushed and concentrated by jigs and tables, and the galena shipped to the smelter. The table-middling, which is mostly pyrrhotite and mispickel, carries about 9% zinc in the form of marmatite (black jack), and the problem is to get this zinc into a marketable concentrate at a profit. It cannot be done by tabling, but might be done by flotation or magnetic separation. Among other methods, I tried the Horwood process in the laboratory and found plenty of difficulties in the way, as I have no doubt Mr. Heller and his staff found at the Afterthought. Neither before nor since that time have I heard of any place where the process is being used on this mixture of minerals, so I had nothing to guide me. In the 'Mining and Scientific Press' of December 23, 1916, there is a letter from Leadville stating that at the Wilson mill at Robinson a new process had been installed by William B. Brooks in which the zinc-iron middling is roasted in Dewey roasters, then separated by flotation, but I have no further information about it and do not know whether it was commercially successful and whether it is still in operation.

My chief trouble in British Columbia was, of course, the roasting. The material contained about 40% iron, 9% zinc, and no copper, as compared with 18% iron, 30% zinc, and 6% copper at the Afterthought. It is fairly coarse and requires grinding to make it fit for

flotation, thus differing from magnetic separation. To treat this material by the Horwood process, it should be ground before it is roasted, otherwise in grinding the oxidized surface would be removed and fresh sulphide would be exposed and the pyrrhotite and mispickel would float as well as the blende, yielding a low-grade concentrate unfit for shipping. In actual practice on this material it would be better to grind it in a dry ball-mill with peripheral discharge as used in Australia and at the Golden Cycle mill, in Colorado, to save drying again before roasting; so in the laboratory experiments it was ground in a disc-pulverizer. By using this method there was no chance to add the flotation oil to the ball-mill, so the advantage of doing so was lost.

The material under treatment was roasted in dishes in an ordinary assay-muffle and stirred with a piece of bent wire. It was not easy to stir the material so that all the pyrrhotite and mispickel would get an oxidized, and not merely sulphatized, coating. An ordinary thermometer, reading up to 680°F. was used to take the temperatures. It was found that, to get the best results, the loss of weight in roasting should not exceed 1.5%. The best temperature probably is between 650° and 700°F. It was difficult to ascertain the actual temperature with the apparatus available—the color of the muffle and of the roasted ore being found the best guide—and the temperature was liable to rise suddenly owing to oxidation or 'firing' of one of the minerals present, probably the mispickel, that is, the ore became hotter than the muffle. In roasting an ore or concentrate containing marmatite there is danger of oxidizing the iron constituent of the blende, thereby preventing the floating of the blende. Regarding the difficulty of controlling the temperature during roasting, some interesting experiments were made by roasting the three minerals separately at different temperatures and then testing their floatability. Also by roasting a mixture of the minerals at different temperatures in different proportions to find the point at which a sudden rise in temperature takes place, partly sulphatizing the blende and rendering flotation difficult. Incidentally, it was found that at certain temperatures mispickel and this particular blende become magnetic.

Mr. Heller found that, in treating Afterthought concentrate, the roasting temperature should not exceed 920°F. on the hottest hearth. He found that some copper sulphate was formed during roasting and that it was beneficial in preferential flotation of the blende. Probably ferrous sulphate was also formed. Mr. Heller says that, in preferential flotation, certain oils were used that did not require heat or acid to be added to the solution.

*'The Horwood Process as Applied to the Copper Zinc Ore of the Afterthought Mine', by A. H. Heller, M. & S. P., Aug. 2, 1919.

At the same time I understand, from his description, that flotation actually took place in an acid solution, which probably accounts for the good grade of the zinc-concentrate produced, assuming the blende to be marmatite. With resin-blende, of course, a much higher grade of concentrate can be obtained.

In my case ferrous sulphate or some similar salt was formed, making the flotation solution acid and proving detrimental unless removed or the solution neutralized by alkali. In some tests the roasted ore was washed before flotation, and in others lime, caustic soda, or carbonate of soda was added to the solution. If this were not done, the recovery was poor but the concentrate high-grade. On the other hand, I got some pure blende from the mine, ground it to pass 60-mesh, placed it in a bottle with water, a little oil, and some FeSO_4 and shook it up. Most of the blende floated, even after the quantity of FeSO_4 was largely increased. Of course, it had not been roasted. One gets some apparently contradictory results in experimenting with flotation. Perhaps it was not the FeSO_4 that was detrimental. Anyhow, the addition of NaOH improved the recovery but not the grade of concentrate.

The flotation tests were done in a small machine of the Hoover type of M. S. apparatus. It may be that, as in the case of the Afterthought, better results would be obtained with the Janney type of machine. It was found that there was no advantage in heating the water above 60°F. (The natural temperature of the water in winter is a little above freezing point.) By grading and assaying the tailing from flotation tests it was found that the finest grade contained most zinc. I believe that better results would be obtained in actual practice than in the laboratory, because, in roasting, the temperature and stirring can be regulated better.

Some tests were also made with a combination of magnetic separation and selective flotation, but the technical and commercial results did not seem to be as good as with straight Horwood operations.

I formed the opinion that this was a pretty tough proposition, having such poor material to work on, besides the difficulty of treatment, but in February 1917, I reported to the management that I had been able to obtain an extraction of about 70% of the zinc in the form of a concentrate containing from 33 to 42% zinc without 'cleaning'. The ratio of concentration was about 6:1. I figured that by selling the concentrate to the Anaconda company on the tariff then in force, and with zinc at 8 cents per pound, a small profit could be made. This grade of concentrate would not be acceptable to zinc-distillers but the Anaconda company was using the electrolytic process. As the material from which the concentrate would be made was a waste product, I did not charge any of the cost of mining and milling against it, but merely the cost of drying, grinding, roasting, flotation, freight, and treatment. However, owing to lack of money and for other reasons, the company did not do anything further. During 1917 the owners of the Trail smelter erected a large Horwood plant to deal with the

dense galena-blende-pyrite ore of the Sullivan mine in East Kootenay, and although I understand it is now closed down, it would be interesting to have their experiences. As far as I know, nothing has been published about it.

There are millions of dollars worth of blende, fine galena, and silver minerals in the Slocan and Kootenay lakes and the creeks flowing into them, much of which could have been saved by adopting better metallurgical methods. The government of British Columbia is now talking of erecting a laboratory in which to experiment on these ores. At the same time one must remember that the nearest market for zinc concentrate was, until 1916, a long way off in the United States, and in addition to freight there was import duty to pay to Uncle Sam.

WILLIAM MOTHERWELL.

San Francisco, November 12.

War Minerals Relief

The Editor:

Sir—In your issue of November 1 information is given that the War Minerals Relief Commission has decided 400 out of the 1200 claims for compensation under the War Minerals Relief Act, and the article is concluded with the statement that "precedence is given partly in the order of filing and partly in recognition of the need of the claimant, in accord with the information available".

It is not stated whether all of these 400 claims "decided" have been adjudicated favorably and awards granted on them or whether they have simply been considered and only part of them allowed. Also, the concluding statement is apt to brew false hopes in the breasts of many deserving claimants, so the following facts should be set forth for their information.

The Relief Commission has summarily rejected all claims not having the endorsement of a personal or direct request by some employee of any of the five Government agencies named in the Relief Act and from whom emanated all requests and demands for the production of the war metals. The Commission bases its action in doing this solely upon its own interpretation of the opinion of the Attorney-General in construing the language of the Relief Act.

The language of the Act could not be more clearly couched in the English language when it states that all claimants that produced or prepared to produce any of the war metals "at the request or demand" of the five Government agencies named in the Act are eligible to compensation for their net loss so incurred. The form of these requests or demands, whether personal, published, or written, is immaterial, and it is a well-known fact that the restriction to confine relief under the Act to those that were "personally requested" was thrown out of the Act when it was in conference between committees from the Senate and House of Representatives. And despite the apparent desire to disqualify many of the small and unknown producers from their just benefits under the

Act, the Attorney-General in his opinion did not venture to re-instate such a restriction that had previously been deleted from the Act. But in what appears to be an attempt to befuddle pure English, he stated that the claimant must have been "asked specifically" by some one of the five agencies to produce the war metals in order to receive its benefits.

In view of the many specific requests formulated by different agencies of the Government during the War and issued through the public press, such as food regulations, Liberty Loan sales, the Draft, and innumerable other specific requests, any miner that read or was apprised through the public press of the Government's request for the production of the war metals, and who was qualified by a knowledge of mining methods to fulfill such request, emphatically and unquestionably was in receipt of a specific request, and was in consequence "asked specifically" to attempt to produce the war metals. The accompanying observation of the Attorney-General in his opinion, that no general appeal or solicitation to produce the war metals could be recognized as a basis for compensation for financial loss to the claimants, was utterly superfluous and irrelevant to the facts in the case, since there was not nor could be such a thing as a general appeal or solicitation for the production of the war metals. The requests for their production emanated from specific sources and was a specific request for a specific article. Yet, despite the fact that neither the language of the Relief Act nor the opinion of the Attorney-General holds that a claimant must have received a direct or personal request in order to come within the purview of the Act, the present Relief Commission has arbitrarily and illegally re-introduced that rejected restriction to relief into its administration of the Relief fund and is unlawfully and deliberately despoiling the great mass of small and deserving producers of the war metals.

Under this present reprehensible procedure, the small unknown miner that failed to scrape an acquaintance with some petty official of the five agencies named in the Relief Act, yet who took in good faith the published appeals and requests of the head officials of these same bureaus to produce the war metals and who patriotically expended his meagre funds in searching out and opening up a deposit of these metals in response to his Government's appeal, is to be despoiled, while the large corporation, which had an opportunity to get in touch with some official of the Mining Bureau, the Department of the Interior, or any of the other specified agencies responsible for the production of the war metals, now has a friend at court and is receiving the proper largess.

However unjust and outrageous this procedure, it is being followed without a scruple by the present Relief Commission and the three members of that Commission intend to adhere to their course until the end of the chapter, as is evidenced by the following excerpt from a letter which I recently received from a prominent senator in Washington, a member of the Senate Committee on Mines and Mining, and who is one of the very few that

are making a fight for justice and a square deal to the rejected and despoiled war metal miners. He writes:

"I received this morning [Oct. 15th] a copy of a letter addressed to the Chairman of the [Senate Mines and Mining] Committee, in which it was stated that if the [War Minerals Relief] Commission were permitted to complete their work under the present law, there, no doubt, would be a substantial amount still remaining and unused in this [War Relief] fund. The letter further states that by that time the Commission will have a knowledge of the situation which will, perhaps, enable Congress to establish a more liberal rule of award than that now existing and under which many of the claims now ruled out can receive attention."

Comment on this astounding implied ignorance of the present situation on the part of the Commission had best be expressed in private; it wouldn't look well on the printed page. After completing a trip around the country of several months duration, during which hundreds of cases of the war-metal miners were heard, and thousands of dollars squandered from the Relief fund in endeavoring to ascertain the exact amount by weight or volume or value of the quantity of patriotism that induced these miners to enter into the production of the war metals, this Commission ponderously states that by the time all the favored claimants are paid—and the appropriation seriously depleted—it will have a "knowledge of the situation!" With all the conveniences at its command at that time; with the testimony of hundreds of claimants; with abundant evidences of actual want and physical financial distress unquestionably produced, the Commission signally failed to grasp or acquire that essential "knowledge of the situation" necessary to dispense impartial justice in accordance with the simple instructions of the Act.

The communication to the Chairman of the Senate Mines and Mining Committee blandly intimates that by the time the Commission has worked up to the requisite "knowledge of the situation", it will be in a position to advise Congress just what to do to make things right for the illegally rejected claimants. The insufferable impertinence of such an insinuation can only be grasped when it is known that these outraged and despoiled claimants, through their friends in Washington, for two months past, have had Senate Joint Resolution No. 81 before Congress and only await ratification of the Peace Treaty before asking action on it. The aim and intent of this measure is to assure just compensation under the Relief fund to those whom this Commission has unjustly attempted to exclude from its benefits.

It is plainly evident, however, that the Relief Commission wishes to go ahead with its hog-killing in its own way: Doesn't wish to be bothered by the interference of Congress in behalf of hundreds of miners that are to be ground-sluiced off the premises because they failed to obtain the official pass-word to the family potlach. It is opined, however, that after the great part of the appropriation has been ladled out to the elect, who have passed the bureaucratic muster, been declared orthodox and de-

serving of grace, the Commission will be in a position to give the ostracized insurgent claimants just oodles of "attention". And it may be well to expect little else, since the mantle of insincerity that has shrouded the entire war metals matter since its inception gives but slight assurance that dependence can be placed upon any official's word that a substantial amount of the fund will be left after the Commission's expenses and the favorite awards are deducted therefrom. The insurgents will be invited to have a drink after the pool has been dipped dry.

But it cannot be denied that it certainly is extremely considerate of the Commission to pose as the prospective guide, philosopher, and friend of the despoiled claimants, after the bulk of the Relief fund has been ladled out to claimants that have no more or as much right to reimbursement as they. Very generous indeed is this empty reparation; as yet only vague and unsubstantial as the repudiated promises that led these miners into the production of unprofitable war metals.

F. H. MITCHELL.

Hot Springs, Arkansas, November 8.

State Insurance

The Editor:

Sir—The fairness of the California State Compensation Act as given in your editorial of November 15 makes it look as though little can be rightly thought in criticism of the law and its workings. But you have not written from all standpoints. The law is a travesty here and is considered a rankling sore. I will give you only a few incidents regarding its application that I know.

Mr. Eaton, in obtaining insurance for his men at the Fortuna, subscribed with the Aetna company at nearly 7% of payroll, considering therein that it would be preferable at that rate with the State Board or Bureau of Compensation. He claimed to have had very disagreeable experience with the Bureau regarding his garage men's insurance. His minimum premium was \$200, even at 7%.

One of the factors closing down the Pennsylvania-Carlotta mine about a month ago was the demand of the inspector for the State Bureau causing offsets at every 30 ft. in their ladder-way to the bottom of their 400-ft. shaft. As the order came from the source of their money to fix the shaft to satisfy the inspector, the changes were made costing \$1200. The insurance could be obtained only by first offsetting the ladder-line. I did not hear what they paid.

Last month I began inquiry for information regarding the insurance of my men with the State Bureau at our county-seat, Sonora, and could not get started into it here. Nobody knew where or how to do it here and nobody was a representative of the State Bureau. It seems that nobody can be paid a small per cent for so acting for the State Bureau as is done in Nevada. I was told that nobody in this county is known to have insured with the State Bureau. All the insurance that I could hear of was done with the Aetna company by the largest

mining outfits. I joined the flock. The charge for my policy was at a minimum of 5.85%, which had been reduced from 6% just recently. And I paid \$59.70 as my minimum for three months. This is to be increased by such amount at the end of three months as the resultant of multiplying the total of my payroll for three months by 5.85% shall be found to exceed \$59.70. Think of it! And the only satisfaction possible is to come from comparing with Mr. Eaton's paying \$200 nearly two years ago. In a June number of the 'E. & M. J.', the Nevada rate is given as 2.85% of payroll. The Aetna agent said it was about that same rate here before the State began insurance.

How can a mining employer feel justly treated in having to put up \$59.70 as against a farmer's minimum of \$10? What is the use of talking about a dividend or return of 35% of my rate of 5.85% of payroll as against that previous rate of the Aetna company and the rate in Nevada, and both the latter paying commissions for business?

I overlooked to state that private companies are by duress (so the agent explains) compelled to charge the full rate to us that the State charges.

GEO. E. McCLELLAND.

Sonora, California, November 17.

The 'Price' of Gold

The Editor:

Sir—Academic discussions as to the 'price' of gold and its relation to finance are interesting, but have not been of much practical help to the unfortunate gold miner. The cost of his gold continues to increase, while the price remains the same. It is stated that the value of gold used for commercial and manufacturing purposes in the United States this year will amount to \$60,000,000, probably not much less than the country's total production of gold during 1919. In this case, the cost of the gold remains the same as before the War, while the price to the ultimate buyer of the finished article will, one may assume, be increased. It may not be possible to raise the price of gold when taken by the Government as a basis of money, but it seems unreasonable and inequitable that jewelers and manufacturers should be able to obtain their gold at the same price as formerly, irrespective of the greatly increased cost of production. The standard value of gold as money at present holds down its price as an article of use or luxury, in spite of enormous demand.

New York, November 7.

W. D. PAGAN.

DEPOSITS of chromite have been known in Alaska for several years, but they became of economic interest only in 1917, when the high price of the ore made it possible to mine it commercially at one property. The chromite deposits of present interest in Alaska are at the south-west end of Kenai peninsula. A description of the deposit now mined and a map showing its location are given in a short paper by J. B. Mertie, Jr., published as part of Bulletin 692-D of the U. S. Geological Survey.

Short Cuts in Mine Surveying—II

By DOUGLAS WATERMAN

THE BRUNTON COMPASS. For the sake of convenience and rapid work one should learn to use the Brunton without the aid of the tripod. As the needle is rather sensitive in these instruments, some practice will be necessary before the compass can be held with steadiness in the proper position; but the knack once acquired, bearings can be read quickly and within half a degree.

Hold the compass close to the body with the muscles of the hands and arms relaxed; any tension of the muscles will cause unsteadiness. The cover of the instrument holding the mirror is supported by the base of the thumbs, and moved backward or forward until the reflection of

as fast as the men can walk; the time required in measuring the distance between points being sufficient to allow the instrument-man to determine and record the bearings. If the instrument-man is required to act as 'rear chain', more time is consumed, as new bearings must be taken at each advance of the tape unless the turning-point is some definite object on which a long sight may be taken. A twig stuck in the ground, or a stone placed on line by the 'head chain' will indicate to the one behind the termination of the last measurement. This will enable them to advance together, saving much time.

If the slope of the ground is more than two or three degrees, or if a profile is required, the vertical angle should be measured. This is done by holding the tape stretched tightly at an even height above the ground with the edge uppermost. In this position the sag of the tape is greatly lessened, especially close to the hand. The compass is placed on the edge of the tape, the bubble brought to the centre of the tube, and the inclination read from the clinometer arc.

Compass surveys as usually conducted underground are unreliable owing to local attraction of rails, cars, and tools, but they may be carried out with absolute correctness within the degree of accuracy obtainable from the reading of such an instrument—from one-half to one degree. This is close enough for the purpose of indicating on the mine map the advance in development work, which is traced in pencil on the plan, to be finally inked in and colored after the transit survey is completed.

The following description of the measurement and platting of new development work will serve to illustrate the method employed. Standing at the nearest transit-station a back-sight is taken to the preceding one, and the bearing recorded in the note-book. The survey then proceeds as usual, but in addition, a back-sight is taken from each point in turn and the bearing recorded. In the office the bearing between the two transit-points as given by the compass is layed off on the arm of the protractor. If this bearing is tested with the true bearing as platted on the map, it will generally be found to vary several degrees, depending upon the amount of local attraction. If the arm of the protractor is made to coincide with the line connecting the two transit-points and a line traced along the base of the protractor, a new meridian is established, which will vary from the true meridian by the variation in the compass reading. In practice it is not necessary to draw the north and south

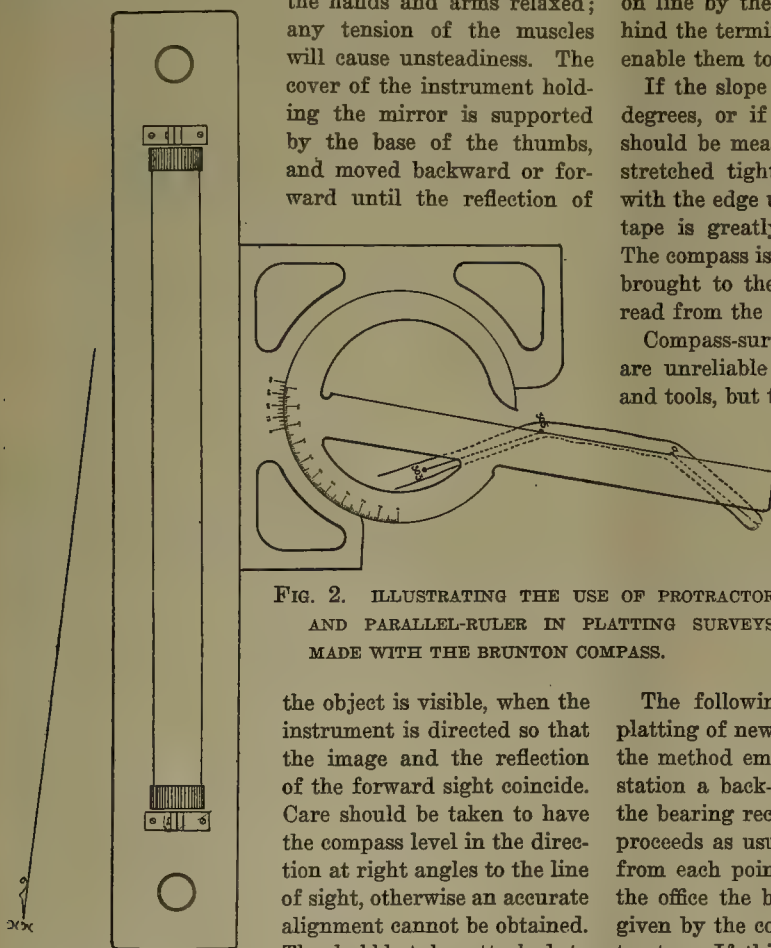

FIG. 2. ILLUSTRATING THE USE OF PROTRACTOR AND PARALLEL-RULER IN PLATTING SURVEYS MADE WITH THE BRUNTON COMPASS.

the object is visible, when the instrument is directed so that the image and the reflection of the forward sight coincide. Care should be taken to have the compass level in the direction at right angles to the line of sight, otherwise an accurate alignment cannot be obtained. The bubble-tube attached to

the clinometer should be placed with its axis at right angles to the line of sight, and the bubble maintained in the centre of the tube while the sight is taken. If the instrument is inclined too much in the other direction, the needle will be thrown out of balance or strike against the cover-glass. A free movement of the needle is all that is required in this case.

With two chain-men a traverse can be covered almost

line if a parallel-ruler is at hand, as this may be used to give the direction of the new meridian by adjusting it against the base of the protractor. The fore-sight is now read from the notes and layed off on the protractor and the bearing traced on the plan, using the new meridian just found.

Fig. 2. is an illustration of the use of the parallel ruler and protractor in platting compass-surveys on the mine plan. A portion of a drift is here shown with two transit-stations, 303 and 305, and a compass point *a*. It is supposed that there was considerable local attraction at the point *a* requiring the employment of the method just described. The position of the parallel ruler with reference to the magnetic north shows the amount of local attraction at this point, but the bearing from *a* to the centre of the face of the drift if layed off from the position of the parallel-ruler will be the true bearing of the line.

To explain the method in a different and perhaps clearer way: if the back-sight at any point gives a bearing of due west and the fore-sight due north, then an angle of 90° has been turned, and it is this angle and not the magnetic bearing that is layed off on the plan.

TRANSIT SURVEYING BY DEFLECTED BEARINGS. The method of deflected bearings, of course, has much to recommend it, compared with the customary practice of carrying the azimuth of the course, although it differs from it only in the manner of recording the deflected angle. By this method the true course is read directly from the instrument, requiring no calculations as in the case of azimuths. The bearing of each course is checked by the bearing of the needle, with which it must agree within reasonable limits. If a mistake has been made it can be discovered and rectified at once. The procedure is as follows:

With the instrument set up over the initial point and carefully leveled, bring the zero of the plate graduations to correspond with the zero of the vernier. Clamp the upper motion and turn the instrument until it points due south. The needle sometimes sticks, so it is well to tap the instrument lightly with the finger to be sure that it has come to rest in the true position. Clamp the lower motion and release the upper.

If the initial point happens to be a station in a previous traverse, the course of the back-sight is determined from the notes and layed off on the vernier, and the upper motion clamped. The back-sight is then taken, and the cross-wire brought to bear on the point by means of the tangent-screw of the lower motion. The object in first pointing the instrument due south is that there may be no mistake in fixing the angle in the proper quadrant, which might occur if the bearing was only a few degrees from one of the cardinal points of the compass. When the reference course is established as either that of a previous traverse or magnetic south, sight on the next point or station and read whichever one of the two verniers show an angle less than 90° , and record the bearing of the course. A glance at the needle will indicate in which quadrant the angle lies.

If one or more side shots are to be taken from any station it is convenient to leave the sight to the next turning-point until the last. The upper motion should be firmly clamped, and the alignment perfected by means of the tangent-screw. Record the rod-reading, bearing, vertical angle, and height of instrument. The instrument may now be moved to the next station; but before doing so it is well to loosen the lower motion in order that the instrument may swing more or less freely, thus avoiding the chance of a movement of the upper plate, which is often caused by the weight of the telescope when in a horizontal position.

Set the instrument over the next turning-point and sight back to the preceding one. Record the rod-reading, magnetic bearing, and vertical angle. Observe the bearing as shown on the plate to be sure that no movement has taken place while carrying and setting up the instrument. A complete check is thus obtained on the observations at each station; this will establish confidence in the accuracy of the survey as it proceeds, affording a valuable incentive to rapid and efficient work.

A comprehensive description of each sight taken should follow in the space provided for that purpose, in order that the notes may be interpreted easily by anyone who may have occasion to re-plot the survey. Sketches of roads, creeks, buildings, and general topographic features will greatly assist in filling in the notes.

Tie in the work by frequent sights on prominent landmarks, and join it to previous surveys wherever possible. Information thus gathered will assist in producing a finished map at some future date.

Unless assisted by a topographer, it is well in hilly country to run out several contour-lines more or less accurately. The rod-man may be directed in placing the rod at a fixed elevation, and a series of sights taken at marked changes in the direction of the contour. These lines established, it is an easy matter to plat the intermediate contours.

STADIA MEASUREMENTS. For the purpose of stadia measurements, the telescope is provided with two additional horizontal cross-wires spaced at equal distances on either side of the central wire. On looking through the telescope at the graduated rod, it will be observed that a certain distance is intercepted by these cross-wires. If it is considered that the lines of sight from the intercepted points on the rod converge at the eye of the observer, then, from the proportionality of similar triangles, the intercept on the rod will vary directly as the distance of the rod from the apex of the triangles. When the ratio of the intercept to the distance is known (usually fixed at 1:100) a ready means is afforded for determining any distance within the range of sight. This is the basis of the method of measurement by stadia.

Owing to the combinations of lenses forming the telescope, this proportion cannot be used directly. The apex of the triangles from which distances are measured must be considered as being in front of the object glass at a distance equal to the focal length of the lens.

In order to obtain the distance of the rod from the

FIG. 3

centre of the instrument, both the focal length of the lens and the distance of the objective from the centre of the instrument must be added to the observed rod-reading. The focal length is constant; the distance of the objective from the centre of the instrument varies slightly as the telescope is adjusted to near or far sights, but, for all practical purposes, it may be considered a

ILLUSTRATING THE OPTICS OF STADIA MEASUREMENTS

constant. The sum of these two distances is known as the 'constant of the instrument' and is designated by the letter c . It is usually one and a half times the focal length, which may be determined closely enough for the purpose by focusing the telescope on a distant object and then measuring the distance from the objective to the capstanheaded screws holding the cross-wires.

So far only horizontal sights have been considered. When inclined sights are taken and the rod held vertically, which is more easily done than at right angles to

the line of sight, other elements are introduced requiring a further modification of the formula in order to obtain the horizontal distance and the difference in elevation.

In their reduced form these formulas are as follows:

$$D = \frac{f}{i} R \cos^2 \alpha + (f + c') \cos \alpha; E = \frac{f}{i} R \frac{\sin 2 \alpha}{2} - (f + c') \sin \alpha$$

D = horizontal distance.

E = difference in elevation.

c' = distance from the centre of the objective to the centre of the instrument.

f = focal length of the lens.

R = reading of the rod.

α = vertical angle.

$(f + c') = c$ = constant of the instrument.

$\frac{fR}{i}$ = ratio of the intercept to the distance (generally 1:100 as being the most convenient).

As an aid to computing these results, tables have been compiled giving the values of $\frac{f}{i} R \cos^2 \alpha$ and $\frac{f}{i} R \frac{\sin 2 \alpha}{2}$ for $R = 100$, and angles from 0° to 30° .

The second term that involves the constant of the instrument may be determined for the particular instrument and added to the result which has been obtained from the table.

Convenient reduction diagrams for horizontal distances are given in Fig. 3 and 4. By their use the computations are reduced from a multiplication of large numbers to a simple subtraction, which in many cases can be performed mentally.

The diagrams were constructed in the following manner: The difference between the unit distance of 100 ft. and its corresponding reduced horizontal distance was obtained by subtraction for each degree of vertical angle. As the difference varies directly as the distance, values corresponding to 700 ft., the extreme distance represented on the diagram, were obtained by multiplying by 7. These values were plotted on the diagrams and connected by straight lines passing through the origin. Then any point on the diagonals represents the difference between the distance as read on the rod, and the reduced horizontal distance for the indicated angle and distance. In these particular diagrams an instrument constant of 0.75, which is common in the lighter instruments, has been taken into account as well; this further simplifies the computations.

Examples in the use of the diagrams: Stadia reading 500 ft., and vertical angle of 10° . Follow down the vertical section-line nearest the intersection of the horizontal line representing 500 ft. with the 10° diagonal and read 14.4 ft.

$500 - 14.4 = 485.6$ ft., which is the reduced horizontal distance required.

By interpolating between the diagonal lines the diagram will serve for any angle, and an accuracy of within a few tenths may be obtained.

In surface surveying there are occasions when accurate measurements of distance and difference in elevation will be required, as, for instance, in laying out buildings, shafts, connections with underground workings, or a claim survey in localities where the possibility of lawsuits with owners of adjoining properties must be considered. Accurate measurements of this character will require the use of the steel tape with transit or level, but for general work the stadia method will prove satisfactory.

The equipment consists of a transit, one or more rods with rod-level for each, plumb-bob, reading-glass, and small hand-axe for cutting brush and driving stakes. For long traverses it is well to have two assistants, one to hold the rod for the back-sight and the other for the fore-sight. In topographic surveys where a number of sights are to be taken from each station, an experienced surveyor can utilize the services of a number of assistants.

It is understood, of course, that all inclined distances must be reduced to horizontal distances in order to be plotted on the map. This requires a reading of the vertical angle in every case. By the method usually

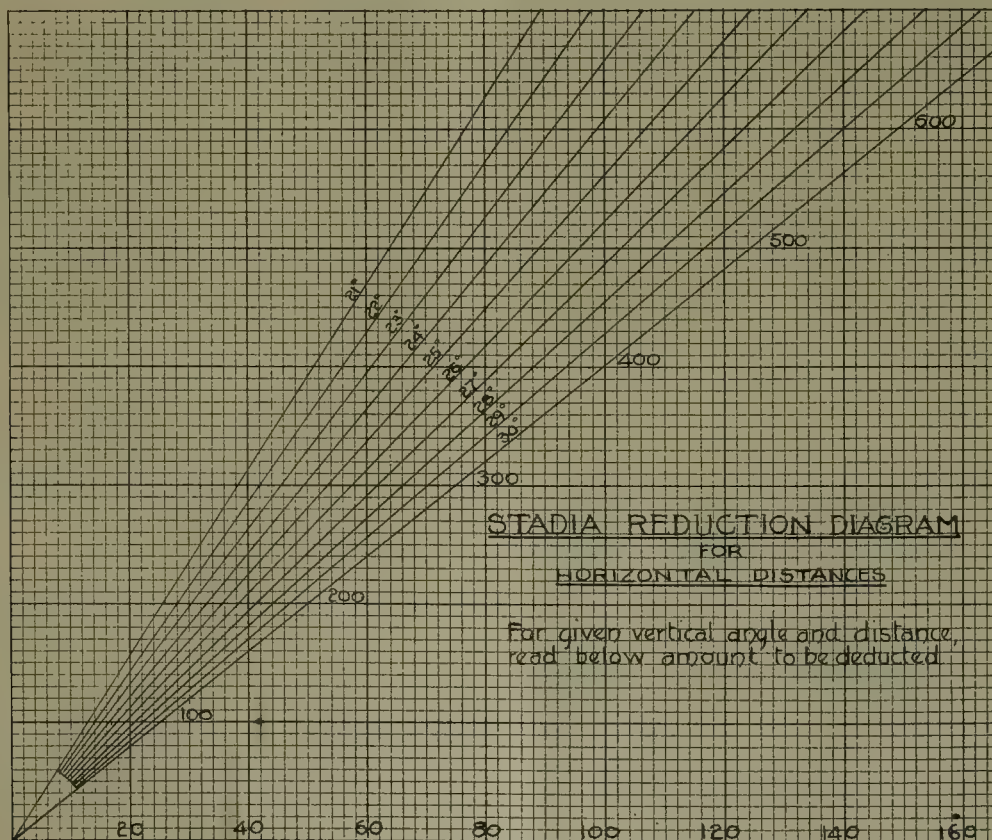

FIG. 4

FIG. 5. STADIA MEASUREMENTS

taught, the line of sight is brought to instrument-height on the rod before reading the angle. This is difficult or impossible at times, owing to intervening brush or immovable objects, which prevent a sight being taken on this part of the rod. By the following method both the horizontal distance and the difference in elevation may be determined if a reading can be taken on any part of the rod intercepted by the extreme or even the two upper cross-wires.

Reference to Fig. 5 will make it clear how this is accomplished.

a = difference in elevation required.

b = height of instrument above or below the intercept of the line of sight on the rod.

c = height of the intercept of the line of sight on the rod.

d = height of instrument.

Then for depressed angles $a = b + c - d$.

And for elevated angles $a = b - c + d$.

Record the readings of the upper and lower cross-wire; the vertical angle; and the height of instrument. The mean of the two stadia-readings will give the height c ; the difference of the two readings will give the slope-distance, from which the height b is calculated, using the stadia-diagram or tables.

By following this method a reading of any part of the rod will serve to give the necessary data for making the reductions for distance and difference in elevation. Often an opening through the trees will allow of a sight being taken without any cutting of the brush. It frequently happens that the rod can be covered by only two of the wires. Where accuracy is not of prime importance, the reading may be taken and the slope-distance determined by doubling the observed intercept on the rod. This also applies to very long sights that are beyond the range of the rod for the two extreme stadia-wires.

As a subtraction is necessary in obtaining the slope-distance, it is convenient wherever possible to bring the lower cross-wire to cover an even footmark, thus simplifying the calculations and lessening the chance of error.

As previously stated, the reduction tables are calculated for a vertical position of the rod. If the rod is not plumb when the reading is taken, accurate results cannot be obtained. A circular or other form of rod-level will greatly assist in holding the rod in this position.

If not provided with such a level, the rod-man still has a means for holding the rod in the correct position. The rod is held by the thumb and fingers of both hands placed well above the centre of gravity and suspended over the point. It will then assume a vertical position which, with care, can be maintained after the rod is lowered to rest on the stake or ground.

While the rod is self-reading for distances varying from 300 to 600 ft., depending upon the power of the telescope, the eyesight of the instrument-man, and the light on the rod, it is often desirable to take longer sights. This can be done with accuracy by using a second target, which, for convenience, should be made so that it can be slipped on and off without sliding in the groove, but capable of being clamped tightly in place. By using both targets, one for each cross-wire, distances of 1000 to 1200 ft. may be determined. The auxiliary target is set at the direction of the transit-man, who either takes the reading when he arrives at the station, or has the assistant call it out to him.

MINE SURVEYING. (1). Setting Permanent Points. Before beginning any serious survey work in or about a mine, two permanent points should be established on the surface, to which present and future lines on the surface and underground can be referred.

Intelligence is required in choosing the position of these points. Although it is desirable to locate one of the points within easy chaining distance of the main entrance to the mine, it should be placed out of the way of future shaft-buildings, timber-yards, or tram-lines.

If the vein is inclined, it is advisable to place the points on the foot-wall side, as the ground over the vein is almost sure to settle after the upper portion is stoped out.

The second point should be placed at some distance from the first—say, 400 or 500 ft.—so that the line joining them may serve as a base-line for triangulation surveys of the property, and in such a position that an unobstructed view may be obtained between the two points.

An excellent 'point' consists of an inch rod firmly set in a low monument of concrete or masonry. The rod may be punch-marked on the top for the accurate centering of the instrument.

Almost the first work of the surveyor would be to determine accurately the horizontal distance and difference in elevation between the two points; also the true bearing

and magnetic bearing. The elevation of the points should be established. This may be an assumed elevation or one referred to a known bench-mark.

Development work underground having reached the stage where a more accurate survey than can be carried with the Brunton is desirable, permanent points are established on the main working levels. These are tied in with permanent surface points by means of suspended wires if the shaft is vertical, or with the top telescope if the shaft is inclined and too steep for sighting with the main telescope.

The permanent points or stations if fixed in the roof of the drift are least liable to be disturbed. Holes are drilled in solid ground, into which tapered wooden plugs are inserted and driven tightly in place. Ordinary staples, such as are used to fasten wire-netting, are driven into the plugs, leaving enough exposed to accommodate the plumb-line. A tag of sheet-zinc on which the number of the station is stamped, is tacked by the side of the staple, two or more nail-holes having been punched for this purpose.

If stopping has been done above the level, or the ground is too soft or fractured to hold a plug, the point will have to be fixed in the floor of the drift. Usually it can be fixed in a sill or tie. A tack or small brad is driven home and surrounded by staples or a ring of tacks to make its position more easily identifiable, and marked with a numbered tag, as in the case of the plug.

In numbering the stations, it is well to follow some system, in order to avoid confusion. If the mine has required the services of an engineer a system will undoubtedly have been established, which it is well to follow unless there is some good reason for making a change. Almost any system will serve if adhered to consistently, but the following is mentioned as having some advantages.

In many mines levels are driven approximately 100 ft. apart, either vertically or on the slope of the vein, in which case it is customary to speak of the levels as the 100-level, 200-level, etc. In all but very extensive workings the number of required transit-stations will not exceed 100. Therefore if the stations are numbered for example 110, and 455, they are immediately identified as being on the first and fourth levels. If the workings lead in both directions from the shaft, by placing all the even numbers on one side, and the odd on the other, the stations will be still further identified, and can be more readily found on the plan of the workings.

It is convenient to have a set of tags for each level prepared in advance of the work. By utilizing one of the nail-holes, the tags can be strung on a wire in numerical order, from which they may be slipped off as required; thus avoiding danger of duplication, which might occur if the tags were numbered only when needed.

In surveying underground a fixed routine should be followed. The helper then knows the sequence of each step in the survey, and no directions on the part of the surveyor are necessary. This is of especial advantage when the survey is carried on in the proximity of active

work, where the noise of machine-drills would effectually drown the voice if verbal directions were attempted. The following routine is recommended as one that economizes the time devoted to the survey.

If the station-point happens to be in the floor of the drift, the transit is set up and adjusted by means of the tripod-legs so that the plumb-bob is brought as nearly as possible over the point, the accurate centring of the instrument being accomplished by loosening the leveling-screws and shifting the instrument on the foot-plate.

If the point is in the roof the instrument is placed so that the punch-mark on the top of the telescope is directly below the suspended plumb-bob, care being taken to have the instrument level, with the level-bubble in the centre of the tube, otherwise the punch-mark will not be in line with the vertical axis of the instrument.

To illuminate the plumb-line the helper holds a piece of tracing-cloth between it and the candle. Against this translucent background the cross-wires are sharply defined, so that a rapid and accurate alignment may be obtained. In drafty places it is sometimes a convenience to be provided with a bottomless cracker-tin over which a piece of tracing-cloth is stretched and fastened. Held inside this contrivance, the candle will be protected from air-currents.

With the vernier at zero a back-sight is taken to the last station-point of the preceding survey, and the lower motion clamped. The helper then comes forward and takes the end of the tape, which he carries to the next station. After attaching the plumb-bob and bringing it to rest, he holds the light for the fore-sight. The upper motion is released and the instrument revolved about its vertical axis, the fore-sight taken, and the horizontal angle recorded in the notes, with the letters *R* or *L* to indicate in which direction the angle has been turned. Some engineers prefer to turn the angles always to the right, so that there can never be any chance for a mistake. The bearing of the needle is also recorded as a check on future calculations. The distance between the plumb-line and the horizontal axis of the instrument is measured with the tape, which is stretched tightly at instrument-height, and the reading taken and recorded to hundredths of a foot.

While the assistant is returning to illuminate the plumb-line for the second back-sight, the engineer measures with a pocket-tape the height of the instrument, in this case the distance of the axis of the instrument below the station-point, indicated by a minus sign in the notes. The 'roof to floor' distance is also measured, as this is needed in carrying the elevations of the floor of the drift, and in drawing cross-sections of the workings.

The instrument is turned, using the lower motion, and the back-sight is taken again. The assistant removes the plumb-bob and again comes forward, this time carrying the reel with him, the engineer retaining the end, and the tape is left stretched along the floor of the drift in line with the forward sight, the most convenient position for measuring the offsets. The forward sight is taken and the double angle recorded. When the engineer has as-

sured himself that the telescope is level, he directs the assistant in sticking a pelet of candle-grease on the plumb-line on a level with the middle cross-wire, thus providing a mark from which to measure 'height of point'.

The engineer now measures the offsets 'Left' and 'Right' with the pocket-tape, using the 100-ft. tape as a base-line, and also as a means of ascertaining the distance along the drift of each measurement. His assistant meanwhile returns for the instrument, which he brings forward for the next set-up. The measurement of the 'height of point' completes the cycle of operations.

(To be Continued)

The Mineral Wealth of Persia

The natural resources of Persia are almost inestimable, and up to the present the great wealth of this ancient country has scarcely been touched. The now famous Anglo-Persian oil-fields are a vivid example of what can be done when the necessary enterprise and capital are forthcoming. The large area over which this company possesses the rights of working contains an almost inexhaustible supply of oil. There is at least one other oil-field in Persia waiting to be exploited. A few Baku experts have known for some time of the existence of oil in the north-eastern part of the country. This district is judged to be exceedingly rich in oil-bearing strata and is situated close to the south-eastern shore of the Caspian Sea.

Beyond any doubt the plateau of Persia is extremely rich in mineral wealth, but the question has been how to work it, owing to the difficulty of transport. In the past reliance has had to be placed on mules and camels, whose loads can not possibly exceed 400 or 500 pounds. This being so, the importation of the necessary heavy machinery has been out of the question, and as a result the greater part of Persia's rich mineral wealth lies dormant.

Seventy miles or so to the north of Isfahan is a disused gold mine that was originally worked by the Persians themselves. The ore was extracted in a crude and antiquated way and then carried to Teheran on the backs of mules, a distance of over 200 miles. There the gold was extracted by some old-fashioned process, and as the profits only covered the expenses the mine was ultimately closed down. With modern methods and up-to-date machinery on the spot such a venture should prove a paying concern.

Gold-dust is found in various parts of Persia, principally in the river beds, but not in any great quantity, with perhaps one exception. It is regularly brought into the Kermanshah bazaar for sale, but from exactly where has so far been kept a secret. Lead and silver are both to be found in payable quantities. Lead is at present being profitably worked by the Persians themselves. The mine is situated in the mountains not far from the Gavkhaneh lake, while some years ago there was a flourishing silver mine in the south-eastern part of Persia

which had to be closed down owing to the hostile attitude of the local tribesmen.

In considering the mineral wealth of the country, copper undoubtedly takes the most important place. Persia is full of copper, but so far it has not attracted foreign capital, because of the import and export difficulties that have had to be contended with in the past. In spite of these many drawbacks, at least one mine is being worked locally. This is situated not far from the Isfahan Yazd road. Reliance has to be placed on charcoal for smelting purposes, but the output of copper is sufficient to justify the mine being worked. A little to the north of Isfahan, in the Natanz mountains, is a large vein of copper. The Kerman district abounds in copper, and in the judgment of a mining engineer who has visited the neighborhood any operations seriously undertaken would easily repay the necessary capital that would need to be invested.

Should financiers be ready to embark on such a venture as the exploitation of Persian mines, the question of both coal and transport would have to be seriously considered. Fortunately coal exists in many parts of the country and is at present being mined in at least two places. Tabriz is supplied with coal from a neighboring mine, and Teheran coal has to a large extent taken the place of wood as fuel. Coal in this latter city is undoubtedly expensive, as the mine from which it is obtained is situated some distance from the city. Besides, the method of extraction is unsatisfactory. A hole is dug in the ground and the coal when reached is thrown to the surface, but when this is no longer practicable the excavation is abandoned and a fresh one started. Naturally the best coal is never reached. Coal is also to be found in close proximity to many of the rich mineral areas. It is known to exist in the Natanz mountains; to the south, west, and east of Isfahan it lies exposed on the surface. The district of Kumisheh is especially rich in this mineral, and quite recently it has been discovered in the Curdish mountains bordering on the Baghdad-Hamadan road.

THE ALASKAN MINING INDUSTRY in 1918 has just been set forth in detail in a report by the U. S. Geological Survey. Regular mining may be said to have begun in Alaska in 1880, when the Juneau gold placers were first exploited. It is estimated that since that time mineral wealth has been produced to the value of more than \$418,000,000. The mineral production of the Territory in 1918 was valued at only \$28,253,961. This output was almost \$12,500,000 less than that for 1917 and was the smallest since 1914. The decrease was chiefly in copper, the production of which fell from 88,783,400 lb., valued at \$24,240,598, in 1917 to 69,224,951 lb., valued at \$17,098,563, in 1918. The reduction in the output of copper was due to shortage of labor and ships. The production of gold decreased from 709,050 oz., valued at \$14,657,353, in 1917 to 458,641 oz., valued at \$9,480,953, in 1918, and was the smallest since 1904. The reduction in the output of gold was due chiefly to curtailment of operations.

FIG. 2

FIG. 4

The Haulage of Heavy Machinery

By H. L. GOODWIN

The accompanying photographs are submitted to illustrate the application of two principles that are of great importance in hauling heavy loads. First, the motive power should be applied as close to the load as possible, and second, the vehicle should have tires of sufficient width to support the load without cutting deeply into the road.

Where horses are used, as is generally the case, the bad effect of having them strung out at some distance from the load lies mainly in the necessity of taking up the slack in the rigging. This is not so important a factor where trained teams, used to working together day by day, are used, but with the scrub teams often of necessity employed in hauling heavy mining machinery it is of considerable moment. The difficulty lies mainly in getting the horses to pull steadily as a unit. When the rigging is so made up that the total tractive effort is applied to the load at several places, say, two or three, this trouble is largely eliminated.

Fig. 1 shows how ten horses and a motor-truck were used in hauling a heavy grinding-mill. Two horses were left on the pole, and the other eight were placed four abreast in the lead. Each of the four-horse units was attached directly to the load by chains from the middle of a long spreader. It was also necessary to attach the ends of the spreaders to the load, so that if the off horses should pull more than the near, for instance, no harm would result. The motor-truck was used with a push-pole in the rear.

Fig. 2 indicates the use of ten horses, six in front of the load, two abreast, and four in the rear, hitched to a push-pole. This is much preferable to having the ten horses strung out, two abreast, in front of the load.

The width of tires on the vehicle is evidently of minor

importance on paved thoroughfares, but on earth roads a great burden is added if the wheels sink into the road. Tires should be at least six inches wide for loads of over five tons. Fig. 3 shows how two sets of 5-in. tired wheels were used with essentially the same effect as though wider-tired trucks had been available. The two pairs of wheels used at each end of the load were placed close together, and so connected with chains that they would 'follow' correctly in going around curves.

Another use of the motor-truck in this work is illustrated in Fig. 4, when it became necessary to resort to tackle in order to get a heavy crusher up a steep grade. Two horses were left on the pole to steer the load, and the truck was trigged in position to serve as an anchor for one end of the tackle. The advantage of having an anchor so readily movable is evident.

Flotation Oils

The following is taken from a business letter:

"Sometime ago I sent you sample pine tar oil. Am sending you by parcel post sample crude wood turpentine. Have one barrel turpentine and 80 gallons pine tar and quote you a flat price of 30c. per gallon on the entire amount. Of the many businesses that have been associated with in 40 years, flotation oil is the limit. You have a good customer and some charcoal burner from Louisiana or Florida will convince him that he has a better product and you have to wait until he uses the car before you can sell him again or some relative of some stockholder has a relative who is in flotation or you have a nice business and have a strike and your business is gone, and am through and am making you a price to clean up."

FIG. 3. SEE OPPOSITE PAGE

The Duty of the Mining Industry

By GEORGE OTIS SMITH

*The realization of America's large heritage in the form of natural resources prompts us to regard ourselves as divinely elected to world-leadership. And indeed no people can more truly or more profitably repeat for their own benefit the words of Milton:

"Accuse not Nature! She hath done her part;
Do thou but thine."

The rank of the United States in the world's mineral industry is shown by the fact that in the last normal year, 1915, our output of the principal mineral commodities constituted about 36% of the world's production, or as much as the six leading nations of Europe together. Here is where figures are more eloquent than adjectives in expressing America's industrial leadership. Yet such endowment of national wealth brings its responsibilities, and the obligation laid upon our industry is measured in a way by the very abundance of the treasure in this greatest storehouse of mineral fuels and ores of the useful metals.

Platitudes about our duty to the Nation do not meet the present need. The test of the individual or the industry is the contribution made to the general welfare. We correctly describe our industry as a producer of basic wealth, but in the policy of the mining industry the dominating note should be not 'wealth' but 'welfare'. In promoting the general well-being our industry is called upon to play no small part. I am going to suggest that we consider the nature of our contribution to the Nation; our particular problems in industrial partnership, the duty of our industry to other business, and the relation between the mining industry and the Government.

During the war period, in addressing a group of my farmer friends in Maine, I told them that the world doesn't owe the farmer a living, but, on the contrary, the farmer owes the world a living. I believe that proposition continues to express the truth under peace conditions, and I would now add my economic and social conviction that the other great productive industry which we men represent here also owes the world a living. Our duty is to provide an adequate supply of the raw materials from which can be fashioned the almost infinite variety of manufactured commodities that the modern world requires. The part, then, of our industry in the cosmic scheme of things is to furnish the world with fuel, with metals, and with all the other mineral raw materials which civilization takes as a matter of course but without which civilization cannot survive.

The exact measure of our contribution to the world,

*An address delivered by the Director of the U. S. Geological Survey before the Mining Congress, at St. Louis, on November 18.

however, is not the dollar. Some of us with a statistical bent love to note the fact that the value of our country's annual mineral production passed the billion-dollar mark in 1899, reached the two-billion mark in 1907, exceeded three billion dollars in 1916, and attained five billions in 1917, and five and a half billions last year. Yet the total value of our annual output is a starting-point for economic self-examination rather than a goal reached that justifies self-glorification. The dollar is a handy measuring stick, but the results it gives need to be verified; quantity and quality of commodities give the truer measure of their usefulness. As a newspaper editor recently put it: "We don't eat dollar-marks; we consume production."

The reported value at the mine-mouth of our coal output may be significant of wages and possible profits to the mine-workers and mine-owners, but it does not measure the heat-units made available for the world's work and comfort. So, if we look behind the camouflage of increased prices, we see that the jump of nearly a billion and a half dollars in 1917 did not mean that our mines contributed an additional 42% to the world's needs. As a matter of fact, of such essential metals as copper, iron, and lead, as well as gold and silver, there was a decreased output, a loss to the world, aggregating more than half a million tons. Again, last year the half-billion dollar increase in market-value expressed not an increase but a decrease in tonnage of such leading items as iron, lead, zinc, gold, and silver. In short, the number of loaded freight-cars that daily leave your plant gives a good measure of your usefulness to the world, irrespective of the size of your daily bank-deposit.

The most gratifying part of the record of American mining and metallurgy is found in the increasing annual output of coal or iron per miner, the steady improvement in recovery of metals from refractory ores, the continued lowering in the grade of copper ore that can be handled at a profit, and the increased safety to life and health of the workers. All this is the result of engineering in the service of man, and in a material way all this tends to increase the tonnage of your output, without increase in price and probably even with lowered costs. So it is that, rather than take the grand totals for our coal and oil and metal expressed in dollars as the true index of our prosperity, we can better claim credit for our industry when prices are low and yet our mines are running full time and our furnaces full blast.

The fact of partnership in industry is now generally recognized and we need discuss only the ways and means for putting into effect this principle of community of interest. Prosperity in any business cannot be one-sided, the public, labor, and capital—all three—must share its

benefits. So, too, an idle industry assesses its losses upon each of these three partners. The coal industry furnishes abundant illustration of this truth; the curve of weekly coal production tells the story of highly irregular operation, and idle plants and idle men are expensive taxes upon the community and the Nation.

The advantages of regular employment accrue alike to labor and capital; it is the year's earnings that really count, whether it is the dollar or the man whose service we thus measure. Now, if we study the country's soft-coal business as a whole, we find a gratifying improvement during the war period in the average number of days of employment—from 195 days in 1914 to the top record of 249 days last year. But these averages for the country unfortunately include low figures for certain States, and usually for the same States year after year, a relation that deserves this comment: wherever the working year is shortest, there dissatisfaction with the conditions of labor is keenest; in other words, where the coal mines have not enough market to keep them running a long working year, there we find labor unrest. For example, the average working days per year for Ohio, Indiana, and Illinois for the last five years have been 176, 196, and 206, respectively, as contrasted with average of 252 days for Alabama, 258 for Virginia, and 292 for New Mexico.

Of course the above relationship is not simple; cause and effect are mixed in this coincidence of short years, labor unrest, and Union strength, and it must be noted that mine-owners as well as mine-workers suffer from every interruption to the full opportunity for earning that comes only with continuous operation. The underlying cause of bad conditions in the coal industry is the seasonal fluctuation in demand, which has resulted in the country being over equipped with coal mines and coal miners. The three States mentioned as favored with longer working years owe this advantage to a market, largely metallurgical and railroad, to the demands of which the mines are fairly well adjusted.

For three months this last spring the coal mines of the country were operated, on an average, for only about 24 hours per week. From coast to coast the reason for lost time was 'no market', something beyond the control of either operator or mine-worker. Here, then, is the greatest branch of our mining industry vitally affected by a widespread malady, the remedy for which lies with the public alone. Arbitration-dictation-legislation cannot cure such deep-seated trouble. Laws cannot make coal mines operate when there is no outlet for their product, but education of the consuming public may accomplish much in bettering the conditions of demand, and we as consumers will do well to remember that the price we pay for coal must in the long run be enough to pay for the idle days of both mines and miners as well as for the days they work. The public interest lies in a longer working year, not in a shorter day or week. Largely on account of the irregular market demand for coal, our mines since the armistice have actually averaged only 30 hours working-time per week; throughout the year there have been

too many mines and too many miners waiting for work. A 30-hour week is the ailment—not the cure.

Reference to this fact of industrial partnership is not complete without mention of the third partner, the public. Whether we belong to the mine-worker or to the mine-owner division of the mining industry, our duty is the same; we must promote the general welfare. A recent editorial in the 'Saturday Evening Post' pointed out that the doctors and the nurses have the right kind of class consciousness; they are conscious that their duty to the whole people takes precedence over their selfish interests.

A true diagnosis of the financial condition of our industry involves book-keeping that states the real economic symptoms. In mining as in all other productive business, production costs should express all the facts, but I am convinced that we have not yet reached that stage in our accounting methods. The annual reports of our largest mining corporations and the studies by the Federal Trade Commission alike fail to tell the whole story in their statement of production costs, which are made to include the wages of labor but not the wages of capital employed. The Federal Trade Commission in its definition of cost specifically excludes interest on investment, but can we do that in the world of realities? Does not the cost of a pound of copper just as truly include its share of the interest due on the bonds and the dividend due on the capital stock actually paid in—that is, wages paid to capital—as it includes the wages paid to the mine-worker or the man in the smelter? Of course, neither payroll should be padded. Do not regard the definition of profit as simply an academic question for college professors to discuss: it is more a matter of fundamental concern to the men who are trying to build up the industry.

In the first place, such terms as 'net earnings', 'profit', 'net income', 'surplus', or 'balance to surplus account', which appear on your financial sheets, are too optimistic in tone when the operating costs do not include any charge on account of the investment. The inference is too easily drawn that this surplus is available for profit-sharing between labor and capital. For example, the Federal Trade Commission report on copper is quoted in newspaper headlines as showing "28% profit in copper", yet in this report the wage to labor is set forth as the first and largest item among the elements of cost, this item alone averaging 5½ cents per pound in 1918, but cost of capital is not included. The report, however, shows that the 85 copper companies discussed would require an average of 3 cents per pound to pay 10% on their actual investment, yet this 3 cents does not appear in the 16 cents of average cost, but instead it forms a part of the 8 cents of so-called 'net profit', which the unwary may regard as the actual difference between price and cost.

In the second place, I fear lest accounting that does not count all the costs may lead us to fail to appreciate the results of American engineering. Our mining engineers, backed up by red-blooded capitalists, are constantly lowering labor costs by increasing the investment

in improved mine equipment. This means replacing the hardest part of labor with machinery—working dollars instead of men—so that your cost-keeping conceals the true state of things, if you pay labor out of so-called ‘costs’ and capital out of so-called ‘profits’. By your improvement in equipment you are subtracting from one side of the account and adding to the other, thus ever making the margin apparently larger than it really is. The great strides in advancing our mining industry have come through large investments in plant, and we must in fairness include a living wage for capital as well as for labor when we figure the cost of winning this or that metal from the low-grade ores, metal that a few years ago not all the labor in the world could have won for the use of mankind.

I have elsewhere suggested that industry must have a conscience, irrespective of the old charge that corporations have no souls. Our mining industry cannot stand right in the eyes of the modern world unless it plays fair with the rest of the business organization. We must try to see the other side of the shield, whatever the transaction with our fellow-men, and I can best illustrate the application of the Golden Rule in economics by citing our relation to the railroads.

As the railroad's largest customer, the mining industry is largely concerned in the solution of the transportation problem now so prominently before the American public. It is plain that adequate service and low rates mean much to the health if not to the very life of our industry, yet even as large buyers of transportation we should not seek preferential rates at the expense of the rest of the public, any more than as sellers of fuel and metal we should be willing to let the Railroad Administration procure its supplies from our mines and furnaces and mills at prices so related to bare cost that the public must make up the difference. You coal-operators know too well how that style of shoe pinches to wish the same kind of narrow policy on the reorganized railroad system. We must allow freight-rates to be determined by facts of transportation cost, rather than by what we claim to be the exigencies of our own business. Even a legislature cannot impose rates, however they may seem calculated to serve public interest, that would deny to the railroad the reasonable reward necessary for its financial and physical upkeep. The Supreme Court has ruled that a State law cannot force a railroad to haul coal at a loss on the supposition that the profits in the wheat traffic will recoup the carrier. So it is that in a spirit of fairness the mining industry ought to help in the adjustment of rates on a basis adequate to revive healthy conditions on our railroads.

Some reference to the relation between the mining industry and the Government may well follow my remarks on business conscience. Standing as I do a little closer to the Government side, I prefer to emphasize the duty of the Government to the industry. I believe in a strong government, strong enough to regulate and even control in the public interest every industry, but above all I believe in a just government. Back in Washington we have

a body of public servants whose desire is to serve the whole people, but most of us are human, and newly acquired power may sometimes affect our vision, so that we make the wrong moves. In its relation to the mining industry the Government needs to be fair, whether the relation is that of mineral landlord or of business investigator or of tax-collector or of purchaser of fuel and metals. Disregard of established equities, ill-advised charges of bad faith, threats of commandeering, or offers of confiscatory terms are no longer warranted in these days when the Government's necessities are no greater than those of other consumers. Indeed, the principle laid down by President Wilson during the War that the Government rate should be the same as the rate to the public should have been followed by every one down the line, whatever his title or insignia of office. Now that we have had time to regain our poise, I think the public servant generally wishes to serve rather than to commandeer.

We in the Government service, however, must realize the necessity of being even more scrupulous in our exercise of power than if we were in private business. I like to keep in mind the words of Judge Severns in the Federal Circuit Court of Appeals:

“It derogates from the dignity and character of the Government to suppose that, formed as it is to secure impartial justice between individuals, it may nevertheless in the conduct of its own affairs, without regard to the principles it represents, perpetrate upon its citizens wrongs which it would promptly condemn if practised by one of them upon another.”

In my opening words I suggested that welfare rather than wealth be the dominating note of our industry. But wealth may be defined as provision for future welfare, inasmuch as it is the surplus beyond present needs. To the present-day problem of industrial unrest, then, what is the answer, except to create a larger surplus? As I analyze the economic situation, surplus of production over consumption can come through decreased consumption or increased production or both, but it cannot come through restricted production or increased consumption or both, and the shortened day of labor surely means both less produced and more consumed. Whether among individuals or among nations the old-fashioned ideas of industry and thrift come nearer the natural law than the new proposition of a five-day week and a six-hour day. No protective tariff can safeguard the home market for industries based on a 30-hour week, nor can our industries expect to win or hold a place in foreign markets on any part-time program, unless there is some international agreement making for universal indolence, and even then we may discover that there can be no return to Garden of Eden conditions of consumption without productive industry. I believe the earliest precedent was a continuing injunction for a six-hour day, and no lower court has since ordered any better rule of action or reversed that divine injunction.

NICKEL ORE from North Carolina has been concentrated magnetically from 0.97% to 3.6% nickel.

Bill to Facilitate Deep Exploration for Copper Deposits

Mr. Carl Hayden, Congressman from Arizona, has introduced a bill, H. R. 10433, to provide for the disposal of public lands in Arizona, New Mexico, Nevada, and Utah containing deep deposits of copper ore. The legislation proposed by the Hayden bill is designed to meet and deal with a condition to which the existing Federal mining laws are not applicable.

The important copper deposits in the States mentioned do not occur in technical 'vein' or 'lode' formation, but in extensive low-grade bodies, usually underlying a heavy overburden of wash, conglomerate, or non-mineral-bearing formation. To discover such underlying deposits, deep and expensive drilling or shaft-sinking is necessary, requiring months, and even years, for its accomplishment. Under the existing law a discovery in such a drill-hole or shaft could serve to validate, and vest possessory title to, only one claim, 1500 by 600 ft., or an area of only about 20 acres, which is insufficient to justify the great outlay involved.

In the past the mining communities have attempted to meet the conditions by locating claims and doing annual assessment work in the overburden. Such claims, in most instances unsupported by any semblance of discovery, have been recognized as property and bought and sold as such, but, generally speaking, the ground has remained undeveloped.

In many instances meagre surface showings, not connected with the underlying deposits, have been claimed as discoveries and even made the basis of patent proceedings. In the early days the Land Department did not examine critically into the matter of discovery unless the question was raised by protest or contest, and large numbers of such claims were patented. This was the case at Bisbee, where the ore-formation occurs at a depth of 1000 ft. or more. In later years the Department has established the practice of requiring a detailed showing as to the character and quality of discovery claimed and of making, through its field-service, an investigation on the ground. As a result, the Department has been confronted with the question as to whether inconsequential mineral showings in the overburden could be accepted as sufficient to constitute discovery, as in the case of the Rough Rider and other claims that were finally patented because it was felt that the previous patenting of similar claims in the vicinity had established a rule of property.

But, generally speaking, lands of the character contemplated by the proposed legislation cannot now be patented unless discoveries are made by deep drilling or shaft-sinking. On the other hand, large areas of such land were in the early days patented under the non-mineral laws, under the rule that land could not be classified as mineral in character, or patented as a mining claim, unless mineral had been actually disclosed. In recent years, however, the Department has adopted the rule

that, through geological deduction as to underlying deposits, land may be classified as known mineral in character, and now declines to patent such lands under the non-mineral laws.

There are thus large areas of land in the four States mentioned which the Land Department recognizes as being mineral in character, but which remain undeveloped because title thereto cannot be acquired under the present mining law.

To justify the expense of exploration by drilling or sinking shafts to a great depth, as well as the large outlay in working-shafts, machinery, and equipment for actual mining operations, it is necessary that a reasonably large acreage be acquired or controlled. To operate on the scale required, not only are extensive orebodies requisite, but a large area of surface is also needed for reduction plants, tailing-dumps, etc. The proposed legislation is designed to encourage the exploration and development of such lands by giving to any one who will undertake deep exploration the right to control and acquire an area of not to exceed 1280 acres (which is about the minimum area now held by any of the large porphyry-copper mining companies) upon conditions carefully designed to prevent abuse of the privilege.

The text of the bill follows:

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled. That the Secretary of the Interior is hereby authorized and directed, under such rules and regulations as he may prescribe, to issue to citizens of the United States, or to any association of such persons, or to any corporation organized under the laws of the United States or any State or Territory thereof, prospecting permits which shall give the exclusive right for a period of three years to prospect for deposits of copper in rock in place underlying an overburden of wash, conglomerate, or non-mineral-bearing formation, in tracts of land in the States of Arizona, New Mexico, Nevada, or Utah, belonging to the United States, containing one thousand two hundred and eighty acres or less, upon condition that the person, association, or corporation receiving any such permit shall begin operations within one year from the date of the permit and shall within two years from and after the date of the permit drill one or more test holes, or sink one or more test shafts, to a depth of not less than five hundred feet, unless a deposit of copper be sooner discovered, and shall within three years from and after the date of the permit drill a test hole or holes or sink a test shaft or shafts to an aggregate depth of not less than fifteen hundred feet, unless a deposit of copper be sooner discovered. And if it appear that the permittee shall have complied with the foregoing requirements but failed to discover any deposit of copper, upon application therefor such permit shall be extended for a further period of

three years upon condition that the permittee shall during each year of such extension drill or sink five hundred feet, unless a deposit of copper be sooner discovered; and the Secretary of the Interior may, if he shall find that the permittee has been unable, with the exercise of diligence, to test the land in the time granted by the permit or such extension thereof, extend any such permit for such further time and upon such conditions as he shall prescribe with a view to the exploration of the land embraced in the permit: *Provided*, That a tunnel or drift of length equal to the depth required for a drill hole or test shaft as hereinbefore provided shall be regarded as the equivalent of any such drill hole or test shaft so required.

"SEC. 2. That whether the land sought in any application be surveyed or unsurveyed the applicant shall prior to filing his application for permit locate such land in a reasonably compact form and according to the legal subdivisions of the public-land surveys, if the land be surveyed, or in an approximately square or rectangular form if the land be an unsurveyed tract, the length of which shall not exceed two and one-half times its width. If the applicant shall cause to be erected upon the land for which a permit is sought a monument not less than four feet high at some conspicuous place thereon and shall place a notice in writing on or near such monument, stating that an application for permit will be made within thirty days after date of said notice, the name of the applicant, the date of the notice, and such general description of the land to be covered by such permit by reference to courses and distance from such monument, and such other natural objects and permanent monuments as will reasonably identify the land, stating the amount thereof in acres, he shall during the period of thirty days following such marking and posting be entitled to a preference right over others to a permit for the land so identified: *Provided*, That where lands of the character hereinbefore mentioned have been located and held as mining claims and annual assessment work done thereon as required by law, the locator or holder thereof, or the locator or holder of the prior location thereof in case of conflicting locations, shall have the preference right to a prospecting permit hereunder. The applicant shall within ninety days after receiving the permit mark each of the corners of the tract described in the permit upon the ground with substantial monuments, so that the boundaries can be readily traced on the ground, and shall post in a conspicuous place upon the land a notice that such permit has been granted and a description of the land covered thereby and cause such a permit to be recorded in the office of the recorder of the county in which the lands described in said permit are situated.

"SEC. 3. That upon the discovery of a valuable deposit of copper within the limits of the land embraced in any permit and proof of the expenditure in labor and improvements thereon of not less than a sum equal to \$25 for each acre thereof, and upon the payment to the proper officer of \$5 per acre, the permittee shall be entitled to a patent to such tract of land, to be described by the legal

subdivisions of the public-land survey, if surveyed, or, if unsurveyed, to be surveyed by the Government at the expense of the permittee in accordance with the rules and regulations to be prescribed by the Secretary of the Interior, and the lands patented shall be conformed to and taken in accordance with the legal subdivisions of such survey, and deposits made to cover the expense of surveys shall be deemed appropriated for that purpose, and any excess deposits may be repaid to the person or persons making such deposits or their legal representatives.

"SEC. 4. That this Act shall not apply to any lands in any military or Indian reservation, national park, or national monument, or lands in any coal, oil, gas, or phosphate reserve or withdrawal."

Mineral Explorations in Alaska

Many of the Aleutian Islands, that crescentic line of volcanic isles and islets that stretches westward from Alaska Peninsula toward Asia, bear deposits of sulphur of the type called solfataras. Sulphur claims have been located at three places on these islands and on the peninsula, one of them in the crater of Makushin Volcano, on Unalaska Island. This peak, which is about 6000 ft. high, is capped by perennial snow and ice and bears glaciers on its slopes down to points about 2500 ft. above the sea. The sulphur deposit is the only part of the crater that is permanently free from snow and ice, being kept so by subterranean heat and by the discharge of hot sulphurous vapor, which issues from vents in the rocks with a loud roar. In this crater 10,000 to 15,000 tons of sulphur may be available for mining. Another deposit of sulphur is on Akun Island. It covers 15 to 20 acres and contains about 1200 tons to the acre. Still another is on Stepovak Bay, on the south shore of Alaska Peninsula.

A. G. Maddren, who examined these deposits for the U. S. Geological Survey, examined also the deposits of placer gold in the beach sands on Kodiak Island, where mining has been carried on for 30 years, and where the value of the annual output of gold has ranged from \$3000 to \$10,000. He sketches the geology of the island and describes the beach deposits that contain the gold and their mode of origin, as well as the methods used in mining. Here the sea has done for the gold miner the work that is done inland by streams—it has assorted and concentrated particles of gold, which were derived from the bluffs that border the beach for miles along the island. The storm surf along this coast is powerful enough to move boulders that weigh tons, and the play of the waves concentrates the fine gold in patches that yield good returns to the miner.

Mr. Maddren's reports can be obtained free of charge on application to the Director of the U. S. Geological Survey at Washington, D. C.

THE MINES of Fergus county, Montana, have produced more than \$18,000,000 worth of metals, mostly gold. Gold was first discovered at Yogo in 1870.

FROM OUR OWN CORRESPONDENTS IN THE FIELD

ARIZONA

COPPER STOCKS ACCUMULATING.—REPORT OF THE SALE OF THE COPPER BELLE MINES.

DOUGLAS.—Announcement was made at the offices of the Phelps Dodge Corporation in this city that on or about January 1, 1920, the department heads of the corporation who have been making their headquarters at Bisbee would remove to Douglas. This is a step in the corporation's policy of concentration and retrenchment. The officials included are Ellinwood and Ross in charge of the corporation's legal department, Gerald Sherman, consulting engineer, and McHenry Mosier, consulting geologist. Walter Douglas, president of the Phelps Dodge Corporation, and Arthur James, vice-president, arrived at Douglas November 22 after completing a tour of the properties under their control in the South-West. The next two days were spent in inspecting the Moctezuma Copper Co. holdings at Nacozari. Copper men generally feel pessimistic about the immediate future of the industry, as even at the present rate of curtailment the copper stocks of the various companies are increasing rapidly. Little or no copper is being sold and huge sums are being tied up each month in copper bullion without hope of sales in the immediate future. The failure of the peace treaty to be passed by the Senate caused bitter disappointment in mining circles of the South-West, as the copper companies are barred from making sales to the Central Powers. At the same time the rate of exchange prevents large transactions with either England or France. As far as can be learned there is no immediate intention of further curtailment either in production or force, but all the companies are 'cutting every corner'. Despite the fact that the only sales made recently have been at 18 and 19 cents, wages continue on the basis of 24 cents.

GLEESON.—A definite report, as yet unconfirmed, is that the Copper Belle mines, owned by the Shannon Copper Co., have been sold to the Calumet & Arizona Mining Co. for \$450,000. For the last month engineers have been on the property preparing a report for the C. & A. In a recent interview in Boston, N. L. Amster, president of the Shannon company, was quoted as considering that the Gleeson mine had great possibilities, but that it might be sold. At that time the deal with C. & A. is believed to have been on. It is understood that the Shannon company will operate its Yeager property. Gordon R. Campbell and Captain Thomas Hoatson are inspecting the properties of the C. & A.

CALIFORNIA

NEWS FROM THE MOTHER LODE.

SUTTER CREEK.—The Old Eureka Mining Co. let a contract on November 11 for sinking its shaft 550 ft. below the 3000-ft. level, at a price of \$29 per foot, contractors to furnish all explosives. This work will sink the shaft to a depth equal to the lowest level of the Central Eureka mine adjoining. Prospecting continues on the 2100-ft. and 3000-ft. levels. Thirty stamps have been dropping at the Central Eureka mine on ore averaging about \$20 per ton during the past two months. The breaking of the 5-ton crown-wheel on the hoist necessitated a few days stoppage of mine work during November, but sufficient ore was in the mill-bins to keep the mill in operation until hoisting could be resumed, and it is expected the November production will equal that of October, which was a banner month. This mine has been operated on assessments for a number of years, but there now seems reason to expect a continuance of the present profitable work. The orebodies on the 3500-ft. and 3700-ft. levels are supplying most of the ore, and it is expected prospect work now under way on the 3300-ft. level will develop the same ore-shoot encountered two months ago on the 3500-ft. level. If so, a large amount of high-grade ore seems assured, for no mining worthy of mention has been done between these levels. Albion S. Howe has been managing the Central Eureka mine during the past year and a half.

JACKSON.—Scarcity of labor slightly handicapped mining operations at the Kennedy mine until recently, but at present 60 stamps of the company's 100-stamp mill are in operation on ore of good grade. Webb Smith is manager. At the Argonaut mine, although the Muldoon shaft remains sealed on account of the fire, operations are being vigorously continued, and the 60-stamp mill is running to capacity on ore from the lowest levels. The workings connecting the Argonaut with the Muldoon mine are effectively sealed, and miners are said to experience no difficulty in working on the Argonaut side.

AMADOR CITY.—As a result of the Keystone Mining Co. having no adequate means of storing its mill tailing, mining operations at that property are practically at a standstill. No ore is being hoisted and only a few men are employed on development work. The company formerly stored its tailing in the same basin as did the Original Amador mine, but the necessity has now arisen for raising the concrete dam if more tailing is to be stored there. This expense seems too great to meet un-

til ore of better grade than that now in sight can be developed.

PLYMOUTH.—The Plymouth Mining Co. has just completed its 2700-ft. station, and cross-cuts will now be extended to pick up the good ore developed on the 2600-ft. level. The shaft has been repaired and sections strengthened by reinforced concrete supports.

MICHIGAN

STATEMENT OF A GERMAN MANUFACTURER REGARDING COPPER PURCHASES.—OUTPUT OF MINES FOR OCTOBER.

HOUGHTON.—Seneca has not yet started to resume sinking on the first Gratiot shaft, recently purchased from the Calumet & Hecla. Securing equipment for the resumption of operations on this property is slow work. Unwatering will commence soon.

A Houghton army captain, while serving in Coblenz, made the acquaintance of a German manufacturer, from whom he recently received a letter which sheds some light on the copper metal situation. Translated freely the letter reads: "You will be interested to know that I have just completed arrangements for financing the shipments of copper which I need to get my business back on a normal basis again. It was arranged through my New York connections. I believe the War did small manufacturers like us a good turn. We have plenty of men again and many women willing to work full time at reasonable pay. So there is no trouble about labor. I went over the copper situation carefully before buying. There is no copper in Germany anywhere. The old time German copper trust that operated at Hamburg and Frankfurt is wiped out. It never could live without the Imperial Government back of it anyway. It controlled the product of Bohemia and all the imports from America. Now we buy direct from America. The German business-man has only to arrange to finance his affairs. I think I got in ahead of my competitors. I bought my copper at 21c., and that is Michigan copper too."

The Quincy company is erecting its new hoisting plant at No. 2 shaft. The contract for this enormous hoist was let in May 1917. It now is being set up, practically all the parts having been delivered from the Milwaukee shops of the Nordberg plant. The plant will have the world's record for one continuous hoist.

Hancock now has 10 machines at work. Two cross-cuts are being driven, one at the 44th and one at the 49th level, and the other drills are working in drifts on the east branches of the Pewabic lode. The management hopes to be able to open the formation on a larger scale so that it may take advantage of a change for the better in the metal market.

The production figures for the copper mines of Lake Superior for the month of October show substantial increases in the Calumet & Hecla group of mines, but falling off or just about even figures for the other mines. The most sensational increase in output was made in the Calumet & Hecla mine itself, which increased its ore output to 212,543 tons in October as compared with 180,017 tons in September, and increased its refined output of

copper by 800,119 lb. Ahmeek, one of the Calumet group of subsidiaries, made an increase of 291,155 lb. of copper, an increase in ore tonnage from 61,720 to 68,000 tons, and a pronounced betterment in the quality of the ore, which increased more than 2 lb. per ton to 24.56 lb. Another mine of the Calumet & Hecla management that is coming rapidly to the front and making good the predictions of its friends is the Isle Royale, for a long time looked upon as a weak sister of this group, and always considered a low-grade property whose only hope rested in large output. In October this mine mined copper which ran 19.18 lb. per ton. White Pine entered the ranks of producers.

| Mine | Ore tonnage | Lb. per ton | | Refined | |
|-----------------|----------------|-------------|-------|-----------|-----------|
| | | Oct. | Sept. | Oct. | Sept. |
| Ahmeek | 68,000 | 24.56 | 22.3 | 1,670,142 | 1,378,987 |

MISSOURI

REVIEW OF THE JOPLIN DISTRICT FOR THE MONTH OF OCTOBER.

The month of October closed with shipments approximating 35,346 tons of zinc blende, with a valuation of \$1,568,473. Calamine shipments approximated 1374 tons with a valuation of \$39,507. The tonnage averaged 8836 tons weekly for shipments of zinc blende and 343 tons for calamine, or a total of slightly in excess of 9000 tons. This is a remarkable showing, due to the fact that the month opened with a severe shortage of cars and with small hope held out for any relief in the situation. However, by using broken-down cars that had been repaired by the shippers themselves, supplemented by empty coal-cars going through the district to the east, and by using trucks and teams for hauling lead, thus releasing cars for shipping zinc, a serious situation was bridged over. While no surplus stocks have been moved, and there is no hope of moving them for weeks to come, the shipments have taken care of the immediate necessities of the field and have made it possible to keep men employed who would otherwise have been out of work.

There has been very little advance in the price paid for zinc ores, the price ranging from \$42.50 to \$47.50 for zinc blende and from \$25 to \$30 for calamine. The average price paid for zinc blende for the month was \$44.37, and for calamine \$28.75. The month opened with a surplus stock of 30,000 tons and closed with 29,000, this being the unsold stocks in the bins of the ore producers. The ore buyers have purchased stocks in the field amounting to approximately 35,000 tons.

Shipments of lead ore have been good throughout the

month, aggregating 5685 tons and averaging 1421 tons weekly. Prices have been good, ranging from \$75 to \$85, the latter week seeing the price jump to \$85. Cars for shipping have not been available, but local smelters have hauled the ore by trucks and teams to their plants so far as it was possible to do so, and have been able to keep their plants going and relieve the condition at the mines. By this method the surplus stocks have been wiped out of the district, and assistance given to the handling of zinc ores. The average price paid for lead ore was \$79.65.

Labor conditions have been growing better and today there is an ample supply of labor in the district. However, producing conditions are anything but favorable, due to the coal strike which threatens to cut off all available supply of fuel for steam-plants, and will in a very short time cut off the electric power, as the major portion of it is generated by steam-plants.

The feature of the district's development for the past

ning through Racine, Seneca, and on down into the State of Oklahoma. There have been a number of prospects along this fault, but all of them have been of shallow extent and of mediocre richness. The new discovery at a considerable depth for this field is therefore taken to mean that there are possibilities of mining along this entire stretch of broken structure, and mining operators in the district are securing leases and there will probably ensue a large prospecting campaign on the Missouri side of the line.

NEVADA

GENERAL NEWS OF THE STATE.

ARROWHEAD.—The east drift on the 100-ft. level, of the Arrowhead is 45 ft. long and the face is in ore 4 ft. wide and assaying from \$150 to \$200 per ton. The winze from this drift is 30 ft. deep, with 4 ft. of ruby silver ore assay-

A GLIMPSE OF THE GREEN HORN MOUNTAIN MINE, SHASTA COUNTY, CALIFORNIA

month is centred in the discovery of a new district for zinc and lead mining. This is south of Joplin, approximately six miles, where a wildcat drill-hole searching for water discovered an entirely new ore horizon below the 300-ft. level, which showed a 60-ft. face of zinc ore reported to have assayed over 20% zinc. This discovery has caused great excitement, and a general rush to grab the leases in that part of the country has taken place. The discovery was made upon the land of A. L. Carpenter, of Joplin. The American Zinc, Lead & Smelting Co. immediately secured a lease upon this tract as well as upon a considerable acreage of the surrounding lands, and is about to start a thorough campaign of drilling to test out the ground. The new tract is not a great distance from what was known as the 'Oleson mining camp' south of Spring City, where a good deal of shallow mining was done several years ago at an average depth of 60 to 70 ft. At present there is extensive lead mining at the shallow levels and some zinc silicate mining. The discovery is close to or along what is called the Seneca Fault, the only known structural deformation of any noteworthy extent in the Joplin district. This fault strikes south-west from Sturgeon, Missouri, run-

ing \$450 exposed in the bottom. The east drift on the 175-ft., or bottom level, is 120 ft. long and indications are that it is close to the ore-shoot, which rakes in this direction. The west drift on this level is 75 ft. long and it continues to cut seams of good ore of erratic width and value. The ore taken from the east drift on the 100-ft. level and the winze from this level is being saved for shipment to Tonopah, 60 miles distant. A gasoline-driven hoist is in use, replacing the whim formerly used. Other companies preparing to start work are the Arrowhead Bonanza, Arrowhead Extension, Arrowhead Consolidated, Arrowhead Signal, Arrowhead Syndicate, and Arrowhead Annex. The silver in the district occurs principally in sulphide form, with some chloride. The ore is found associated with calcite and quartz in well-defined veins with andesite and dacite-porphphyry walls.

GOLD MOUNTAIN.—The Washington Gold Quartz company, owner of the Randolph group, after prospecting the surface of the claims along the contact, is driving a drift tunnel to prospect the vein. The tunnel is 70 ft. long and, according to J. K. Turner, general manager for the company, it is nearing the intersection of the first cross vein. At 70 ft. the full face assayed \$13. The ore

contains gold, silver, and lead. Preparations are being made to add a second shift of miners.

WEST DIVIDE.—The south drift from the 60-ft. shaft of the West Divide has been driven 30 ft. in ore from 1 to 1½ ft. wide and assaying from \$20 to \$200. The shoot is irregular in size and grade. Shipments will be started from the north drift if satisfactory rates can be secured for transporting the ore from the shaft, to which a road cannot be built economically, to a road recently constructed to within several hundred feet of the shaft. A cross-cut has been started from the face of an old tunnel to cut the vein at a depth of 150 feet.

GOLDFIELD.—Four lessees have shipped from the Florence in the past 10 days 360 tons of ore assaying from \$35 to over \$100 per ton, according to estimates. The Boesch lease in the old Riley block produced 200 tons, the first output from this lease in a long period. Shipments from the Florence Divide lease are irregular. The Florence company employs 12 men, 7 of whom are miners engaged in development work. Twenty-eight men are leasing or are employed by lessees. A vein 4 ft. wide and assaying as high as \$16.40 per ton for this width has been opened in a cross-cut from the main south drift on the 500-ft. level of the Red Hill. The cross-cut was driven west into the foot-wall of the Rogers vein and drifts have been driven short distances in the newly discovered ore-channel, which parallels the Rogers. Samples taken in the north drift at this point assay from \$8 to \$20.80, and in the south drift up to \$7.40. Following agitation by the miners and craftsmen for a new wage-scale, the Goldfield Mine Operators' Association, inactive for several years, recently was re-organized. At a meeting at which practically all the companies were represented the wage-scale and living conditions were discussed with the result that it was decided to bring the influence of the Association to bear on the merchants in an effort to reduce costs. A committee was appointed and held a preliminary discussion of the matter with the merchants. There is no standard scale in the Goldfield district, the wage for miners varying from \$5 to \$6, some of the companies using a bonus system. Wages and living costs are of vital importance at this time in view of the plans of the Development company to treat low-grade ore at a small margin of profit.

CACTUS.—Samuel Eichen, a New York real estate dealer, and Joseph Fynney and Albert H. Cutter, Boston bankers, are at the head of a syndicate that has financed the Cactus Nevada Silver Mines Co. for \$280,000. Cactus is 24 miles east of Goldfield. The Cactus Nevada company was formed by Joseph F. Nenzel, interested in mines at Rochester, Nevada, and in other parts of the State, to take over seven claims owned by E. M. Bailey of Goldfield. The sale was made last May for a price reported to have been \$30,000 cash. Bailey had developed the claims periodically for 15 years, the principal work being two 100-ft. and one 150-ft. shaft. The Cactus Nevada continued one of the 100-ft. shafts to 160 ft., which made it the deepest shaft in the district, and did considerable lateral work. The average width of the vein

at 160 ft. is 25 ft. and the ore is reported to assay \$25 for this width, containing from 90 to 95 parts silver to 1 of gold. The veins are in fissures and the walls are rhyolite and andesite. Three well-defined ore-channels extend through the claims, the principal one for a distance of 3000 ft. Mr. Nenzel, now in New York, is expected to visit Cactus in a short time to start work on a large scale.

UTAH

OPERATIONS OF UTAH COPPER FOR THE THIRD QUARTER.—
NEWS FROM ALTA, EUREKA, AND PARK CITY.

SALT LAKE CITY.—The Utah Copper Co. has released its 46th quarterly report, covering the third quarter of the current year. The production of copper from concentrate was 24,774,761 lb. and from leaching plant precipitates 494,918 lb., making the total output 25,269,769 lb., as compared with 28,046,978 lb. for the second quarter. The Arthur plant treated 1,397,400 dry tons, averaging 1.16% copper, with an average recovery of 76.20%, as compared with 1,242,500 tons for the second quarter, averaging 1.35%, with an indicated extraction of 81.8%. The decrease in output for the third quarter was due to the lower copper content of the ore. The average cost per pound of net copper for the quarter, excluding Federal taxes and without credit for gold and silver content or miscellaneous earnings, was 14.885c., as compared with 11.59c. for the previous quarter. The higher cost is due to the smaller production, and also to the increase in wages, effective July 16. The total net profit for the quarter was \$2,419,512. On September 30 a dividend of \$1.50 per share was paid, or a total of \$2,436,735, resulting in a deficit for the quarter of \$17,223, as compared with a profit of \$215,369 for the second quarter. The earnings for the third quarter are computed at 22.225c. per pound, as against 14.74c. for the previous quarter. The increase in carrying price was due to sales of metal being in excess of production, whereas during the second quarter sales were much less than the output. There was removed from the mine 549,166 cu. yd. of stripping, as against 333,048 cu. yd. for the second quarter. The Bingham & Garfield railway transported an average of 8237 tons of ore per diem and 1712 tons of commercial freight. Since the beginning of dividend disbursements on September 30, 1908, the Utah Copper Co. has paid its stockholders a grand total of \$99,325,988.

ALTA.—Contractors at the Alta Tunnel & Transportation Co.'s property have driven the east drift in the direction of the Prince of Wales workings more than 70 ft. since the beginning of their 200-ft. contract. In doing this work a large amount of milling-ore has been taken out and many small bunches of high-grade uncovered. The drift is still following the hanging wall, and F. V. Bodfish, manager, is confident that it will soon pick up one of the ore-shoots, or chimneys, mined near the surface in the early days by the Prince of Wales Co., and is highly pleased with the rapid progress in the drift.

Connection should be made during December between

the 600-ft. level drift in the Cardiff mine and the Columbus Rexall tunnel, which will give the Cardiff mine an outlet into Little Cottonwood canyon for the shipping of its ore, according to Ezra Thompson, general manager for the Cardiff company. Mr. Thompson states that less than 250 ft. of driving is yet to be done before the connection is made. The work is being expedited by driving on both faces; the crew on the Cardiff side has less than 75 ft. to run and the crew on the Rexall side about 140 ft. before the two drifts will meet. The connection will be of immediate benefit because of the ventilation it will afford the Cardiff, but the adit will not be used as an ore-shipment outlet until next season, as the tunnel will have to be enlarged and considerable preparatory work done in it before it will be in such condition that ore shipments can be trammed through it.

EUREKA.—Ore shipments from the mines of the Tintic

BRITISH COLUMBIA

COMMITTEE TO INVESTIGATE TAXATION OF GOLD MINES.— ACTIVITY IN THE BARKERVILLE DISTRICT.

VANCOUVER.—With the depreciation in the purchasing power of gold the system of taxing the gold mines of the Province has become obsolete and unfair in the judgment of some members of the British Columbia Chamber of Mines. If the gold mining industry is to be maintained, they hold, the fundamental principle in fixing taxes must be the ability of the properties assessed to pay. Owing to the fact that, since taxes last were adjusted, mining costs have practically doubled, a joint committee, representing the B. C. Chamber of Mines, the Canadian Mining Institute, and the mine owners, has been appointed to investigate the matter and submit a report with a view to making whatever representations are thought advis-

Photo by Tune, Goldfield

THE DEVELOPMENT MILL AND THE SLIME POND, GOLDFIELD, NEVADA

district took a leap upward during the week ending November 15, a total of 140 cars being shipped, as compared with 118 for the previous week. The Chief Consolidated, Dragon, Tintic Standard, and Iron Blossom mines almost doubled their output during the second week of November. Of the 140 cars, Chief Consolidated loaded 38; Dragon, 19; Tintic Standard, 18; Iron Blossom, 17; Grand Central, 10; Centennial-Eureka, 9; Eagle & Blue Bell, 6; Colorado, 4; Swansea, 3; Mammoth, 3; Ridge & Valley, 2; Bullion-Beck, 1; Victoria, 1; Eureka-Hill, 1; Laclede, 1; and Sunbeam, 1.

PARK CITY.—Shipments of ore from this district for the week ending November 15 totalled 1616 tons, of which the Ontario Silver furnished 530 tons; the Judge Mining & Smelting 487 tons; the Silver King Coalition 440 tons; and the Daly West 159 tons.

For the past two weeks men have been cleaning out drifts and other workings in the American Flag mine, and during the present week the boilers were fired up. This mine was a large producer in bygone days, and with the present high prices of silver and lead it is expected that it will again be among the leading producers of the district.

able to the Provincial government before the next session of the Legislature.

BARKERVILLE.—The district of which the historic town of Barkerville is the centre, well-known to all old-time Cariboo prospectors, is becoming active again in preparation for renewed work next spring. The activity is attributed to the quartz claims situated on Prosperpine mountain, four miles north of the town, having been acquired by the Mining Corporation of Canada; this corporation, which has its headquarters at Toronto, has already commenced carrying out plans for the development of the claims. Under the direction of Robert H. Bryce, late of Cobalt and Porcupine, a crew of more than fifty men is now at work. Cabins have been built providing sleeping and eating accommodations for 100 men, together with offices and other necessary buildings. John Bell, an old timer in the district, has taken a contract for the driving of two tunnels of 200 ft. each, and I. E. Moore has a contract for a third and a fourth to be constructed. Two diamond-drills are being shipped to the property and soon will start drilling.

KAMLOOPS.—The difficulty of obtaining labor is hampering the completion of a number of enterprises which

are expected to benefit the mining industry. One of these is the branch line of the Canadian National Railways between Kamloops and Kelowna by way of Grande Prairie and Vernon. Another is the branch railroad from the Kettle Valley railway to Copper mountain, where the Canada Copper Co. is opening, on a large scale, extensive deposits of low-grade copper. A third is the construction by the Kootenay Power & Light Co. of its power line from Bonnington Falls, where the power is developed, to Princeton, where it is to be used by the Canada Copper Co. in its new mill. The new Kamloops-Kelowna branch road will afford transportation facilities necessary to the development of the gypsum deposits at Grande Prairie, which are owned by the Manitoba Gypsum Co. and said to be of enormous extent.

GOLDEN.—The Tarheel Copper Mines, Golden Mining Division, are reported to have passed out of the control of J. C. Lineke, a majority interest having been secured by Calgary business men. A company has been formed and it is proposed to proceed with development. A contract will be let for the driving of a 100-ft. cross-cut tunnel to tap the orebody. Transportation facilities are to be improved to the end that the ore may be hauled direct and by a shorter route to the Kootenay Central railroad at Parson Station. The Provincial government is constructing a road from Parson to open up the Spillimachene River district which, it is asserted, will be the natural outlet for the mineral of that region.

ONTARIO

A NEW MINISTER OF MINES.—GENERAL NEWS OF THE PROVINCE

As a result of the recent Provincial elections, at which a majority of representatives belonging to the Farmers' and Labor parties was returned, a new administration assumed office on November 10. A desirable re-arrangement was effected in connection with the Department of Lands, Forests and Mines. It has been felt for some time that the increased importance of the mining interest of Ontario justified the establishment of a separate department having charge of mining affairs. This has been carried into effect by the new government, and Harry Mills, elected for Fort William as a Labor candidate, has been appointed Minister of Mines. Any misgivings which might have been felt by mine operators or investors as to the adoption of too radical a policy, in view of Mr. Mills antecedents, have been set at rest by the assurances of the new minister given to the members of the Toronto branch of the Canadian Mining Institute. "My interest," said Mr. Mills, "is in the rapid development of the mineral resources of this Province, and in order to bring this about we must have capital. That is understood by all. I, for one, am going to see that every invitation I can give will be given toward that end, that we may have more capital and lots of it to develop our resources. I want you to dispel any fears you may harbor on that point."

COBALT.—The Lumsden mine, situated about one-quarter of a mile from the Temiskaming and Beaver, has

been taken over by G. L. Campbell of Montreal. Arrangements have been made to thoroughly develop the property. The Mining Corporation of Canada, following recent negotiations, has secured an option on the adjoining Buffalo mine. Officials believe the consummation of a deal to be probable. The Buffalo was a pioneer in applying the oil-flotation process in the treatment of Cobalt ore. The cost of producing silver at the leading mines of Cobalt averages about 55 cents per ounce under present conditions. During October the Nipissing mine produced \$375,000, establishing one of the highest records in its history.

The Penn-Canadian Co. is making a bid for the Bailey-Cobalt mine, and offers to merge with the latter on a fifty-fifty basis. The Bailey is also considering an offer from the Northern Customs Concentrator.

The Buffalo Mines has decided upon a further reduction in capital. Starting with 1,000,000 shares of the par value of \$1 each, the company during the past two years returned 50 cents per share to its shareholders, thus reducing the capital to 1,000,000 shares of the par value of 50 cents each. It is now decided to pay another 35 cents per share and thus reduce the capital to 1,000,000 shares of the par value of 15 cents each.

PORCUPINE.—In the Porcupine gold area considerable difficulty is experienced in procuring men, and the Hollinger and Dome are working only at two-thirds capacity. According to an official, the report that an offer of \$10 per share for control of the Hollinger had been made is without foundation. The new orebody encountered at a depth of 1500 ft. on the McIntyre-Porcupine is reported to have a width of about seven feet and assays show an average grade of \$10 per ton in gold.

WEST SHINING TREE.—The Wasapika gold mine has acquired three additional mining claims adjoining each other to the north and carrying the extension of the Ribble vein on which the company is now working. This gives the Wasapika a mile and a half in all of the Ribble vein. The transaction made necessary a re-organization of the company with an increase of its capital from \$3,000,000 to \$6,000,000 in \$1 shares. Of the total, 3,000,000 shares will be allotted to the present company, 1,000,000 will be applied to the purchase of the additional claims, and 2,000,000 will remain in the treasury. A large modern mill will be erected. A New York financial house has undertaken to provide funds for the development of the Atlas mine. An 8-ft. vein carrying visible gold has been found in the adit being driven from the lake level.

CHIHUAHUA

MANY PROPERTIES ARE RE-OPENING.

In six months, if present conditions continue, Chihuahua will be 'on top', in the belief of mining men, with big exports of ore and bullion. Francisco Villa, a few months ago the terror of the State, now is considered a negligible quantity, due to the active campaign conducted against him by General Manuel M. Dieguez. Lately Villa is said, on good authority, to have been

deserted by the greater part of his following. He was seen recently at a ranch near Parral with five followers. Mining men are preparing to re-open their properties in all parts of the State, while stocks of merchandise are being rushed. The scarcity of supplies in the country back of the railroads may be gathered from the fact that mining men report a pair of overalls worth a cow, and a spool of thread selling at a dollar gold. While Villa had any strength merchants were afraid to increase their stocks and as a result they were allowed to dwindle down to nothing, even in the larger places.

The Dolores mine, situated in the south-eastern part of Chihuahua on the Chihuahua-Sonora boundary, will be opened soon, a force having started for the property with supplies sufficient for a considerable period. This is a rich silver-gold mine, and had a large ore-reserve developed at the time revolutionary conditions forced a shut-down. The Tecolote property at Santa Barbara also is preparing to re-open, a force being at work cleaning up on the surface and getting things in shape for operation.

A TYPICAL OCCURRENCE OF SILVER-COBALT-CALCITE VEINS,
COBALT, ONTARIO

Raoul DeFoureq is in charge. At Cusihiuriachic the Cusi Mining Co. is preparing to re-open all its properties, while preparations for resumption of operations are in evidence at Natividad and Ocampo and also at Jesus Maria, about 60 miles south of Temosachic. At the Terrazas mines, near Chihuahua City, preparations are expected to be started shortly for resumption of operations. Santa Eulalia is operating at as near capacity as the

management can arrange. More mines are operating in the Parral district than at any time in the last eight years.

Better than anything else as an indicator of the return of confidence in the situation is the number of 'scouts' in the field for foreign interests. More men are looking for mining investments at the present time than at any time since the revolution started. At the same time resumption of mine operations is reflected by the demand for powder. Two large shipments have been allowed to cross the border recently at El Paso, one of 600 and the other of 800 boxes. Six months at least will be required to put many of the mining properties back on a producing basis, owing to repairs, lack of material, and the fact that several of those in the outlying districts have been worked systematically by 'gambecinos' or 'high-graders' during the absence of the owners. The high-graders worked without system, gouging out rich pockets and paying no attention to the average rock or to timbering. To repair this damage will require time and patience. The spirit of the people appears to be excellent, as they are anxious to work and rebuild their shattered fortunes. There has been much suffering on account of lack of necessary clothing, and in some districts where there have been excellent crops the people are going about in rags. No difficulty is being experienced in obtaining plenty of mine labor at reasonable rates.

SONORA

YAQUI INDIANS BEING PURSUED BY FEDERAL TROOPS.

AGUA PRIETA.—Col. Abram Fraijo, presidente municipal of Agua Prieta, has, with his associates, located what is claimed to be a large deposit of coal about 12 miles south of the international boundary. Analyses made by assayers in Douglas show the samples submitted by Colonel Fraijo to contain 57% fixed carbon.

BABIACORA.—The Santa Ana property, on the Sonora river, is being operated under bond from N. S. Finch by Alfred Paul and J. V. Fryer. Recent discoveries of high-grade silver ore in a tunnel run under the old Spanish workings make the future of the property appear bright. Assays ran as high as 1300 oz. silver per ton. Yaqui depredations in that part of Sonora have interfered to some extent with plans of development of the property, chiefly by decreasing the efficiency of workmen, who are always on the alert for raiders, and by interfering with the transportation of supplies. A relatively small force is employed at the present time but more men will be added as room can be made for them underground. It is planned to erect a mill later.

MOCTEZUMA DISTRICT.—The Yaquis who were plundering in the eastern part of the Moctezuma district early in November have been driven southward into the Sahuaripa district, where at last reports several forces of Federal troops were converging upon them with the intention of effecting their capture or exterminating them. There are reported to be approximately 300 Indians in the main body, and between 1500 and 2000 Government troops are pursuing them.

CALIFORNIA

Colfax.—Unwatering the Rising Sun is proceeding. Electric power has been delivered by the Pacific Gas & Electric Co., and an electric pump of 400 gal. per min. has been erected.

Downieville.—James F. Hunt and associates are completing plans for resumption of work at the Gold Bluff and Oxford quartz properties, lately taken under bond and option. Both mines formerly yielded high-grade ore but have been worked intermittently in late years.—The shaft of the Strand & Nelson gravel property, near the Kirkpatrick group, has entered sand and is believed to be near the channel. The vertical shaft was sunk from a 100-ft. incline and follows the bedrock.

Grass Valley.—Recovery of the noted 'gambler's' lode on the western edge of Grass Valley has been announced by the Boundary Gold Mines Co. A strong vein, carrying visible gold, was found at 80 ft. Work for the recovery of the lode has been under way for two years.

Placerville.—Some of the operating mines inspected last week by J. W. Gebb, mine inspector for the State Industrial Accident Commission, were the Hook and Ladder, Ohio, Roundout, and Pacific deep gravel mines east of Placerville, and the property of the El Dorado Lime & Minerals Co., about twelve miles south-west.

San Andreas.—Repairs to the pipe-line at the Comet have been completed and arrangements made to place the compressor and mill in commission. Unwatering the winze from the lower tunnel is to be undertaken and sinking resumed. Future plans include addition of new equipment to effect a closer gold saving from refractory ores. Allen Doe is manager.—The Corn Meal group, near West Point, has passed under bond to E. E. Sellick, H. W. Post, and Fred Walker of Stockton, and New York people. Good ore is reported exposed near surface.

Sierra City.—Operations at the Cleveland and Monarch Consolidated, controlled by the R. G. Gillespie interests of Pittsburgh, Pennsylvania, are proceeding more satisfactorily than at any time in many years. Ore of excellent grade has been opened on the lower level of the Monarch Consolidated, and the 20-stamp mill is running steadily. At the Cleveland good ore is exposed and development of new ground is proving extension of the main veins. S. E. Montgomery is consulting engineer.

Taylorville.—The Gruss Mining Co. plans driving a cross-cut from the 400-ft. level of the Gruss mine 1000 to 1500 ft. on a copper orebody. The shaft is to be deepened 200 ft. and a lateral driven from this point. The present stamp-mill is to be re-modeled and provided with flotation equipment. W. J. Gruss is general manager.

COLORADO

Idaho Springs.—A Denver syndicate composed of W. O. Reynolds, president of the Hibernia Bank & Trust Co., W. W. Coudrey, H. A. Reyer, and A. P. Aroudel, has acquired the Refugee group of two lode claims and a placer claim, and it is understood is preparing to undertake their development. The group lies south-west from the Shafter, and

is connected through that property with the Big Five tunnel. The Refugee was at one time a producer of high-grade ore, but has been long inactive. Lieut. Aroudel, it is stated, will have charge of the proposed development.

IDAHO

Coeur d'Alene.—Normal production for all the producing mines of the Coeur d'Alene by December 1 is predicted by those in touch with the mining industry of the district. Slightly more than a month has elapsed since the strike of the International Union of Mine, Mill and Smelter Workers was called off on October 8 and all the mines affected have resumed operations at both mine and mills, and the normal production of the district is rapidly being approached.

Wallace.—The Federal Mining & Smelting Co. has declared a quarterly dividend of $\frac{1}{2}$ cent per share on its preferred stock. This is equivalent to \$60,000 on the issue of 120,000 shares. The disbursement will be made on December 15 to stockholders of record on November 25.

NEVADA

Austin.—According to interested parties negotiations are pending for the sale of the Nevada Birch Creek group, Birch Creek district, to a syndicate represented by Harry Stimler, of Tonopah, C. D. Wilkinson, of Goldfield, and other prominent operators. The Nevada Birch Creek comprises a group of claims located on the Cahill lode, discovered three months ago by Jack Cahill. Streaks of free-gold ore have been found in the upper tunnel at a depth of 50 ft. and the driving of a lower tunnel is proceeding to tap the lode at a depth of 150 ft. This tunnel is in 260 ft. and a cross-cut will probably be extended to the orebody.—Sinking is proceeding steadily at the South Extension group of the Cahill Lode Co. and Jack Cahill, the manager, expects to reach the vein shortly after passing through the porphyritic cap-rock, supposedly about 30 ft. thick at this point.

Goldfield.—A. W. L. Dunn and associates have acquired the General Washington mine, south of and adjoining the Cracker Jack. The property is to be developed from the 320-ft. level of the Cracker Jack shaft and cross-cuts driven to seek the extension of the Cracker Jack vein-system.—Driving the cross-cut from the 440-ft. level of the Cracker Jack has been resumed for the purpose of intersecting the orebody east of the present workings. In the bottom of the winze the vein assays \$30 per ton. It has been opened for a length of 120 ft. north and south of the raise above the 440-ft. level and averages 10 ft. wide with assays averaging around \$18 per ton.—The Dunn lease, in the old Engineers section of the Florence-Goldfield, has exposed an ore-shoot 10 to 20 in. wide sampling \$130 per ton. A shipment is being prepared. The Adamson-Traynor-McCall and Florence Divide leases are shipping regularly.—The Goldfield Development reports excellent ore on the north half of the Florence-Goldfield, which is being worked under long lease.—Red Hills-Florence has opened an ore-shoot assaying \$70 south of east-west fault in the Florence-Goldfield.

Reservation.—The Review Silver M. Co. has acquired the Review group of five claims and arranged for driving a 750-ft. tunnel. Orders have been placed for a compressor

and other equipment. The property adjoins the V-7 group on the south and is controlled by George W. Howell and associates of Oakland.—Elkton Divide has taken a lease on the Pinto claim of the Reservation Hill and is arranging for development of a vein of high-grade silver-lead ore. A substantial stock interest in this company has been taken by Boston and New York people.—Nevada Silver M. & D. Co. has begun work on the Dog group of six claims, south of the V-7 property.—The entire field is attracting wide attention and promises soon to become one of the important silver-lead-gold fields of Nevada. W. E. Casson, of Carson City, is heavily interested in most of the active companies.

Rochester.—An Oliver filter has been added to the Rochester mill and 100 to 150 tons of ore are going daily through the plant. Mill-heads are said to be averaging 10 oz. silver and \$2 gold. Development in the lower workings continues to expose good ore.

WASHINGTON

Colville.—The old Dominion mine east of Colville, famous in the annals of the north-west as a silver producer, will be re-opened within 60 days, according to word from Colville. It has been closed most of the time for 20 years. W. H. Linney will be in charge.

Stevens County.—The Copper Blossom group of 80 acres, six miles east of Valley, has been acquired by Evan Morgan for himself and associates under a bond from H. A. Van Buskirk of Hope, Idaho. Mr. Morgan was mine manager for the Loon Lake Copper Co. in the period of dividend payments. The property lies on the Chewelah-Loon Lake copper belt and between the United Silver-Copper and the Loon Lake mines, which are several miles apart.

BRITISH COLUMBIA

Fort Steele.—Spokane men are chief owners in the Victor-Silver Leaf Mining Co., which has given a lease to George Gundry of Spokane on its property on Mouse creek in the Fort Steele district. Mr. Gundry has returned from the East, where he is said to have secured financial backing, and will proceed with development and equipment plans. He has ordered equipment for a 50-ton concentrator, to be built at once, and within 30 days from the time the machinery arrives he hopes to be turning out concentrates.

Trail.—The Consolidated Mining & Smelting Co. received 4233 tons of ore in the first seven days of November. This is about the average of other recent weeks. The receipts in detail follow:

| Mine | Gross tons |
|---------------------------------|------------|
| Alamo Mill, Alamo..... | 90 |
| Bluebell, Riondel | 94 |
| Donohue, Nicola | 8 |
| Gentry, Cottonwood, Idaho..... | 34 |
| Highland, Cedar Creek..... | 70 |
| Josie, Rossland | 249 |

| Whitewater, Retallack | 32 |

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Oscar Lachmund is at Spokane.

D'Arcy Weatherbe is at Peking.

W. E. Simpson has returned from London to Cobalt.

J. B. Tyrrell has been examining mines in Eastern Manitoba.

Hallet R. Robbins has arrived in San Francisco from New York.

C. A. Banks has opened offices at 5 Nelson Court, Vancouver.

R. H. Stretch, of Seattle, is taking a holiday in Southern California.

D. V. Baron, owner of a group of claims at Oatman, is in New York.

H. D. Quimby, from Chewelah, Washington, is here on his way to Mexico.

Will H. Coghill is with the U. S. Bureau of Mines, at Golden, Colorado.

R. C. Gemmell has returned to Salt Lake City after a trip to Duluth and Chicago.

J. Mackintosh Bell has opened an office as consulting mining engineer at Toronto.

Willett G. Miller, Provincial Geologist of Ontario, has returned to Toronto from London.

J. W. D. Moodie, vice-president of the Britannic M. & S. Co., British Columbia, has been at Salt Lake City recently.

Frank Merricks has accepted the nomination to the presidency of the Institution of Mining and Metallurgy, in London.

Horace V. Winchell, president of the Institute, is expected in San Francisco on December 22, when he will address the local section.

Edel Moldenke, mining engineer, has returned to Watchung, New Jersey, after spending two years with the Burma Mines, in Burma.

Fred B. Ely has accepted a position in the geological department of the Pierson Oil Co., with headquarters at Shreveport, Louisiana.

H. C. Goodrich, chief engineer for the Utah Copper Co. and Bingham & Garfield Railway Co., has returned to Salt Lake City from Los Angeles.

A. G. Mackenzie, secretary of the Utah Chapter of the American Mining Congress, attended the annual meeting of that organization at St. Louis.

A. G. Burritt, mining geologist of Salt Lake City, is making an examination of oilfields in Louisiana, Oklahoma, and Arkansas for Eastern capitalists.

E. Gybbon Spilsbury is on his way to Brazil to study the question of establishing steel works in that country. He expects to be absent until February.

J. H. Lewis has left the Braden Copper Co., at Rancagua, Chile, where he was employed as assistant mill-superintendent, and is now at Spokane, Washington.

James G. Parmelee, recently research metallurgist with the School of Mines in co-operation with the U. S. Bureau of Mines, at Moscow, Idaho, is now connected with the Hardinge Conical Mill Co. at Salt Lake City.

Joseph B. Umpleby has resigned as geologist in charge, Section of Foreign Mineral Deposits, U. S. Geological Survey, to accept the position of Professor of Geology and Director of the School of Engineering Geology in the University of Oklahoma, at Norman.

THE METAL MARKET

METAL PRICES

San Francisco, November 25

| | |
|--|-------------|
| Aluminum dust, cents per pound..... | 65 |
| Antimony, cents per pound..... | 10.00 |
| Copper, electrolytic, cents per pound..... | 20.00 |
| Lead, pig, cents per pound..... | 7.00-8.00 |
| Platinum, pure, per ounce..... | \$140 |
| Platinum, 10% sodium, per ounce..... | \$160 |
| Quicksilver, per flask of 75 lb..... | \$75 |
| Spelter, cents per pound..... | 9.50 |
| Zinc dust, cents per pound..... | 11.00-13.50 |

EASTERN METAL MARKET

(By wire from New York)

November 25.—Copper is inactive and weak. Lead is quiet and firm. Zinc is dull and easy.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01 1/2 on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

MONEY AND EXCHANGE

It is beginning to be realized more and more by international bankers that not for many years will the foreign exchanges be restored to normal levels. It is customary in some quarters to ascribe the present discount on rates as due to the adverse trade balances of European countries, but keen students of the situation say the fundamental factor is the domestic state of finances in those countries, or more specifically, the depreciation of their respective currencies. When gold payment, including export of gold, is resumed, the currency depreciation will disappear. Some idea as to time of that resumption may be gathered from the fact that this country did not resume specie payments after the Civil War until 1879.

When the ban on trading in marks was lifted several months ago there began a steady decline in the rate from about eight cents until 3.15 cents was reached last month. A subsequent recovery brought the price back to 4 1/2 cents, but since then the mark has receded to 2.05 cents. There are several reasons which preclude an early recovery in this exchange, according to usually well-informed quarters. One is the highly speculative position. Many people bought the exchange in expectation of a quick profit which has not been realized; and they are likely to sell out on any material advance. The most important factor, however, is the large import of raw materials into Germany, and the fact that Americans are no longer buying marks as eagerly for speculative purposes as they did a month ago.

Now and then surprise is expressed that exchange rates on the Scandinavian countries have not led to importations of gold to the United States from that quarter, since the ruling discounts greatly exceed the cost of bringing the metal over. But the reason is not far to seek. It lies in the fact that those countries are somewhat in the same position as the late belligerent countries whose exchanges are also heavily depreciated.

The following table gives the amounts of foreign government and city loans floated in this country since the Armistice, with dates of maturity, interest rates, and offered prices:

| Government of: | Amount | Maturity | Rate | Offered |
|----------------------|---------------|---------------|-------|---------|
| Canada | \$75,000,000 | Aug. 1, 1921 | 5 1/2 | 99 1/4 |

| Lire: | Demand | | 11.80 |
| Marks | | | 2.80 |

Eastern Metal Market

New York, November 19.

The markets are featureless and uninteresting. Demand in all cases is light and the price in most metals is downward.

On poor demand and freer offerings copper quotations have receded.

The tin market has been quiet with little inquiry or buying. Prices are easier.

A development of strength characterized the lead market, but demand is light. Prices are a little higher.

The zinc market is dull but fairly steady and firm.

Antimony is higher.

IRON AND STEEL

The prospect that the difficulty in securing supplies will increase rather than diminish for some months dominates this market. Further advances have been experienced in pig-iron, about \$2 per ton in steel-making grades and \$1 to \$2 for foundry irons, and large sales are reported, chiefly for the first and second quarter of next week. In fact, much iron could be sold except for the fact that several makers have withdrawn from the market. Resumption of 10 to 12 blast-furnaces is reported. There have been sales of Canadian pig-iron to melters in the United States also. There are estimates that the railroads will buy 1,000,000 tons of rails when they are turned back. Recent sales for exports include 20,000,000 boxes of tin plates at \$8 and several thousand tons of rails. There is a marked shortage of sheets and automobile makers are building up prices, as high as \$30 premium having been offered.

COPPER

It is generally understood that some of the large producers have been recently sounding consumers at considerably lower levels than have prevailed. It is evidently realized that production is in excess of consumption and has been for some time, and that unless sales are stimulated a curtailment in output will be necessary. Offerings as low as 20c., New York, for electrolytic copper for delivery this year are reported, which contrasts with 20.75c. to 21c. a week ago. It appears that the smaller producers and the speculators or dealers are also making similar offerings. The market may therefore be described as quiet and lower with electrolytic quoted at about 20c. to 20.25c., New York, for early or this year's delivery, with Lake copper at 20.50c. to 20.75c., New York. Very little business has thus far resulted; it is understood. Exports for the first nine months have been about 19,200 tons per month with imports at about 15,400 tons per month. Consumption is being rather reduced than otherwise, and the future of the market is uncertain, buying for export being a factor hard to predict.

TIN

The week has been a quiet one. Only light sales have been made for either prompt or future shipment. This has been a disappointment to many, as the official ending of the coal strike was expected to result in plenty of business. It is possible that the big men, however, knew that the 'official' ending was not a 'real' ending of the strike. On some days the price of spot Straits tin has been higher than previously, due to congestion at the docks. Prices have been as high as 54.50c., New York, the latter part of last week. Today, however, spot Straits can be bought at 53.82½c., New York, with metal ex-steamer at dock at 53.25c. The last quotation for December-January shipment from the East was 53.50c. It is evident that the pressure of large supplies has not remedied the situation. The market is entirely feature-

less. Thus far this month arrivals have been 1365 tons, with the quantity afloat 5340 tons, which is still relatively large.

LEAD

The market has developed some strength but there has been no large demand recorded. The stronger market is due more to a limited supply rather than to increased demand. Some selling agencies are asking close to 7c., New York, but it is believed that this is extreme and without significant meaning. It is rumored but not confirmed that the leading interest may not be selling at its present quotation of 6.75c., New York, and 6.50c., St. Louis. We quote the market as 6.80c., New York, and 6.55c. to 6.65c., St. Louis, for early delivery.

ZINC

Since the report of last week the market experienced an advance to the 8c. St. Louis level, due largely to a better demand for export, especially by way of Southern ports, and to other causes. At this level the larger producers were more interested and did some business, it is reported. Since then, however, the market has eased off slightly to 7.95c., St. Louis, or 8.30c., New York, for prime Western for this year's delivery and has again become quiet. Domestic buying is not a large factor and the future is uncertain. Galvanizers are evidently not attracted by the present levels, perhaps considering these high in view of past prices. At any rate they are probably provided for at present. The demand for export has again eased off.

ANTIMONY

The market is stronger and demand is better with Asiatic grades quoted at 9.25c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

Virgin metal, 98 to 99% pure, is still quoted at 32c. to 33c., New York, for wholesale lots for early delivery.

ORES

Tungsten: The market continues quiet, but a little business is reported. The tariff is the controlling factor and not much activity is expected until this is cleaned up. Some South American ore has sold at \$10 per unit. Other ores, such as Chinese and Bolivian, are quoted at \$7 to \$10 per unit. Ferro-tungsten has not been tested, but is probably obtainable around \$1.25 per lb. of contained tungsten.

Molybdenum: Quotations are nominal at 75c. per lb. of MoS₂ in 90% material. No business has been heard of.

Manganese-Iron Alloys: The spiegeleisen market is active and strong at \$35, furnace. There have been sales of several thousand tons for domestic and foreign consumption, and inquiries for both deliveries run into the thousands of tons, perhaps up to 5000 tons. No British ferro-manganese is in the market at present for any delivery, but there are sales of small lots of domestic alloy up to 300 tons each at \$110, delivered, for this and first quarter delivery, with inquiries totaling 1000 tons. The market is quiet but firm.

Unless copper sales improve considerably within the next three weeks, copper companies will begin to curtail output drastically. Large producers wish to keep their working organizations together, but they are beginning to believe that it will take much longer to get Europe back to normal than was at first expected, in spite of certain plans that are expected to hasten German buying.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

THE MINERS' 'HARD BOILED' PROTECTIVE CAP

The latest addition to the safety department of E. D. Bullard, of San Francisco, is a miners' 'hard boiled' cap that is blow-resisting, fire and water-proof, and a non-conductor of electricity. This is a safety device that has been long looked for by miners and mining companies. It will prevent head injuries from falling ground and projecting ledges, as well as from low trolley wires and exposed power lines.

The new cap will prove a great benefit to mining companies from a purely monetary standpoint, because of its tremendous strength and durability, which will make it outlast a dozen or more of the old duck lamp-cap, and particularly because it will practically eliminate accident compensation for head injuries to employees.

A blow of sufficient force to break the 'hard boiled' cap would cause a fracture of the skull of an unprotected miner,

for the carbide cap-lamp and will be supplied in every desired size.

Taking it all in all, the 'hard boiled' cap is a big step forward both in safety and economy.

BUTTE WATER COMPANY

In 1892, the Redwood Manufacturers Co. installed a line of Remco continuous-stave redwood pipe 46,000 ft. in length and 24 in. diameter from a reservoir in the mountains to a connection with the city system of Butte. The pipe operates under 160 ft. static head. One of the peculiarities is that the water is pumped from the streams on the Atlantic side of the continental divide to a reservoir on the Pacific side, and that the water, which, if allowed to take its natural course, would flow into the Gulf of Mexico, actually, after flowing through the pipe, reaches the Pacific ocean.

In 1899, the Redwood Manufacturers Co. installed for the Butte Water Co. 64,700 ft. of 24-in. Remco continuous-stave redwood pipe and 32,600 ft. of 26-in., which was an additional supply-line for the city of Butte. This line runs from the Big Hole river to a connection with the city system on the outskirts of Butte, and is under a pumping pressure averaging 200 ft. static head.

In October 1919, the Butte Water Co. awarded a contract to the Redwood Manufacturers Co. for 24 miles of 26 and 24-in. Remco continuous-stave pipe for additional water supply. This line also runs from the pumping plant on the Big Hole river to a connection with the city system, and will be installed in the summer of 1920.

Eugene Carroll, one of the foremost hydraulic engineers of the United States, was general manager for the Butte Water Co. in 1892 when the first line was installed, and has been so continuously since.

The lines installed in 1892 and 1899 were thoroughly examined in October 1919, and found to be free from any deterioration whatever. The redwood shows no decay and is in its original condition. The pipe-lines have never ceased operations for a single day since they were installed, notwithstanding the fact that they are situated in a locality where the temperature goes 50° below zero at times, winter conditions being severe at all times.

For the 28 years of its existence, the original line has supplied the city of Butte and the big mines therein with water, and has never failed to deliver it, nor has the line built in '99 caused any delay.

The awarding of the contract in 1919 by Mr. Carroll is sufficient evidence of his opinion of the quality of Remco pipe. Mr. Carroll will be glad to give any person interested in the details a complete record of these two famous lines.

James A. Lannon, formerly general superintendent for the Atlas Mining & Milling Co. of Ouray, Colorado, has associated himself with the Denver Engineering Works Co., the Aldrich Pump Co., and the Victor M. Braschi Machinery Co. of Mexico City, as their representative and will have headquarters at Mexico City with the Braschi Machinery Co.

Two Views of the 'Hard Boiled' Cap

or one wearing the old style duck cap. By actual test a 20-lb. iron weight dropped two feet upon the cap (the cap lying upon a solid concrete floor) did not break it at any point. A one-pound bolt dropped forty feet struck squarely on the crown of the cap (on the head of a workman), barely dented it and in no way injured the wearer.

The cap is entirely water-proof and a perfect non-conductor of electricity; weighs but seven ounces, and is as comfortable to the wearer as any hat or cap can be. As for durability, the trial period of 18 months to which the first experimental caps were subjected left them all in good wearable condition. It has a false top and the air space between this and the true crown of the cap is filled with a soft cushioning material and the truss form given by the design makes the top practically unbreakable. The strong canvas lining of the cap is provided with a draw-string in the crown by means of which the comfortable set of the cap upon the wearer's head is assured; this device also adds to the shock-absorbing capacity of the cap.

The 'hard boiled' safety cap carries the regulation bracket

AMONG American mining enterprises abroad, we note the South American Gold & Platinum Co., a prospectus of which has been sent to us by the well-known brokers, Weir Brothers & Co., of New York. The directors include Messrs. Adolph, Frederick, and Sam Lewishohn, together with Messrs. J. Parke Channing and A. F. Keene. The mines are in the Choco province of Colombia, on the San Juan and Condoto rivers, where the Consolidated Gold Fields of South Africa, through a subsidiary company called the Anglo-Colombian Development Company, Ltd., has been operating with some success since 1911. The present venture marks the absorption of the British company by the one in New York and indicates the raising of American capital for the purpose of building new steel dredges and otherwise placing the enterprise on a better engineering basis.

FROM the Federal Trade Commission's report, we get the total \$672,168,916 as the capital invested in American copper-mining enterprises. On this, 28% was made in 1918. The results for the current year, it is safe to say, will be considerably smaller. In Mexico and South America \$95,854,812 is invested in six companies, including the Chile, Braden, Cerro de Pasco, and Greene-Canea properties. The companies in Arizona and New Mexico represent an investment of \$255,588,541 and a return of 31.7%, but it is a group of 22 companies, not distributed geographically, that shows the best return, namely, 69.3% on an aggregate capital of \$10,527,387. The Michigan group has invested the sum of \$74,615,578, on which only 21.3% was paid last year. Of the total American production, 38.3% came from Arizona and New Mexico; in these States 30 companies were contributory.

THE unfortunate plight of the gold-mining industry has been emphasized again, this time by some of the members of the British Columbia Chamber of Mines. In recognition of the fact that, since taxes were last adjusted, mining costs have doubled, while the worth of the product remains the same, a committee has been formed representing the Chamber of Mines, the Canadian Mining Institute, and the mine-owners, for the purpose of investigating the matter and making a report before the next session of the Legislature. We are reminded of the resolution before the American Mining Congress, to tax gold used in manufacture and the arts at \$10 per ounce for the benefit of the producers, and of the 15% premium being paid on gold produced by the South African mines.

If the present costs, which are disastrous to the marginal group of mines, persist, it will become necessary for this country to face the issue squarely.

NO definite result has ensued as yet from the diplomatic correspondence between Washington and the alleged government of Señor Carranza, but "last straws" are accumulating rapidly, and in time there will be enough of them to make it comfortable for Don Venustiano to lie down. We suspect that he is looking for a chance to slip out of Mexico with the proceeds of his dictatorship and retire to Madrid or Paris, joining the company of other so-called Spanish-American ex-presidents, governors, and generals, for whom their home land has become too hot. It is unlikely that he will allow the Jenkins affair to go too far. Having sent one or two sneering notes to our Secretary of State, he will release Mr. Jenkins and let the matter drop. Then we shall have another 'incident', meaning that another of our people will be robbed or murdered. Some day the end will come, but not yet.

KOLCHAK'S defeat and his evacuation of Omsk is much to be regretted, for to him those engaged in mining operations in Siberia were looking for a restoration of orderly government in that immense mineral territory. His army evidently has been badly beaten by the Bolshevik forces and has been compelled to lose a large stock of munitions, railroad equipment, and other valuable supplies. We hope to hear that the few American and British engineers remaining at the mines have been able to escape the oncoming Red wave. In our issue of October 11 we summarized conditions in Siberia in their relation to the Anglo-American mining enterprises and explained how work was still proceeding hopefully at Kyshtim, Ridder, and Ekibastus. These settlements must now be in the hands of the Bolsheviks, and the faithful Kirghiz will have left the mines for their homes in the open steppe, where safety lies. It is remarkable that despite the desperate condition of affairs in Siberia during the last two years, the shares of the Russian companies registered in London should have held so firmly. For instance, according to 'The Financial Times' of November 13, the principal stocks were quoted as follows, in pounds sterling: Irtysh 1½, Kyshtim 1½, Lena Goldfields 1½, Russo-Asiatic 4½, Sissert 1½, Spassky 1½, and Tanalyk 1½. It would seem to us that the destruction of property and the probable delay in the resumption of

operations should have depressed the market more than it appears to have done, but we regard the firmness of the share-market as evidence of the courage and tenacity of the proprietors—qualities that we hope and expect to see amply rewarded in the near future, when Siberia emerges from chaos.

IN our last issue we mentioned Mr. Loring's name in connection with the great Burma mine. It is interesting to note his success in re-opening and developing the old Morgan and Calaveras groups of claims on Carson Hill, at the southern end of Calaveras county, which, of course, is in the belt known as the Mother Lode of California. The successful expansion of this mining enterprise is highly gratifying to Californians and to the Boston shareholders of the Carson Hill Gold Mining Co. During the first nine months of the current year the company has mined and milled 59,725 tons of ore yielding \$13.55 in bullion. Since midsummer Mr. Loring has been opening up the deepest level, at 865 feet, where for a length of 135 feet and a width of 25 feet the ore averages \$50 per ton. The ore assured is estimated at 210,000 tons averaging \$28 per ton, or \$5,880,000 gross. The total cost of realization is stated to be \$16 per ton. The Calaveras Consolidated, which is now part of the Carson Hill property, belonged to an English company, which operated a 20-stamp mill twenty-five years ago. This part of the property is on the Mother Lode itself, whereas the Morgan orebody is in a parallel vein. Mr. Loring expects the Calaveras ground to yield a large tonnage of \$5 to \$7 ore, similar in grade and character to that mined in Amador county, where he has re-opened the Plymouth mine so successfully in behalf of his British clients. We like to see the native son returning from foreign parts and succeeding in developing the mineral resources of his own State.

IT may well be that the present deadlock over a settlement of wages for the coal-miners will result in legislation that will prevent combinations of unions to enforce their demands by nation-wide strikes, or by any strikes that extend beyond the district primarily involved. The Government long ago passed laws forbidding combinations in restraint of trade, the intent being to prevent corporations, that is, Capital, from combining so as to throttle competition and victimize the consumer. There is no reason why Labor should be immune from restraining legislation that would in a similar way restrict its power, and prevent attempts, such as the one we are now witnessing by the coal-miners, to enforce demands by bullying the entire country. The local strike is in many cases the only way in which employees can protect themselves against the oppressions of unscrupulous employers, and when necessary it is a weapon the use of which receives public sanction. The nation-wide strike does not fall in the same class; inevitably it involves many districts where the men have no grievances; its logical accompaniment is the sympathetic strike, a still more vicious method of attempting to coerce unreasonable employers at the expense of the public at large. The

issue has become quite clear during the progress of the coal strike, and the support accorded the Government by the nation has shown the trend of public opinion. No group, no matter how well organized, can fight the entire country for long. Organized labor, by its foolish advocacy of the nation-wide strike, and its futile threats, which are now becoming common, to "tie up the whole country", is bringing about the curtailment of its own power. One of the most obvious weaknesses in human nature is not knowing where to stop; organized labor, which has benefited the condition of the working-man to a great degree, is showing evidence now of this weakness; the unions, through repeated victories, are fast reaching the condition of foolish pride that precedes a fall. We believe that Labor, if it is wise, will hold fast what it has won, and through moderation and fair dealing continue to retain that public support which has been responsible in the past for the successful assertion of its just rights. Otherwise, it will prove to be its own worst enemy; arrogant with power, it will overstep the bounds, as kings and princes have overstepped them since the dawn of history, then an exasperated and sorely-tried public will arise in resentment and bring the entire edifice of unionism to the ground.

BY courtesy of a friend in Arizona, we have received a copy of a remarkable report on a copper mine. We believe that it was written in good faith; therefore we shall not pillory the perpetrator, nor mention the name of the alleged mine. Among other items of valuable information given in this report we note that "the fisher veins are chiefly divided into schist and gneiss . . . The chief mineral changes are the re-crystallization of feldspar and the production of muscovite quartz and actinolite." The presence of the last of these is undoubtedly a sign of secondary enrichment. Next we learn that "most beds containing organic matter give off a certain amount of sulphurated hydrogen; in fact, certain schales and limestones have this peculiarity. We call it fatid limestone, and limestone is plentiful on this property; also I find schale and iron causes of ore precipitation." We have heard of the wise old fellows of the days gone-by that had "a good nose for ore"; now we know how it happened. "A strong iron cap is a shure sign of a large ore body underneath," he says. Again, "a strong iron cap is proof of a large ore body." Some element of truth in this, but over-done, is it not? "There is about 10 claims of this property that is iron capping and on those claims the ore assays 14 and 15 per cent copper and some places in gold, also plenty wood and water, on this property there is three contacts on this iron capping that is diorite and rhyolite, and one dike of lime that has not been broken up." And it never will be, for like King Arthur's city, which was built to music, and therefore was never built at all, it was made for ever, and could not be broken by the forces of nature or the blows of fact. We hazard the guess that the "wood and water" are more likely to be present in a ratio of 15% than the copper, for later we are told that "this iron covers the most valuable ore, which is found by sinking through it. In

some parts of this iron there is much diorite and rhyolite," all of which suggests a geologic hash that can only be attributed to a volcanic cataclysm of a subversive kind. Moreover, it is a mineralogic melange, for "on the west side of the property the rock has undergone displacement, and is sprinkled with disconnected crystals of the ore, that is, copper, gold and silver". Then, at the conclusion of these delirious trimmings of geology, the scribe says something that is both true and well expressed: "Shifting minerals result in concentration, and where metallic minerals are concentrated ore deposits are formed." That is good. The processes by which minerals are segregated into masses rendering them exploitable at a profit, and thereby constituting orebodies, is a process of natural concentration, slow and patient, from a bygone geologic day to the moment when the miner's pick discloses it to human industry.

American Mining Congress

In the latest issue of the monthly 'Journal' published by the American Mining Congress we find the announcement of "a plan of enlargement" involving the creation of new departments for the systematic collection of statistical and industrial information. It is stated that "it is planned to still further add to the organization until it shall have one capable man at the head of a division devoted to each of the various branches of the mining industry, thus having what will in effect be several organizations, each with its division chief, all co-operating as one organization." In short, the Congress is to organize a Bureau of Mines. "This bureau," it is explained officially, "is undertaking to correlate the information gathered by the various governmental agencies, and to gather such additional information as will tie together and apply this information in a practical way to the basic principles of each branch of production." This last is more grandiose than explicit, but it suggests a comprehensive scheme. Finally we are told that "this bureau will be available to Members of Congress and others in position to use such information as a means through which to obtain absolutely reliable and complete information concerning every branch of the industry, and to see to it that governmental investigations shall carry the practical features which will make them of the greatest service, not only to legislators in framing laws to meet practical conditions but to operators in planning their operations so as to get the best possible results." This also is fine and large, but the question arises at once, what is the U. S. Bureau of Mines doing, if the Mining Congress feels impelled to organize a bureau to give more information and "apply it in a practical way". Has the U. S. Bureau of Mines failed to give "absolutely reliable and complete information concerning every branch of industry", meaning the mining industry, we presume, for the Mining Congress cannot possibly be planning to cover all industry in its purview. Have the "governmental investigations" failed to "carry the practical features which will make them of the greatest service" to legislators and mine operators? We think not. It

looks to us as if we were going to see merely a further duplication of scientific and economic information, of which duplication there is already enough and to spare at Washington. One of the humors, if not scandals, of the war period was the way in which the Geological Survey, the Bureau of Mines, the Treasury, and the Department of Commerce collected data on identical subjects and worried mine operators with iterative questionnaires. What is needed today is closer co-operation between the various Federal departments, so as to save the taxpayer's money and systematize the vast collection of statistical and industrial information that is collected at Washington. We do not need any more multiplication of such agencies. It is wasteful and expensive. The Mining Congress proposes to defray the cost of its new departure by levying a contribution of 10 cents per 1000 dollars of production at the mines. If the mining companies choose to defray the expenses of the new bureau at Washington, it is their affair; but will it not be advisable to consider the demobilization of the technical gentlemen on the staff of the U. S. Bureau of Mines? The mention of the idea is enough to kill it. The U. S. Bureau of Mines, under Mr. Van H. Manning, is doing a splendid public service, conscientiously and successfully. We believe that Mr. J. F. Callbreath and his friends can do no better, if as well. Moreover, it is curious that the Mining Congress, to whose propagandism we owe the creation of the U. S. Bureau of Mines and the appointment of its first director, should now come out with a proposal to be a Bureau of Mines on its own account; it is killing its own child, which is considered bad form in polite society. Two pages of the 'Journal' are devoted to charts illustrating the intricate system of organization it is proposed to establish. On one we note the "Statistical, Administrative, Legislative Council", with lines leading to circles named 'Copper', 'Coal', 'Base Metals', 'Precious Metals and Rare Metals', 'Iron and Ferro-Alloy Metals', 'Non-Ferrous Minerals, Including Oil-Shale', and 'Petroleum'. These attach themselves to a 'Bureau of Mining Economics', to which is appended a 'Publicity Department', tied, in turn, to 'Lecture Bureau' and 'Press Service'. To us, this verges on absurdity, which is reached by the next chart, on which one big black balloon is attached to six baby balloons, named according to the gentlemen responsible for the several departments covering the proposed comprehensive activities of the Mining Congress. It is a foolish project. We say so without ill feeling, for we have supported the Congress in performing the work that was within its proper scope. This work has been done well by Mr. Callbreath, and the industry is grateful to him for what he has done; but the new departure is a blunder. We ventured to warn the Congress against such a step when it met in San Francisco last January. We said then: "If the Mining Congress should fail, it will be by branching out unduly and trespassing on the preserves of the official agencies. We believe that the Mining Congress has a useful function to perform on behalf of the mining industry, and we trust that it will not endanger its effectiveness by undertaking

to do too much." That is exactly what it is now doing. Let it stick to its proper function; that function is to serve as a permanent lobby at Washington in behalf of the mining industry. If it engages in the multitudinous activities now planned it will bankrupt itself in funds and in character. Mr. Callbreath had better "stick to his knittin'".

Mr. Gompers and Strikes

One of the regrettable developments of labor aggression and capitalistic reaction is the driving of moderate men into the camps of the extremists. That is regrettable because unless a few forceful men remain moderate and judicial there will be increased difficulty in adjusting the problems of the hour. For example, Mr. Samuel Gompers appears to have lost much of his usefulness as a leader of labor by having been driven by the extremists among his own followers, and later by the uncompromising attitude of sundry exponents of capitalism, into alignment with the radical and subversive elements. During the War he behaved splendidly; his loyalty to the Government and to the cause to which the United States was committed, his thorough rejection of the German propaganda and his outspoken detestation of the crimes perpetrated by Germany, were greatly helpful to our winning of the War because they brought the ranks of labor into line with the national effort. He even did so worthily as to be attacked by 'The Nation', a distinction of which any good American may be proud. Since then he has been harassed by the more violent among his followers. He allowed himself to be driven into making the unpardonable blunder of supporting the striking policemen at Boston. This was a fatal error on the part of the head of the American Federation of Labor, for it indicates a lack of sound civic principle. Since then he has become party to a statement justifying the coal strike and condemning the injunction proceedings of the Government. The misunderstanding in regard to the promises made by Federal officials concerning the incidence of the Lever Act gives some excuse for his disappointment, even for his bitterness, but for the breaking of the contract between the coal-miners and the operators, Mr. Gompers can offer no excuse that will go down with the public. Such breaches of faith cannot be tolerated in a highly organized society; they entail irretrievable confusion, as well as wrong. This country fought to save democracy, but it is quite certain that the democratic system of living will be destroyed if public contracts are broken at the will of a mob or at the behest of a syndicate; it does not matter which. For that reason we would like to see the President reply fully, justifying his action in using the Lever Act against the coal-strikers. We believe that he can justify it and that the statements made by Mr. Gompers do not cover the facts fully. The President was warranted, it seems to us, in using any legal method helpful to the purpose in hand, namely, to prevent the country from being victimized by a general coal-strike. As Governor Coolidge has said, "There is no right to strike against the public safety by anybody, anywhere, at

any time." "Safety" includes not only protection from disorder, but the assurance of continued food and transportation, the things essential to the life of the nation. Unless the Government can protect the people from social sabotage on the part of these warring industrial factions, it cannot be a government "for the people". When a quarrel between mine-owners and mine-workers reaches a point where the national welfare is imperiled, they must be made to stop, just as a quarrel between two individuals is stopped by the police when it interferes with the safety of their neighbors. Government exists for the purpose of keeping the peace; without it we go to the jungle or to the soviet. By the way, Governor Coolidge's given name, Calvin, smacks delightfully of Puritan New England. We like to see that tradition in the ascendant; let us have more of it, and less of the Sinn Fein and Jugo-Slav element in the political life of this country.

No improvement in the coal strike is visible, and contradictory statements are appearing from day to day in the newspapers. We note, however, that official statistics show a resumption of work equal to 50% of normal at the end of November, as against 29% in the first week and 33% in the second week of the strike. Mr. Garfield, the head of the Fuel Administration, has exhibited intelligence and sagacity in his efforts to settle the dispute and there is every reason to believe that his award of a 14% increase in wages is based upon a correct understanding of the facts. The one thing that does not seem to be sufficiently considered is the irregularity of employment and the large proportion of idleness characteristic of the coal miner's life. An average of \$1550.58 per annum is high, compared with the salaries of teachers and professors, a class that should engage the interest and support of a democracy more than any other type of men, because upon education depends the very life of representative government. An average of \$6.18 per day likewise is high, but it indicates an average loss of time amounting to 115 days per annum. Mr. Garfield is making an earnest effort to placate both the miners and the operators, and he has insisted repeatedly and most properly that no settlement can be considered that will increase the price of coal to the consumer. The public is awake to its interest in the matter, particularly as the drop in temperature and the fall of snow have brought home the fact that winter has arrived. Meanwhile Dr. Butler of Columbia, who never speaks publicly without saying something worth while, has suggested that it is futile to encourage a struggle of classes by regarding labor, capital, and the public as of equal importance in the social organization. Labor is a group of men working for wages, capital is a group of men employing labor, but both labor and capital constitute subordinate parts of the public. "The public is always everywhere their superior and includes them both." We venture to put it another way: Labor and capital are only parts of a complex social structure, and society as a whole must insist that both of them recognize their obligations to the body politic, under the laws of which, and for the welfare of which, they are supposed to operate.

Steel on the Pacific Coast

The Editor:

Sir—Under discussion, in your issue of November 15, Mr. R. C. Gosrow asks why steel cannot be made on the Pacific Coast by known and approved methods, by which, I take it, he means the reduction of ore in a blast-furnace and the subsequent conversion of the iron into steel in either open-hearth furnaces or Bessemer converters, according to the quality of steel desired.

The reason that this method cannot be applied on the Pacific Coast is that the bulk of the accessible ore on the Coast is magnetite, which cannot be reduced by ordinary blast-furnace practice without an addition of considerable quantities of more reducible iron ore, that is, ore that can be smelted at a lower temperature than is necessary for the reduction of magnetite. At any rate, so far as British Columbia and California are concerned, ore of the desired quality for this purpose has not been found in sufficient quantity in accessible situations, hence the metallurgist must have recourse either to the electric furnace, which gives a higher temperature, or to some untried modification of the blast-furnace that will bring about the same result. Hence, again, the necessity for experimentation. The electric furnace has been used in Sweden for about 20 years for the reduction of magnetite to pig-iron, but even so, it hardly can be said to have passed the experimental stage. A number of different types of furnace are employed and each type has its champions. Besides, conditions are not comparable; both labor and power are considerably cheaper there than here.

Thus, it seems to me, that we on the Pacific Coast, unless we can find a deposit of hematite, limonite, or other easily reducible ore, must work out our own iron problems to fit local conditions. Mr. Gosrow objects, too, to the attempts that are being made to make steel directly from iron ore in one operation. At first blush this may seem to be an ambitious undertaking, but it must be remembered that the control of both temperature and atmosphere (reducing, oxidizing, or inert) are infinitely greater in the electric furnace than in any form of combustion furnace, and by the careful use of this control I can see no good reason why a process should not be evolved for the production of steel directly from ore. If this can be accomplished at all, it is likely that it will be done at a considerably lighter fuel and labor expense than is necessary for the double operation, and, at the present time—irrespective of the immediate conditions brought about by the coal strike—fuel is as

important a consideration as labor. The price of coal in Victoria, for example, has risen from the pre-war price of \$6.50 to \$11.50 per ton, which was the ruling figure before the coal strike in the United States.

The main thing in this research work is to see that public money is not wasted in fantastic experimentation. There are a number of people who always are willing to try to get something for nothing, people who are willing to spend state or provincial funds on researches on which they would not spend their own, and, unfortunately, there are those in authority who seem willing to provide such funds. The Province of British Columbia has been duped in this way on a number of occasions, notwithstanding that there are wise enough heads to keep it straight if those who have the spending of the money choose to seek and abide by such counsel

Victoria, B. C., November 20.

The Salaries of Engineers

The Editor:

Sir—In your issue of October 18 I read with interest the communication from Mr. R. H. Toll on the subject of the small remuneration received by the technically trained man for his services.

I would venture an opinion that labor, mental and physical, is a commodity and therefore subject to the law of supply and demand. We witnessed the difficulty of maintaining an arbitrary price on copper in defiance of this law. The labor-unions claim credit for higher wages and better conditions for their members. Within certain limits arbitrary wage-fixing may be effective, but in the long run economic conditions determine the wage of the worker, based on the demand for his services. The lower limit of wages is that below which subsistence and support of a family are impossible and the upper limit that which makes the industry unprofitable. The nearer these limits come together the less effective unionism becomes in securing better conditions. It appears that this is the case now; the solution lies in eliminating waste and increasing efficiency, doing away with profiteering and repairing the wastes of war.

The point I want to make is that the engineer and brain-worker is poorly paid because the supply exceeds the demand. There exists in industry a limited demand for a certain percentage of brain-labor; the larger demand is for manual labor, skilled and unskilled. The young engineer and brain-workers in general accept this condition, because their road is the quickest way to the top of the ladder (perhaps only in their own minds).

It does not discourage young men from taking a technical training at college for this reason. Unfortunately the millenium has not yet arrived and the products of our mines, farms, and forests are won mainly by brawn.

Alice Arm, B. C., October 31. HEWITT O. FEARN.

The Editor:

Sir—I would like to add a few words to Mr. W. F. Dietrich's discussion, in your issue of November 8, especially since he has brought up the question of salaries paid to engineers and oil geologists.

In the Tampico oilfields, whence I have just returned, the oil companies are taking on young geologists at salaries ranging from \$250 to \$350 U. S. currency per month and all expenses, whether they are in town or in the field. The greater number of these men are still either sophomores or juniors in college. I do not think that these geologists are over-paid, for their work in that country entitles them to high salaries, but I do wish to point out that American surveyors, working side by side with these men and undergoing as great dangers and difficulties are in most cases drawing only \$175 to \$200 per month and expenses. These engineers are all *graduates* of good engineering schools and have had at least from one to three years experience in their profession. Can any one tell why there is such a large difference between the salary of an experienced man and an inexperienced one? After spending four years in an engineering college, the young engineer's investment should at least command the same salary as the young geologist, since they work together and are therefore indispensable to each other.

EDWARD D. LYNTON.

Los Angeles, November 15.

Mine Accidents

The Editor:

Sir—I would like to add a few remarks to the article written by Albert H. Fay in your issue of November 8, 1919, on 'Mine Accidents: English-Speaking v. Non-English Speaking Employees'. As we all know throughout this great country of ours, we have more men of different nationalities working underground than any one nation in the world, and these men as a rule, outside the English-speaking people, are incompetent miners or muckers; of course, you will find some exceptions among the non-English speaking people. The reason for this incompetency is that they have never had experience in underground work, only farming and outside work. With all my experience of mining in America and England I find most of the accidents are due to carelessness of these men, making conditions very unsafe for all concerned. As a general rule in England the miners must talk the English language, which I think is as it ought to be. We have here so many different nationalities to contend with that this method is hardly practicable at present. I recall an incident at Livingston, Montana. We were driving a tunnel, two side-drifts and a heading, using crown-bars in the centre, working eight men in the heading

(hand work), four in the face and two on each side. The ground being very heavy, it had to be watched closely; at this time the ground was taking weight and the crown-bars were cracking. The men were ready to run and jump off the bench, about 15 ft. high, which no doubt would have meant injury to all. I backed them all to the face of heading, and myself and another man braced up the crown-bars and timbers safely under dangerous conditions, thus avoiding a serious accident, and when I told the men to resume work they said, "You good boss, me jump, me hurt," and that little happening made these men 100% better miners.

Here in Grass Valley we have very competent miners, and the one thing that makes the miners careful is the Safety Bear club we organized several months ago, holding meetings twice a month. The subjects of discussion are the ways and means of avoiding accidents, methods for 'safety first', and 'first aid' work, all of which are interesting, and the men all take it seriously. We also have a safety committee, which inspects the company's two mines, and they report each month the places that are not safe, and then officials see that these places are fixed and placed in good condition. The company spares no expense whatever in rectifying these things for the safety of their employees, and through the 'safety first' methods we have derived a great benefit; less accidents, better conditions, and all methods of safety practice underground and on the surface, and we are still trying to better 'safety first' methods wherever it is needed, for the benefit of all.

HARRY S. CORDELL.

Grass Valley, California, November 8.

[We are glad to publish this letter, but we demur to the sweeping generalization made by our correspondent, for he knows, as we do, that many of those not speaking English are excellent miners, particularly the Piedmontese.—EDITOR.]

WITH the cession of Alsace-Lorraine to France, Germany loses the rich potash deposits of Alsace, and with them the potash monopoly of the world, according to the 'Vossische Zeitung'. The potash deposits extend 16 kilometres (9.9 miles) to the north of Mühlhausen, over a surface of more than 180 square kilometres (69 square miles). They are unusually rich in potash salts, much richer in fact than the beds in the interior of Germany. They are, moreover, easier to exploit. Their thickness ranges from 3.7 to 5.4 metres (12.1 to 17.7 feet). The thickness of the smaller beds in the upper layers varies from 0.8 to 1.5 metres (2.6 to 4.9 feet). The first workings were begun in 1909; in 1913 there were 12 in operation. In a period of only three years the production rose from 42,420 to 287,000 metric tons, so that the production of potash in Alsace in 1913 was already one-fifth of the entire German output. The total capital invested in the potash works of Alsace amounted to 34,400,000 marks (\$8,187,200 at normal exchange). The production of these workings, it is calculated, would supply the world's requirements of potash for 250 years.

Technical Operations on the Suan Concession, Korea — III

Design and Equipment of the Tul Mi Chung Mill.

By A. R. WEIGALL and J. F. MITCHELL-ROBERTS

GENERAL.—There are two mills on the Concession; one at the Suan mine and the other at Tul Mi Chung.

The Suan mill consists primarily of a stamp-milling and table-concentration plant with an accessory flotation equipment of later date. The first section of this mill, consisting of 20 stamps, was erected in 1909. In the following year 20 stamps were added, and in 1913 flotation was introduced. The mill has a capacity of about 8000 tons of ore per month.

The Tul Mi Chung mill was erected in 1915. In this plant Hardinge mills were employed in place of stamps and the mill is primarily designed for flotation concentration. Accessory amalgamation was included in the flow-sheet but, after eighteen months' trial, was eliminated. The product of this mill consists principally of flotation concentrate with small amounts of table-concentrate from concentrating tables added at a later date. The mill has a capacity of about 14,000 tons per month.

When the Suan mill was designed, the main object was the saving of the gold in the ore. At that time the small amount of copper present, averaging about 1%, was thought to be too low to form an asset of any importance and the presence of 0.1% of bismuth was not taken into account at all. In this mill amalgamation was expected to save the gold and the table-concentration plant was added with the object of saving as much as possible of the gold that was not caught by amalgamation in the form of a gold-silver-copper concentrate, which was shipped to a smelter. After the mill had been in operation for some time the presence of appreciable amounts of bismuth in the top streak on the concentrating tables was noticed and this portion of the concentrate was saved as a separate product. Up to 1913, when flotation was introduced, the average percentage of recovery in this plant was gold 84%, of which 75% was saved by amalgamation, copper 29%, and bismuth 26%. The small amount of silver in the ore, about half an ounce per ton, was not included in the mill figures. After the introduction of flotation in 1913 the gold and copper extractions were increased to slightly over 90% and the bismuth extraction increased to about 60%. The small amount of bismuth and silver in the ore does not warrant daily determinations of the amounts of these metals in the crude ore, and only approximate figures are available. On an ore of this character the above gold and copper extractions are regarded as being satisfactory, more especially as high transportation charges and the requirements of the smelting plant to which the concentrate is shipped call for a grade of

concentrate of 25% copper or more, and the average grade produced is about 26% of copper.

The average grade of the Suan mill-ore to the end of 1918 was gold \$8.75 per ton, silver 0.6 oz. per ton, copper 0.92%, and bismuth 0.08%.

The Tul Mi Chung mill-ore to the end of 1918 has had an average grade of gold \$6.12 per ton, silver 0.5 oz. per ton, and 0.98% of copper. The main product of this mill is in the form of a flotation concentrate containing gold \$100 per ton, copper 26%, and 9 oz. silver per ton. About 4% of the total mill production is saved in the form of a table-concentrate containing gold \$45 per ton, silver 2 oz. per ton, and 1.5% copper. In this mill the copper extraction is high especially in view of the high grade of concentrate produced, and during 1918 averaged 90.34%. The gold extraction is unsatisfactory, averaging 60%, the figure for 1918 being 58.72%. The tailing is being saved for re-treatment and, as will be seen hereafter, the problem of obtaining a satisfactory gold extraction from this extremely refractory and difficult ore is one that has been the cause of a great deal of experimental work at the mine, in America, and in England. The final decision, after investigating every possible alternative method of treatment, is to increase the table-concentrating equipment by means of which it is expected that the gold extraction can be improved by about 10% and the cyanicides in the tailing will be cut down, and then treat the accumulated and current mill-tailing by simple leaching with cyanide, by which it is expected to recover 70% of the gold in the tailing. The purchase of this cyanide plant, which will have a capacity of 600 tons of tailing per 24 hours, has been delayed owing to the high cost of all machinery and plant and the abnormally high freight-rates.

AT TUL MI CHUNG.—This mill is situated 3300 ft. from the portal of the main adit. The connecting double track, which is of 2-ft. gauge, is laid practically level, there being only a fall of slightly over 3 ft. in the total length. Two-ton (36 cu. ft. capacity) U-shaped cars are in use, two of which form a train and are drawn by a mule.

The design of the mill was based on the test results of samples of ore taken from the developed orebodies, which at that time amounted to approximately 350,000 tons. The following analysis will give a good idea of the class of ore tested:

| | % |
|-----------------------|-------|
| Insoluble | 57.17 |
| Silica, soluble | 0.07 |
| Iron | 4.90 |
| Alumina | 2.15 |

| | % |
|-----------------------|--------|
| Copper | 1.78 |
| Lime | 12.27 |
| Magnesia | 4.40 |
| CO ₂ | 10.16 |
| Sulphur | 2.15 |
| Arsenic | 0.12 |
| Undetermined | 4.83 |
| | 100.00 |

A further analysis of the insolubles show their composition to be:

| | % |
|--------------------------------------|-------|
| Silica | 37.84 |
| Al ₂ O ₃ | 2.23 |
| Fe ₂ O ₃ | 5.59 |
| CaO | 7.26 |
| MgO | 2.89 |
| Alkalies | 1.00 |
| | 57.17 |

All the preliminary tests brought out the paramount importance of fine grinding, owing to the ore-minerals being in an abnormally fine state of division. Water-concentration did not yield a satisfactory result, owing to the fact that unless all the ore was ground finer than 100-mesh (Tyler standard) the middling product still contained the bulk of the valuable contents. Owing to the distance of the mines from the railroad, it was essential to produce a high-grade concentrate, and flotation presented the easiest method of recovery of the very fine mineral.

Although about 70% of the gold was recovered in the tests by flotation, amalgamation prior to flotation did not appreciably increase the recovery. Cyanidation after flotation, however, showed that part of the gold unrecoverable by flotation or amalgamation could be saved.

It being considered injudicious to proceed with the design of a cyanide plant to treat the tailing before the exact results of milling were known, it was decided that amalgamation plates could be added at a slight extra cost. The mill therefore was designed for fine crushing, amalgamation, and oil-flotation, with an estimated capacity of 300 tons per day. It consisted of

1. Grizzly, 4 by 10 ft., bars spaced 3 inches.
2. Primary crusher, 30 by 18 in., set to 3 inches.
3. Revolving screen, 16 by 4 ft., having perforated plates with 1½-in. holes to pass 1-in. cubes, and a section with ½-in. holes fitted with a water-spray to remove adhering dirt prior to hand-picking.
4. Undersize to 7, by 24-in. belt-conveyor.
5. Picking-belt, 36 in. by 60 ft., for removal of waste.
6. Two secondary crushers, 20 in. by 6 in., set to crush to 1 in.
7. Belt-conveyor, 24 in. by 106 ft., over ore-bins.
8. Hand-propelled tripper.
9. Ore-bins of 1600 tons capacity.
10. Three 24-in. adjustable belt-feeders.
11. Three Hardinge conical ball-mills, 6 ft. by 16 in.
12. Three Dorr duplex type C classifiers.
13. Undersize to 16 by launders.
14. Oversize to 15 by screw-conveyor.
15. Three Hardinge pebble-mills, 8 ft. by 36 in.
16. Three Dorr duplex type C classifiers.
17. Undersize to 19 by launders.
18. Oversize to 14 (15 by screw-conveyors).
19. Three four-way cast-iron pulp-distributers.
20. 12 amalgamation plates, 4 ft. by 12 ft., slope 1½ in. per ft.
21. 12 Pierce amalgam traps.

22. Three Kyloe type thickening-tanks, overflow to waste, underflow to 23.
23. Primary M. S. type flotation machine, having 8 boxes 29½ in. by 29½ in., concentrate to 24, tailing to waste.
24. Secondary M. S. type flotation machine, having 8 boxes 16 in. by 16 in., concentrate to dewatering plant, by 25, tailing to 23 by 26.
25. Frenier pump, 54 in. by 10 in.
26. Frenier pump, 54 in. by 10 in.
27. Concentrate drying plant.

The original tests had shown the possibility of producing a 15% copper concentrate with a resultant 0.18% copper tailing. Soon, however, after the plant was in operation, the grade of concentrate was increased to 25% with ease and an equally good tailing resulted.

The amalgamation proved that it could not equal the test results and only about 50% of the amalgamation shown possible by the tests was obtainable. Furthermore the arsenic in the ore had appreciably increased, making amalgamation difficult and practically useless.

As indicating the change that has taken place in the ore since the sample was taken for the tests upon which the mill was designed, the following analysis, which is a composite of the ore treated in the month of September 1918, is interesting.

| | % |
|----------------|-------|
| Silica | 67.07 |
| Iron | 7.45 |
| Alumina | 0.69 |
| Copper | 1.18 |
| Lime | 10.76 |
| Magnesia | 1.43 |
| Sulphur | 1.76 |
| Bismuth | 0.11 |
| Lead | 0.05 |
| Arsenic | 0.37 |
| Zinc | 0.36 |

The arsenic content was originally about 0.12%, whereas now it has increased to an average of 0.36%. This change in the composition of the ore has been accompanied by a change in the association of the gold. Formerly the gold was much more closely associated with the copper minerals (mainly chalcopyrite), which were recoverable by flotation, than with the arsenical minerals, which are not recovered to any great extent by flotation, but with the increase in the amount of arsenic the tendency has been to diminish the association of the gold with the copper minerals and to increase the association of the gold with the arsenical mineral (lollingite) in the ore. This feature has had a marked effect in increasing the metallurgical difficulty of obtaining a high gold recovery, the difficulty being increased by the abnormally fine state of division in which the lollingite occurs.

The ore has contained a fairly constant amount of oxidized copper minerals, averaging 0.03% of copper.

The presence of slime in the pulp was found to hinder the oiling of the sulphide minerals, and tests were carried out with a view to lessening this tendency. After many tests and trials, the addition of caustic soda at the ball-mills was found to improve the recovery. Subsequent tests further showed that the addition of flotation-oils at the ball-mill feed recovered more copper and gold. At this time amalgamation was discarded, and, with a view to putting in concentration tables after flotation

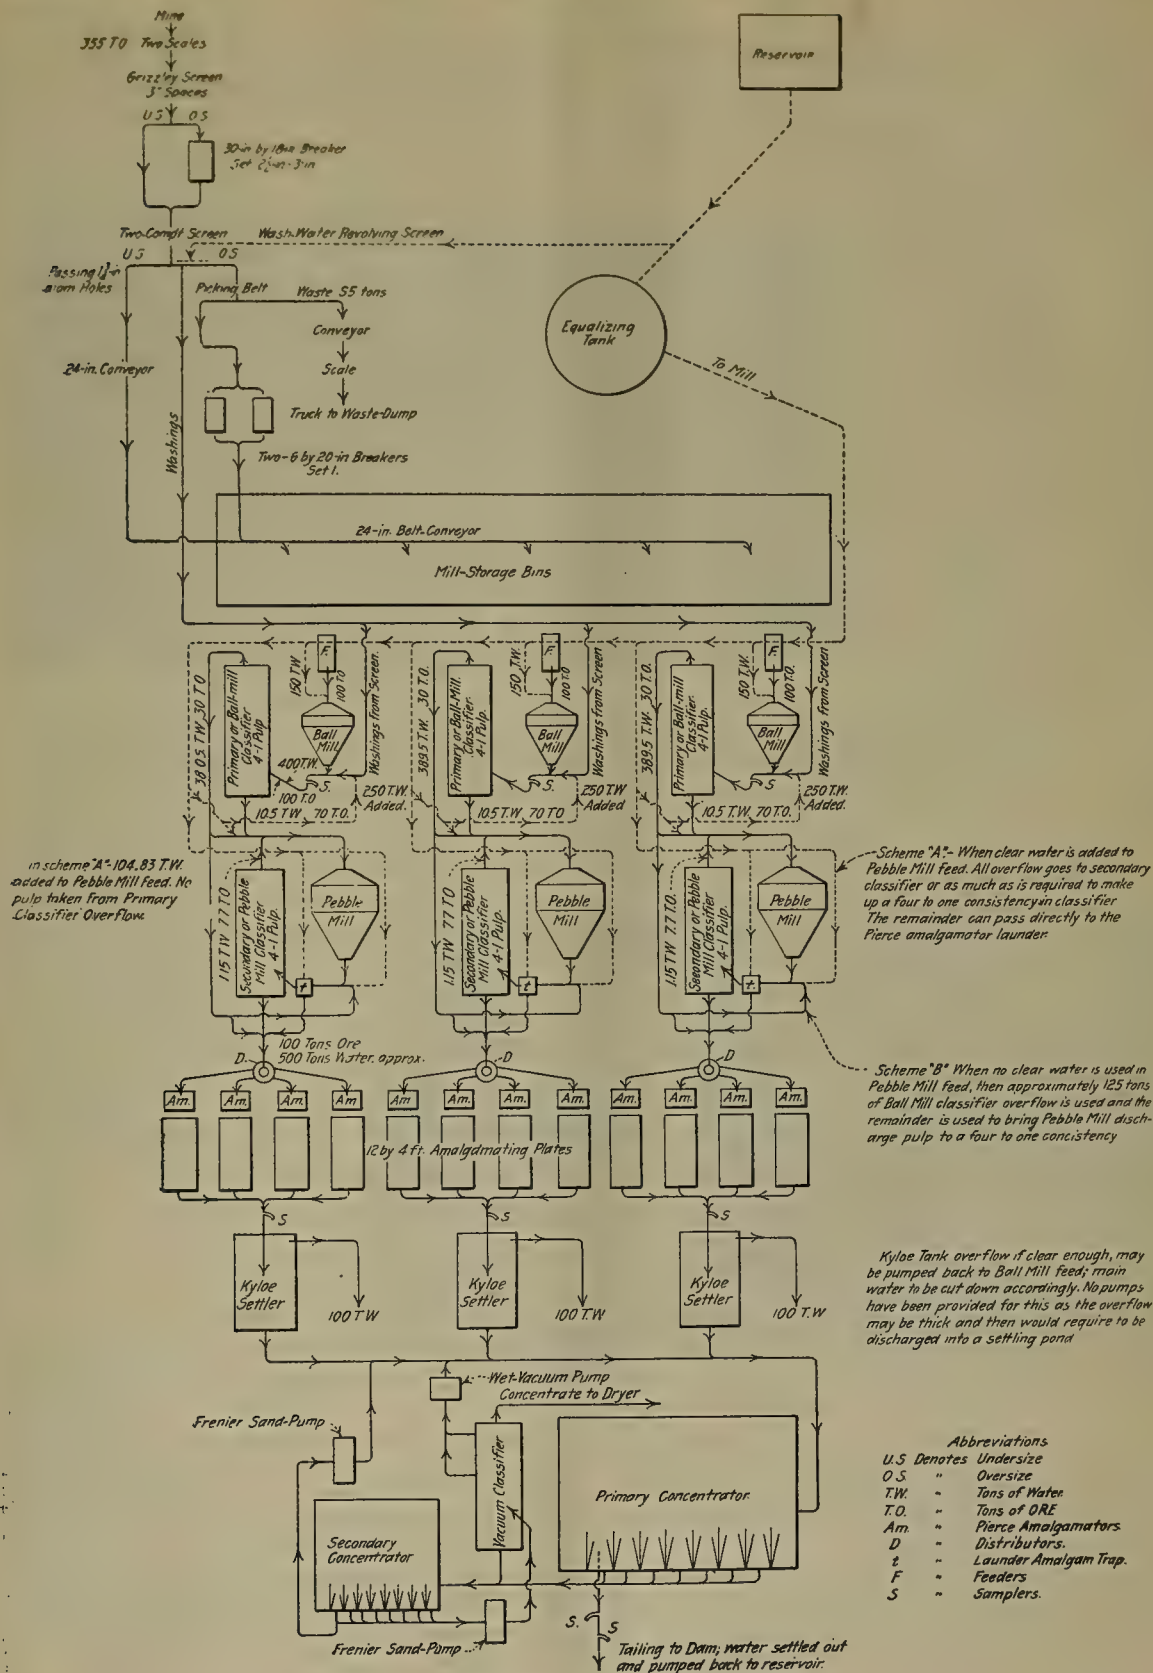

FIG. 4. FLOW-SHEET OF THE TUL MI CHUNG MILL

for the recovery of the arsenic-gold minerals, the amalgamation floor was dismantled and the flotation machines moved up.

After this had been completed, four large Deister roughing-tables were added to treat the flotation tailing. The operation of the flotation plant was also modified as follows: On the primary machine the concentrate from the first five boxes only was sent to the secondary machine, the froth from the remaining three boxes being returned to the primary feed along with the tailing from the secondary machine. The concentrate from the first four boxes of the secondary machine was finished clean concentrate and the concentrate from the remaining four boxes was returned to the secondary feed. To effect a further saving of mineral, all of the tailing from the tables was run over a canvas plant consisting of seven strakes each 7 ft. wide and 40 ft. long. The concentrate from this plant was re-cleaned on the tables in order to enrich the product to an economic shipping grade having a gross value of \$60 or more per ton.

Subsequently this plant was re-modeled and moved closer to the mill. The new plant consisted of twelve cement strakes each 4 ft. wide and 50 ft. long having a slope of $1\frac{3}{4}$ in. per foot.

CRUSHING. The primary crusher and the revolving screen are driven by a 60-hp. motor. The secondary crushers, undersize belt-conveyor, picking and distributing belt over the ore-bins are also driven by a 60-hp. motor.

The estimated capacity of the crushing plant was 40 tons to 1-in. ring per hour. In practice, with one of the secondary crushers only running, the average is 30 tons per hour; and with both crushers running, 60 tons per hour. At times, for short periods on dry free-crushing ore, as high as 90 tons per hour has been accomplished.

At the commencement of operations in this mill the ore immediately gave indications of being troublesome, both from a mechanical and a metallurgical standpoint. As delivered to the mill the ore contains, and specially during the wet season, considerable amounts of the most sticky clay it is possible to imagine. At the same time some of the ore is of abnormal hardness and toughness, from the presence of lime-garnet and tremolite in the gangue, the crushing of which, especially when in large blocks, throws heavy strains on the crushers. The mechanical difficulties in handling an ore of this type can readily be imagined, and special provision had to be made to prevent the clay masses from choking the crushers and chutes. So unctuous was this clay that if it was thrown against the roof it adhered. This difficulty with clay was mainly overcome underground, by preventing as much water as possible from entering the chutes, and by arranging to send to the mill alternate cars of wet and dry clean ore, which cut out the clay accretions on the crusher-jaws.

Owing to the excessive hardness and toughness of the ore, the swing-jaw of the primary crusher, without warning, snapped in two early in January 1917, after it had been in service only 14 months. The break was clean,

the fractures showing no signs of flaws or blow-holes. This casting was too large for the mine foundry and the delay in sending it to the nearest foundry capable of making a casting of this size would have seriously reduced the output of the mill. After discussing various alternatives, the master mechanic, C. S. Crowe, undertook to build a temporary jaw of $\frac{1}{2}$ -in. steel plates with oak-packing between. This jaw was built and in operation one week later. So satisfactory has this jaw proved in operation that after two years of steady and satisfactory service it remains in excellent condition, having in this period crushed over 300,000 tons of ore. Subsequently similar breakages took place in the secondary crushers, and similar built-up jaws have been made to replace the former cast-iron jaws. They are giving such satisfaction that the use of further cast-iron jaws has been abandoned. The jaws cast locally for the secondary crushers have only lasted two months. See Fig. 1 and 2.

Special mention has been made of this matter, as it may be found of use in the case of other mills similarly situated far away from foundry facilities, and as the jaws can be made in a small machine-shop and the materials entering into their construction are such as are usually stocked at any mine.

SORTING. Originally it was thought that about 15% of the barren waste could be hand-picked from the ore, and for this purpose a washing compartment was provided in the revolving screen ahead of the picking-belt. However, contrary to expectations, the amount of waste that could be hand-sorted has never exceeded 2% and consequently water is not now used on the screen, which serves only to separate the minus 1-in. material.

The discarded waste contains little value; it averages gold 50c. per ton and a bare trace of copper. It consists principally of clean limestone. On the other hand, the picking-belt is useful in enabling tramp iron, steel, and wood, as well as Korean straw shoes, to be removed from the ore before entering the secondary crushers.

GRINDING. This part of the plant is arranged in three units, each of which is equipped as follows:

- 24-in adjustable belt-feeder;
- Hardinge ball-mill, 6 ft. by 16 in.;
- Dorr duplex type C classifier;
- 9-in. cast-iron spiral conveyor;
- Hardinge pebble-mill, 8 ft. by 36 in.;
- Dorr Duplex type C classifier.

One general account will serve to describe the whole plant, as the units are similar and interchangeable in all details.

The feeders, which are of special design for a quick change of capacity without necessitating stopping, are fed from the 1600-ton ore-bin by means of a rack-and-pinion gate 18-in. by 24-in. The three feeders are operated from a common line-shaft driven by a 5-hp. back-gear motor. Special mention is made of this feeder as it has proved highly efficient under a great variety of conditions, from perfectly dry free-running ore to the most unctuous sticky variety. These feeders have been

in continuous operation for the past three and a half years, during which time they have handled over 450,000 tons of ore with practically no repairs. Each belt will last for over 100,000 tons of ore. See Fig. 3.

The feed falls directly into the feed-box of the Hardinge ball-mill along with the requisite amounts of

ering a period of one year, the following figures were obtained for the average ore milled:

| | Gold per ton | Copper % |
|----------------------------|-----------------|-------------|
| Head value of ore | | |
| By assay of ball-mill feed | \$6.33 | 0.89 |
| By products plus tailing | 6.35 | 0.82 |

The ball-mills are provided with single scoops of the

usual type with renewable cast-steel tips of a serrated pattern. The linings are of cast-chrome steel and five-inch forged chrome-steel balls are used. The life of the linings is good for 30,000 tons, and then only the feed end and cylindrical belt-linings require renewals, the remainder of the linings being good for 50,000 to 60,000 tons. The wear of liners per ton of ore milled amounts to an average of 0.208 lb. and the steel-ball consumption averages 0.47 lb. per ton milled. Each mill carries a charge of 10,000 lb. of balls, additions being made daily.

Each mill is direct driven by a 60-hp. 432 r.p.m. motor,

through a flexible coupling and eight-inch face double-helical cut-gear 2½-in. diametrical pitch. The gears are whole, and of cast-iron; the pinions are cut from the solid shaft. The motors are mounted on an extension of the discharge-end base-plate, making the whole arrange-

water, caustic-soda solution, and eucalyptus oil. Head samples are taken at the feeder discharge over a period of 15 seconds every hour, and, after drying, the average weight of these samples is used to calculate the amount of ore treated per day. The figure obtained closely checks the actual weight of ore delivered to the mills as recorded at the weigh-bridge at the head of the plant. Usually the difference is less than 0.25% per month.

To test this point an investigation has recently been made covering the last 12 months. The result showed that on a quantity of 151,129 tons as given by the weight of ore delivered to the mill less the weight of the discarded waste, and moisture deduction, the feeder-weights checked with the delivery figure within a difference of 251 tons. Other monthly tests have confirmed the accuracy of an hourly 15-second feed sample taken at each mill-feeder. Each shift-sample so obtained is subsequently used to determine the average grade of the ore milled.

The final average grade of the ore milled is determined by the value contained in the products plus the value discharged in the tailing. A close agreement is obtained with the estimated grade of ore milled. For instance, in the previously mentioned investigation cov-

ment solid and secure. The motor-frames are of the ordinary 120-hp. size and heavily wound to withstand the excess starting torque required by the mills.

The discharge cone is provided with a half-inch aperture heavy-wire cylindrical screen, which delivers any oversize discharged from the ball-mills directly into the feed-box of the succeeding pebble-mill. The undersize product from the screen, with additional water,

flows to the primary classifier. The overflow product from this classifier is -100 mesh and is laundered to the discharge of the pebble-mill (see flow-sheet Fig. 4).

The oversize product of the primary classifier, along with the oversize from the closed secondary-classifier circuit, is delivered by means of a nine-inch diameter spiral conveyor to the feed-box of the pebble-mill. This conveyor is driven by a No. 78 chain from an extension of the primary-classifier driving-shaft. The renewable interlocking flights for these conveyors are cast at the mine-foundry and last from 30 to 40 days.

The pebble-mills are driven in a similar manner to the ball-mills. These mills were originally lined with chert, owing to the fact that, at the time the mill was erected, silix was unobtainable, the source of supply at Mons being cut off. Further supplies of chert not being obtainable, owing to the great increase in the freight-rates to the Orient, a local substitute in the form of blocks of extremely hard ore from the Suan mine was employed. Subsequently, on the depletion of this source of supply, hard dolerite, which occurs in the vicinity, was found not only a cheap but an excellent substitute.

After considerable experimenting with various forms of lining, the dolerite with interspersed cast-iron lifting-bars, generally similar to those used at the Liberty Bell mine, in Colorado, were adopted. These bars are spaced 15 inches on the cylindrical part of the mills and proportionally elsewhere. A spare shell is kept on hand, half-lined only, as the crane capacity was designed to lift a silix-lined mill and is insufficient to lift a mill completely lined with seven-inch dolerite blocks and the cast-iron lifting-bars. A mill is replaced and in operation again within a shut-down of 24 hours. The change and relining of half the mill consumes 12 hours. As soon as the mill is lined, live steam is turned into it and 12 hours later the mill is again in operation.

Formerly a supply of Danish pebbles was furnished, but on this supply being consumed, local pebbles obtained from the shores of the islands off the coast of Korea in the neighborhood of Chemulpo and Mokpo were used until recently, when experiments with roughly rounded five-inch dolerite blocks were made, proving so satisfactory that they are being adopted.

The pebble consumption has varied considerably with the class of pebbles obtainable. With Danish pebbles the consumption averaged about 2.3 lb. per ton of ore milled,

whereas with Korean pebbles the consumption rose to 5 to 7 lb. per ton; but even with the increased consumption the Korean pebbles proved much cheaper than imported pebbles. Dolerite pebble consumption would appear to be about 4 to 6 lb. per ton of ore milled and will cost less than half the previous price of Korean pebbles. The fineness of the product has remained practically the same with all varieties of pebbles used.

With the object of lowering the power consumption of the pebble-mills, they are provided at the discharge-cone with a revolving slotted diaphragm, enabling the pebble load to be maintained well above the centre of the mill without 'belching out' the overload. The normal pebble load under these conditions is approximately 14,000 lb. as against 11,000 lb. for mills not so equipped. A newly-lined mill requires about 55 hp. to operate it, and this consumption of power increases as the lining becomes worn until at the time of re-lining the power required is nearly 70 hp.

The discharge from the pebble-mill together with the overflow from the primary classifier, as well as some extra water, flows to the secondary classifier. The pulp consistence in this classifier is maintained at about 1 part ore to $2\frac{1}{2}$ to 3 parts water, so that the final overflow varies between 1 part ore and 3 to $3\frac{1}{2}$ parts water. At this consistence the pulp flows directly to the flotation plant.

Trouble was experienced owing to the presence of wood chips, etc., getting into the flotation machines. This difficulty was overcome by inserting a screen under the discharge of the secondary classifiers, in full view of the attendants.

The classification of this ore presents a difficult mechanical problem owing to the fact that some of the gangue is composed of garnet of high specific gravity and the remainder is composed of relatively light gangue-minerals. The difficulty is augmented by the presence of much colloidal gangue-slime. Unless the pulp dilution is maintained constant, the density of the pulp is insufficient to buoy over the minus 100-mesh garnet particles. On the other hand, should the density be too high then the coarse relatively lighter minerals flow over, giving an excess of oversize. To adjust these conditions to a nicety requires long practice and constant attention and even then marked changes in the character of the ore occur not only from day to day but from hour to hour, necessitating constant vigilance.

FIG. 5. PLAN AND SECTIONAL ELEVATION OF THE TUL MI CHUNG REDUCTION PLANT

FIG. 3. GENERAL ARRANGEMENT OF BELT FEEDER AT THE TUL MI CHUNG MINE

In both ball and pebble mills the dilution is now maintained at approximately 33% of water.

As to fineness, the aim has been to reduce the ore so that the feed to the flotation plant does not contain more than 10% oversize on a 100-mesh screen. Further, the extraction varies almost directly with the percentage of -200 product in the pulp. In order to maintain a high grinding efficiency, hourly screen-samples are taken on each unit, and for these analyses the Rotap screen has proved itself invaluable.

The classifiers in the mill are operated from a common line-shaft driven by a 5-hp. 1190 r.p.m. motor.

No water-wash over the rakes is used in the classifiers, which accounts partly for the amount of minus 200-mesh material in the classifier returns. This material consists for the greater part of garnet, its presence there being due to its high specific gravity.

At the time the grinding scheme was designed little was known of the grinding qualities of the 8-ft. ball-mills, the only installation at that time being in Sweden and operating on iron ores. The experience since gained has shown that, when operating upon a hard and tough ore, the 6-ft. mill does not produce sufficient grinding effect unless the ore is crushed small. Better results would have been obtained by having the mill in one unit, using one 8-ft. ball-mill and two similar mills of the same size re-grinding with smaller balls. The power consumption would have been the same and the tonnage output would have been increased, or, with a reduced tonnage, grinding to a finer degree would have been practicable. The results are well illustrated by the work done in the new units in the Miami Copper Co.'s mill, in Arizona.

FLOTATION. The flotation plant comprises two machines of the M. S. type, each driven by separate motors. The primary machine is of eight boxes, 29½ in. square with eight spitzkastens. It is belt-driven by a 60-hp. motor. The illustration shows the original machine, to which subsequently another spitz-box was added in front of the first agitating-box. This change was made when the flotation oils and reagents were added at the ball-mills instead of adding them to the pulp as it entered the machine, after coming from the amalgamation plates.

The secondary machine is similar in all general details and has eight boxes each 16 in. square. It is belt-driven by a 20-hp. motor. It serves to clean the primary froth-concentrate.

These machines were among the first to be driven by gearing; and, in order to safeguard the continuity of operation, phosphor-bronze gears (20 and 19 teeth) were provided. In practice these gears are run in a medium heavy grease and have proved eminently satisfactory, operating almost noiselessly. After four years of constant service they show practically no sign of wear. The use of phosphor-bronze gearing is to be strongly recommended.

Among other features of more than general interest may be mentioned the use throughout of ball-bearings. The main driving-shaft is in sections, each section driving two impeller-shafts. These individual sections of

shafting are connected by means of concentric couplings, which allow any particular section of the shaft to be removed without disturbing the remainder. This detail is a great convenience.

The flotation machines, as stated above, being the earliest gear-driven machines made, full advantage was not taken in their design of the method of absorbing the end-thrust by having adjacent spindles revolve in opposite directions, consequently a thrust-ring (ball) is employed on the end bearing. Drawing of the flotation-machine will accompany the description of the flotation plant in the Suan mill, to be described in the next article.

The primary machine was designed for a capacity of 250 to 400 tons per day; but with the fixed pulp dilution of 3:1, or 3½:1, no difficulty is experienced in handling 600 tons of ore per day. The only modification made as the tonnage increased was to enlarge the pulp-passes between the agitating and spitz-boxes to 20 by 2 in., which opening is satisfactory. Cast-iron lips are used to protect the edges of these apertures.

Formerly the agitating-boxes were wood-lined, but later cast-iron liners have been used. They give a minimum of trouble.

The agitating spindles revolve at a speed of 300 r.p.m. and are provided with impellers 21 by 3 inches.

For the removal of froth, the usual revolving paddles are employed.

After considerable experimentation the machine is now operated as follows: Boxes No. 1 to No. 5 produce froth for the secondary re-cleaning machine, to which machine it is sent by a centrifugal pump (Krogh 2-in. slime-pump). The remaining three boxes are run with a rapid overflow, to ensure the removal of all the froth produced. This product is pumped back to the primary feed by another centrifugal pump for further agitation. The primary machine also receives the return tailing from the secondary re-cleaning machine.

| Box No. | Primary Machine | | Secondary Machine | |
|---------|-----------------|-------|-------------------|-------|
| | Gold | | Copper | |
| | dwt. per ton | % | dwt. per ton | % |
| 1 | 64.40 | 23.00 | 64.00 | 23.40 |
| 2 | 75.40 | 19.70 | 71.20 | 24.80 |
| 3 | 86.80 | 15.20 | 75.20 | 20.60 |
| 4 | 86.80 | 12.00 | 73.60 | 18.50 |
| 5 | 74.80 | 10.80 | 61.20 | 15.80 |
| 6 | 10.10 | 2.00 | 44.40 | 10.90 |
| 7 | 11.60 | 1.10 | 53.00 | 9.60 |
| 8 | 15.80 | 1.50 | | |

To provide against flooding and choking caused by the sudden stoppage of power, an emergency launder is provided by means of which the flotation machine can be immediately short-circuited and emptied into a sump. The secondary machine is used solely for re-cleaning and enriching the grade of concentrate produced by the primary machine.

In current practice boxes No. 1 to No. 4 are operated to produce a finished clean concentrate; boxes No. 5 to No. 8 produce a concentrate that is fed back to the first box. The last four boxes are only overflowed at a moderate rate, as the tailing from this machine is returned to the primary machine for further treatment. The capacity of this machine is from 50 to 75 tons per day; it seldom receives more than 40 tons per day of primary

concentrate. No additional oils or reagents are added to the secondary machine. The effect of the addition of various reagents and oils has been tried, but without beneficial results.

The final concentrate is laundered with additional water to a Dorr thickening-tank 30 ft. diam. by 10 ft. deep. The overflow water from this tank is piped back to the pump elevating the primary concentrate to the secondary machine and serves to equalize the feed and volume of the circuit.

The thickening-tank is provided with a sheet-steel annular baffle of 6 ft. diam. by 3 ft. deep, suspended so that it is 27 in. under the surface of the water. This baffle surrounds the central axis of the tank and the concentrate is laundered so as to fall almost in the centre of the baffle. A fine jet of water at high pressure is allowed to play on the concentrate as it touches the surface of the water in the tank. This method of breaking down the froth is very satisfactory; it is probably assisted by the presence of caustic soda in the mill-water. The overflowing water carries little, if any, suspended mineral, and should at any time froth break away and overflow, it is again caught in the flotation circuit.

The thickened concentrate contains about 30 to 35% of moisture and is withdrawn periodically from the bottom of the tank through a 1½-inch plug-cock into 1 ton (20 cu. ft.) U-shaped water-tight cars and trammed to the drying-house by hand.

TABLES. The primary flotation tailing runs to a four-way distributor and is laundered thence to four large Deister roughing tables. Each of these tables handles from 100 to 125 tons of tailing per 24 hours. To prevent a heavy cross-flow of the pulp when handling this tonnage, every sixth riffle is doubled in height up to the cleaning plateau, and by this means a satisfactory segregation of mineral particles is possible.

The primary object of the tables is to recover the iron-arsenic-gold minerals, which are only slightly susceptible to flotation, and to act as a safeguard against loss of copper mineral that may have escaped flotation. Naturally, the product of the tables varies considerably with the grade of ore being milled. Free gold, which is rare, is saved on the tables along with the arsenical minerals.

The average value of the table-product is about \$60 gold per ton and 3 oz. silver with 1.5% of copper and 8% arsenic. However, at times, the grade has increased to \$150 gold per ton, the other constituents remaining practically the same. A separate sample of the lollingite streak on the tables always runs high in gold, and samples taken have shown \$1800 per ton without visible gold being seen, even under high magnification. The arsenical minerals invariably occur in an extremely fine state of division and all will readily pass a 200-mesh screen. The abnormal fineness of these minerals and their high gold-content constitutes one of the main difficulties in securing a good extraction of the gold. To completely free all arsenical minerals from the gangue, it would appear necessary to grind to a fineness that is not economically practicable.

With a view to possible subsequent cyanidation of the mill-tailing, it has always been the practice, in operating the table plant, to remove as much as possible any cyanicides in the ore.

Table concentration on the fine product separates out all the abraided iron from the ball-mill grinding. The ore contains also a considerable amount of magnetite, which still further dilutes the concentrate. As much as 33% of the table-concentrate is made up of magnetic particles carrying low gold-values, to remove which a new system of magnetic concentration is being tested. Another diluent of the concentrate is the iron-lime garnet constituent of the gangue, which is invariably present in excess of 15%. The high specific gravity of this mineral tends to throw it well up into the other mineral streaks on the concentrate end of the table and it can only be cut out at the expense of sending a considerable amount of the other minerals into the tailing. At one time it was thought that by cutting out this garnet streak separately and cyaniding the product, an economical recovery of the contained gold would be possible. After repeated experiment, the proposal had to be abandoned on account of the high cyanide consumption. The table concentrate is collected in boxes and periodically shoveled into cars, to be trammed to the drying-house.

RE-GROUNDING. In order further to liberate the unreleased minerals in the table-tailing, it was decided to re-grind the coarser particles. To effect the separation, after a thorough trial of older methods as well as attempting to utilize the tables themselves as classifiers, it was decided to use a Dorr bowl type of classifier. The great difficulty of efficient classification on this ore, as previously mentioned, lies in the relatively high specific gravity of some of the minerals of the gangue and the relatively low specific gravity of the remainder.

For re-grinding an Allis-Chalmers ball granulator, 5 ft. by 5 ft., is employed, using concave and plain 1½-in. diam. cast-iron balls. A 10-hp. motor serves to operate the bowl classifier as well as the 3-in. closed runner Byron Jackson centrifugal pump, which returns the re-ground product to the primary-flotation feed. For the ball-granulator, a direct-connected 75-hp. Allis-Chalmers motor is used, which, however, only consumes on an average 50-hp. to operate the mill.

The bowl-classifier is operated at 15 strokes per minute. So dense is the oversize in the bowl that if the power is off, even for one minute, it sets so hard as to necessitate digging it out before the machine can be re-started. Two systems of water addition have been tried, firstly the usual practice of adding it above the rakes, and secondly a double water-uptake through the connecting orifices between the bowl and the rake-tank. The latter method has given us the cleaner product and seems eminently satisfactory.

The bowl of the classifier serves also as a froth-trap. Suspended above the surface is placed a deflecting baffle-board, which skims the froth and directs it into a pipe connecting with the re-grinding mill discharge, and by adjustment of the amount of water flowing out with the

froth, the density of the re-ground tailing is kept constant.

In the re-grinding mill the best results are obtained on a dilution of 30% water. Worn-out balls and concavex pebbles that finally work out of the mill through the gratings are caught on a $\frac{1}{4}$ -in. heavy wire-screen placed in the discharge-box.

The liners in this mill seldom last over five months and we have had linings that were worn out in three months. The heaviest wear appears to be upon the feed-end headlinings. The ball consumption has averaged about 0.4 lb. per ton of ore treated or approximately 2.4 lb. per ton of tailing re-ground.

Screen-Analyses

| Mesh | Feed. % | Product. % |
|-------------|---------|------------|
| On 65 | 4.0 | 0.0 |
| 100 | 26.0 | 5.0 |
| 150 | 32.0 | 12.0 |
| 200 | 13.0 | 9.0 |
| -200 | 25.0 | 74.0 |

SLIME-PLANT. This plant is situated about 200 ft. from the main mill-buildings. The overflow from the bowl-classifier is pumped over by means of two direct-connected 4-in. Krogh centrifugal pumps—each operated by a 10-hp. motor. The difference in elevation between inlet and outlet is approximately 22 ft. and the total tonnage handled daily is approximately 3600 tons of tailing and water (1:7 dilution), the additional water resulting from the tables and bowl-classifier.

The pulp is distributed over 12 cement strakes, each 4 ft. wide by 50 ft. long, the inclination of which is $1\frac{1}{2}$ inch per foot. This inclination has been found to be too steep, and better results were obtained with a slope of $1\frac{1}{4}$ inch per foot.

The strakes are made of a bed of 3 to 6 inches of concrete, tamped level (horizontally) upon which a dressing of $\frac{3}{4}$ inch of 1:1 cement mortar is carefully troweled. When this is nearly dry, a small amount of dry cement is dusted on and again troweled. After this the strake is carefully combed transversely, thus forming a finely riffled surface. The wire-comb used should have teeth about $\frac{1}{8}$ inch apart. After setting for three days, the strake is ready for use.

One man attends to each four strakes and washes them down with a hose in sequence. The tailing is laundered to the final dump and the concentrate is returned to the mill by a 2-in. Krogh slime-pump. The concentrate is re-cleaned on a Deister Simplex finisher table, the concentrate being mixed with the other table-concentrate and the tailing joins the other table-tailing.

The saving in the slime-plant is about 10 cents per ton. To increase this saving, numerous table-tests have been carried out; Deister slime-tables, Union vanners, and Overstrom Universal tables have all been tried. So far the best results, when saving and capacity are jointly considered, have been obtained with the Overstrom Universal table.

Each machine saves practically the same amount per ton, namely, 30 to 50c. per ton, dependent upon the grade of tailing being treated, but in capacity the Overstrom table is ahead of the Deister slime-table or the Union vanner on this material.

DRYING-HOUSE. Situated 100 ft. from the bottom of the main mill-building, the drying-house is connected to the flotation-concentrate thickener, and the concentrating-floor by 2-ft. tracks, which run the entire length of the building.

To provide a simple and efficient means of drying the concentrate before sacking and shipping, a special type of drying-floor is employed. Each furnace heats a floor 15 by 40 ft.; two fire-boxes are built together; similarly, two stacks are built in one. Underneath the floors are staggered brick baffles, built 24 in. on centres, forming one long flue 330 ft. from the bridge of the fire-box to the top of the stack.

The floor proper is composed of concrete slabs, which are reinforced by using four-point 4-inch barbed wire made up into 3-in. openings, and set $\frac{3}{4}$ inch from the underneath side of the slabs, which are $2\frac{1}{2}$ in. thick. The concrete is made of a mixture of 1:2:4, using washed sand and $\frac{3}{4}$ -in. gravel, hand tamped into wooden molding-boxes. The edges of the slabs are cast with a ship-lap joint to prevent concentrate penetrating through to the flues when dry.

The floor slopes toward the stack end of the floor, where the concentrates are dumped wet, at a slope of $\frac{1}{4}$ in. per foot with the exception of the last three feet, which slopes at one inch per foot to provide for quick drainage of the settled water. For this water, a drain runs the whole length of the building and empties into a trap.

The cars are dumped directly onto the cool end of the floor and allowed to drain. As the concentrate dries, it is gradually raked by hand to the upper or fire-box end of the floor until dry. Here the dry concentrate is sacked hot, sampled, the sacks sewn up and weighed ready for transport by bull-carts to the railroad, 45 miles away.

The fuel consumption averages one cord of wood (inferior and probably not more than $\frac{5}{8}$ of the U. S. cord) for every four to five tons of concentrate per annum, which covers a wide range of temperature. Winter months require about one cord for three tons, whereas in summer one cord will dry six tons.

The final moisture in the dried and sacked concentrate averages 0.3% regularly.

In isolated localities with a reasonably cheap fuel and labor supply, this system of drying flotation concentrate has much to recommend it, as the whole plant can be constructed of local material cheaply and the maintenance is practically confined to the yearly renewal of a few concrete slabs that are immediately exposed to the heat of the fires. The building being enclosed and the concentrate being delivered to it in a wet condition, the loss from dusting is practically nil.

The method of heating the floor is a copy of the method used by Koreans and Chinese to heat their houses, and the fuel economy is a tribute to Chinese thrift. This method of heating has been adopted with success in foreign dwelling-houses, and when these floors, or *kangs*, as they are called locally, are designed carefully they will keep a house warm in the coldest climate with a minimum fuel consumption, as compared with stoves or other methods of heating.

In the original construction of the drying-floors at Tul Mi Chung, insufficient allowance was made for the expansion of the whole floor when heated, with the result that one of the end-walls of the building was dislodged about three inches. Subsequently allowance for expansion was made by providing a space of six inches all round the slabs at the sides and ends, filled with loose dry tailing, and this obviated any further difficulty from this cause.

The cost of drying concentrate by this method, including sacking, sampling, sewing, and weighing is 90 cents per ton of dry concentrate with wood at \$2.25 per cord and labor at 25 cents per day of 10 hours. The cost of the concentrate drying-house at Tul Mi Chung amounted to \$8194.93.

The capacity of this drying-house depends on the fineness of the concentrate. At Tul Mi Chung the flotation concentrate is extremely fine and 97% of it will pass through a -200 screen. The table-concentrate, which only forms a small proportion of the material sent to the drying-house, is much more rapidly dried. On flotation concentrate the capacity of the drying-house, which consists of six floors, is from 30 to 35 tons per day. With the addition of the coarse and more granular table-concentrate the rate of drying would be increased.

POWER CONSUMPTION. The following tabulation shows the actual power consumption for each section of the mill, calculated over the year 1918, in which period 154,300 tons of ore was milled.

| Section | Kw-hr. per ton |
|--------------------------------|----------------|
| Crushing and sorting | 1.8018 |
| Grinding and classification | 14.9446 |
| Flotation and pumps | 2.8027 |
| Tables | 0.2323 |
| Re-grinding and classification | 2.4231 |
| Tailing-elevating | 0.7769 |
| Slime-plant | 0.2400 |
| Total | 23.2214 |
| Water-supply | 2.0169 |

MILL-LABOR. Each shift is under the supervision of a foreign shift-boss, and the whole mill is under the direction of the mill-superintendent.

The distribution of labor is as follows:

| | | |
|-------------|---------------------|----|
| Crushing | Two shifts of 9 men | 18 |
| Sorting | Two " " 4 boys | 8 |
| Feeders | Three " " 1 boy | 3 |
| Grinding | Three " " 4 men | 12 |
| Classifiers | Three " " 3 men | 9 |
| Flotation | Three " " 1 man | 3 |
| Regrinding | Three " " 3 men | 9 |
| Tables | | |
| Slime-plant | | |

Accessory labor comprises laborers, sampler, and interpreter, bringing the whole crew up to 71 natives.

The motors are under the charge of Japanese electricians, one man being detailed to each shift with a Korean helper.

COST OF MILLING. The following tabulation shows the cost during 1918. In this year, owing to the effect of war conditions, all costs were increased above the average of previous years, and, doubtless, with the resumption of more normal conditions, future operating costs will show a reduction. As one instance of the manner in which operating costs were affected, the cost for power per ton

milled in 1918 increased 68% over the corresponding cost for the previous year. The following cost includes all foreign supervision.

| Tul Mi Chung Mill Cost Per Ton Milled, 1918 154,300 tons milled | | | | |
|--|----------------|-------------|-------------|-------------|
| Department | Supplies \$ | Power \$ | Labor \$ | Total \$ |

Present Problems of the Mining Industry

By Van H. MANNING

*It is a pleasure to be again in the city of St. Louis and to speak before the American Mining Congress, for my memory at once brings back vividly those days, 15 years ago now, when my honored late chief, Dr. J. A. Holmes, was with the help of his colleagues, Messrs. Campbell and Parker, beginning here in St. Louis the fuel-testing work in connection with the Louisiana Purchase Exposition that later led to the creating, first, of a technologic branch of the U. S. Geological Survey, and, later, to the establishing of the Bureau of Mines, of which he was the first Director, and to which the memory of his wise leadership and far-seeing vision will always be an inspiration. I remember too that two years previous to that he had been chairman of the committee on permanent organization of the International Mining Congress, as it was then known, when it met at Butte in August 1902 to devise some means by which its work could be made of greater value to the mining industry and lay down the basis of a permanent organization toward that end. The Bureau of Mines and the American Mining Congress therefore both owe to this one great man the formulation of wise policies and the outlining of great aims that have borne fruit in the continued growth and greater usefulness of them both. They are linked together too in the undoubted fact that the resolutions passed at the meeting in Butte, as well as in preceding and later meetings, stating that on account of the importance to the country of the mineral industry a Federal Department of Mines and Mining should be created, greatly facilitated securing the appropriations that made possible the establishment of the Bureau of Mines in 1910.

When I have appeared before you in former years it has been my custom to speak to you briefly of the work of the Bureau of Mines, but I no longer feel that that is necessary. In the past decade the aid given by the Federal government toward the encouragement of the mining industry has so far justified itself that the Bureau has been able to extend its work throughout the mining districts of the country, and what it has been doing is doubtless known to you through personal contact with its agencies. I say this the more confidently because of the cordial co-operation the Bureau has received from the men of the mining industry. It cannot be necessary, therefore, to explain and define the Bureau in the house of its friends, and I want to draw to your attention a few of the main general problems that confront the mining industry and to indicate what in my judgment seems to be the most desirable way in which their solution should be attempted.

We are confronted today with what is perhaps the most serious industrial trouble that the United States has ever had. I refer, of course, to the coal strike. It is not my purpose to attempt any discussion of the merits or demerits of the case of either side of the controversy, and I hope, with you all, that the dispute will be settled soon, but since it is the function of the Bureau of Mines to foster the mining industry, I feel it my duty to discuss one problem which has concerned both the miners and the operators in the past, and that is, the frequent periods in which the bituminous mines, especially in the spring and summer months, are not at work from causes not under the control of either the operator or the miner. As you are aware, these unwelcome shut-downs constitute a considerable percentage of the possible number of working days in a year, and thus seriously affect the gross income of both the miner and the operator, since each suffers a loss whenever the mine stands idle. Unfortunately the roof does not stand idle—it falls and must be timbered, and water enters the mine and must be pumped out. These, and other necessary operations cause a loss for which there is no compensation.

In the 5-year period, 1912 to 1916, the time worked in the bituminous mines ranged from 195 to 232 days, out of a possible 310 working days. In 1917 the mines worked 243 days, and in 1918, under the abnormal war conditions, 249 days. In round figures, the mines are idle for one-third to one-fourth the time in ordinary years. The reason is well known to you: the bituminous mines are opened and manned on the basis of the maximum or winter output, which in large part arises because consumers reduce their purchase of coal in the spring and summer.

Although some bituminous coal does not stock well, yet there are ways and means by which this can be done, but it requires careful storage, and the storing and re-handling cost money. The trouble is that the consumer does not perceive the cost of this to himself. He thinks to himself, it is all right for Jones to buy his coal early and in this way help out the miners, but it is going to be inconvenient for me to tie up my money so far in advance, and so he does not order coal early in the season. It must, therefore, be made worth while to the consumer from a money standpoint. If a business firm uses a thousand tons of coal per year and could save a thousand dollars by buying early, is it not likely that it would make its purchases early, although it might have to spend half this amount in re-handling? On the other hand, it would be a further advantage to the company to know that it would have its supply of coal on hand when the winter storms tied up the railroads.

Since Congress by law has prevented agreement among operators as to price, it becomes impossible for them to

*Abstract of an address delivered by the Director of the U. S. Bureau of Mines before the American Mining Congress at St. Louis on November 17.

take care of this situation by agreeing to sell their coal at a loss in summer and making it up in winter. It has been suggested that this could be taken care of through the Government establishing summer and winter rates on coal, so fixed that there would be no loss of net revenue at the end of the year; or, still better, establishing a sliding scale that would produce an equalization of coal purchases and shipments through all the months of the year.

The effect of this would be that the miners would have steady work and there would be readjustment by which fewer mines could furnish the total amount of coal needed. This would not necessarily mean the shutting-down of mines, for coal production in 1918 was 113,000,000 tons, or 20% greater than in 1913, and if new mines were not opened for awhile productive capacity would quickly become adjusted to consumption. Fewer miners would be required, and we would have the advantageous condition in this country, which prevailed in Europe before the War, where the miners worked practically every working day in the year, and the operators were able to count on a regular output.

* * * * *

I cannot overlook this occasion to call your attention to a situation that now exists regarding the international policies in the development of the mineral resources of the nations of the world. A number of countries have recently inaugurated policies tending toward the exclusion of other than their own nationals in the acquisition of mineral resources, more particularly oil, within their own domains and spheres of influence. This is a situation in which all Americans should interest themselves and in which the American Mining Congress should be particularly concerned.

There are two phases of the situation, one with reference to the larger nations, the other with reference to the smaller nations. Mining men are more or less familiar with the situations that exist in Latin-American countries. It is probably not as well understood that the stronger nations have instituted policies which will exclude Americans from acquiring holdings in their domains or spheres of influence on a scale that will encourage our nationals. These policies have been the outgrowth of the recent war and the intense nationalism which has been accentuated by the struggle for existence which the nations have undergone. As a result we find that each nation manifests a desire to meet their own needs first, and these desires are being pushed in a manner that is both short-sighted and, in the end will, in my opinion, react upon itself. This policy has been centred around the petroleum situation because the War has brought home to every nation the vital importance of petroleum in war and in peace. Petroleum as a source of motor-fuel, as a source of the only lubricant that can be obtained in sufficient quantities, and as needed for the marine of the world, both naval and merchant, is becoming one of the primary necessities, militarily and industrially, of our modern world. Up to the present time, the United States has been in a dominant position as far

as petroleum resources are concerned, and has produced from 60 to 70% yearly of the world's total supply, but likewise, the United States with its industrial life promised upon the productivity of each man being multiplied by the use of machinery has come to be a consumer of petroleum and its products in greater proportion than its actual production. We can no longer meet our domestic demands from domestic resources, and our best engineering talent tells us that looking both from a question of supply and from the question of demand, the situation will grow progressively more critical until such time as the oil-shales of the West can be developed on a large scale and in commercial competition with the oilfields, not only of the West, but in the world without the confines of our United States.

We find ourselves, therefore, compelled to go abroad for an increasing proportion of our oil. We are importing an increasing amount of crude oil from Mexico; we are desirous of extending our internal consumption of oil for all purposes and we are endeavoring to build up a merchant marine that we are told can compete with the marine of other nations only by the use of fuel-oil. We are in danger, therefore, of finding that the margin of need over domestic supplies cannot be made good by our own nationals abroad, but only from our commercial and political rivals if these policies that are likely to prevent our nationals from entering into and exploiting foreign supplies, are maintained.

It has always been the policy of America to encourage foreign capital to enter freely, and for foreign companies to acquire holdings in the United States on a parity with our own nationals. I believe in this policy. I believe that in the long run this country will benefit more by such a policy than by endeavoring to restrict all the benefits to ourselves. I believe that the policy of national selfishness is short-sighted and may lead to serious international complications, and in the long run this country will benefit more by having reasonable exchange of opportunities between ourselves and other nations. I believe that the exclusion policy is short-sighted on the part of those nations that have initiated it, for, if persisted in, I am of the opinion that public sentiment will demand that the nationals of such countries be excluded from our mineral resources to the same extent that they exclude our citizens. I believe that if this tendency of erecting a Chinese Wall around each country is universally adopted, the United States will suffer probably less than any other country, for it has within itself resources that make it the most nearly self-sufficient. For many resources it has such an overwhelming superiority that other countries are more dependent upon us than we are upon them. However, the United States is in better position to bring this fact home clearly now than probably it ever will be again in the future. It would be unfortunate if, because of inaction on our part now, these intense nationalistic tendencies of other nations are allowed to crystallize into fixed policies that cannot be changed. It would be deplorable if the situation develops to such an extent that we are forced to retaliate

and exclude the nationals of other countries from acquiring mineral holdings in the United States; therefore I commend to the American Mining Congress a policy to be supported by it of urging a reciprocity that will place our citizens upon a parity with other nationals in the exploitation of the universal resources of the world.

* * * * *

In the utilization of fuel-oil, there is an unlimited field of investigation. Though petroleum is the cheapest of combustible liquids its peculiar properties should be utilized to the fullest extent, and it should not be used in direct competition with coal and other fuels that are more abundant. Petroleum products should not be burned for direct-heating purposes, as under a boiler, except under extraordinary circumstances.

The extensive use of fuel-oil for steam-raising should be discouraged, since the thermal efficiency obtained is only 10 to 15% in the average steam-plant, whereas in internal-combustion engines from 30 to 36% can be obtained. The internal-combustion type of engine for the heavy petroleum products, which constitute about 57% of the petroleum in the United States, should be developed so as to use this ideal fuel in a more efficient way. At the present time fuel-oil is the chief concern of the refiner and is sold at an actual loss in most cases, for a gallon of fuel-oil usually sells for less than a gallon of the crude oil from which it has been obtained. The questions of obtaining more gasoline for the increasing number of automobiles, trucks, and tractors, is also a great problem. It does not seem as if we could distill a much greater portion from crude oil, because we have already encroached upon the kerosene fractions to such an extent that it is likely that an economic equilibrium between the prices of the two products will soon be reached. More gasoline can be obtained by cracking fuel-oil, but it seems to me more desirable, if it can be done, to develop internal-combustion engines that will use the fuel-oil directly without cracking it. For a gallon of fuel-oil so used, we get about 30 to 35% thermal efficiency; whereas the same gallon of fuel-oil if manufactured into gasoline yields only 20 to 25% thermal efficiency and the cost of producing the gasoline is considerable.

The exploitation of oil-shale is also a problem of the first magnitude. It is probable that sooner or later we must fall back upon this source of supply, and we should take steps to find out, at the earliest opportunity, how the oil from the shale may be best obtained, whether it can be obtained profitably at the present time, and if not, under what conditions the exploitation of these deposits can be made profitable.

* * * * *

Perhaps the largest problem of all is the development of competent engineers and technologists to solve these problems. Along some lines capable engineers have been developed, but along others they are woefully lacking. This is particularly true in production. There is need for the trained engineer who is willing to go into the oil-fields and acquire first-hand experience of the practical side of the business. This is, I am confident, one of the

biggest openings for engineers and will be of the most benefit to the industry. The engineer who tries to work into the oil industry from the top is not the one who is going to meet the situation. On the other hand, there is need for an awakening upon the part of the oil industry as to the possibilities of practical application of scientific engineering ability. I do not say this as a criticism, for the practical oil-operator has accomplished wonders for himself, and if he has not taken engineering sufficiently into consideration, this is largely because there have not been engineers available who were competent to reduce his problems to an engineering basis.

* * * * *

The non-metallic minerals form a field for research and investigation, the importance of which is often not fully appreciated. The problems in this field are many and varied, though perhaps more elemental than in the metal-mining field, for but little technical work has been done here by mining men. But during, and since, the War, the great importance of the non-metallic minerals has begun to be realized, and it is probable that a new era of research is about to begin. To those not closely familiar with this group of minerals the great lack of even fundamental information can scarcely be realized. Little technical literature exists and comparatively few consulting engineers can be found who can bring both knowledge and experience to bear on technical problems in such minerals as clay, cement, gypsum, talc, mica, and fluorspar. The Bureau of Mines has long realized the importance of work in this field and has already published bulletins and technical papers dealing with feldspar, kaolin, fuller's earth, marble, sandstone, salt, and gypsum that cover the subjects in a preliminary way. Under the War Minerals Investigations, and its outgrowth, Minerals Investigations, specialists were assigned to many of the most important of the non-metallic substances and a foundation was laid for more detailed work.

* * * * *

During the War the supply of many of our raw materials in many cases were reduced to the minimum, many others were taxed to the utmost, and at times we faced a serious shortage. These limitations placed upon many of our resources were due to our military demands. Therefore, any consideration of a plan for national security must comprehend the nation's self-sufficient supply not only of our military necessities, but for an economical extension of our domestic resources wherever possible to meet the increasing needs of our army, navy, and the public. The welfare of a nation is dependent upon its resources, and the industrial development and general prosperity depend upon the adequate supply of the many materials that make for the life of the nation.

In mentioning these things, the point I wish to clearly emphasize is that the Bureau is fully cognizant of the necessity for extensive, careful, and systematic research and investigational work in order to meet the problems that are now confronting the mineral industry and that must continue to confront it if we are to develop our resources to the best advantage.

Individualism v. Nationalization

By P. B. McDONALD

The question whether great industries should be nationalized or retained open to individual initiative is being argued by some of the keenest minds in Europe and America. An official of the National City Bank in New York has drawn an interesting picture by suggesting, apropos of the death of Andrew Carnegie, that if that great manufacturer of steel had had to explain his plans and slips to Congressional committees and convince provincial politicians that steel-mills should not be apportioned around the country as improvements on rivers and harbors are, what a time he would have had! The same argument made plain that a great capitalist, such as Carnegie or Mr. Ford, consumes very little more after making his millions, than he consumed as a poor man, and that his large fortune mostly goes back into the business that he has created or else is directed to philanthropy; that is, he is an efficient agent for the public good, producing much and consuming little.

Another decided individualist is Harold Cox, editor of the 'Edinburgh Review'. His opinion on the nationalization of British railways is that such a policy would create an institution too vast for any man to manage, and that inevitably the human element, which now survives in spite of great trusts and corporations, would be eliminated. As to Sidney Webb's contention that nationalization would bring economies in the restriction of useless competition and the unnecessary duplication of services, Mr. Cox believes that the economies that could thus be effected would be counterbalanced by the inefficiency of management that follows the attempt to do things on too big a scale. Says Mr. Cox: "It is not very edifying, but it is the fact, that when the House of Commons considers the naval estimates the only members who are sure to be present are the representatives of constituencies in which there are dockyards. . . . Commercial men are frankly selfish, but on the whole their selfishness works out for the public advantage; state officials under a nationalization scheme are supposed to work only for the good of the nation, but in practice their own human natures are unequal to the strain."

In a series of letters in 'Everyman' the point was advanced that, while a cabinet minister may earn \$25,000 per year by valuable services to the State, a financier who receives \$250,000 per year from an investment in a factory does not earn that amount. A thoughtful answer to this stricture explained that the man who receives a very large return from an investment does so because efficient capitalists are exceedingly scarce. The State would probably be an inefficient capitalist; I was reading recently of a canal dug by the British government to connect two lakes in Ireland; when the water was allowed to flow in it sank through the porous rock that bottomed the expensive excavation, and the whole work was a failure.

There is no doubt that individualism develops shrewd, daring, forceful men, and that bureaucracy tends to the policy of 'dilly and dally' and 'delay, linger, and wait a little'. Yet Ruskin and Carlyle taught that excessive competition brought 'cheap and nasty' products, fear, and waste. In a recent number of the 'Anglo-French Review', A. Emil Davies, who is general manager for the British, Foreign & Colonial Corporation, advanced a surprising defence of nationalization. Mr. Davies said in brief that publicity might be made an effective safeguard against the vices of bureaucracy and that the faults of a democratic electoral system are merely the reflected faults of the community that is served. This latter point recalls Mr. Cox's remark about the indifference of electors to tedious parliamentary procedure unless a direct advantage is to accrue, as in the case of "the representatives of the constituencies in which there are dockyards".

Faults in bureaucracy, says Mr. Davies, are the faults of the governing class which dominates both government and business. "This class," he continues, "is on the whole, incompetent and not even educated . . . Large and successful businesses . . . stand a great deal more inefficiency and waste than people imagine . . . By the time the ordinary big business became bankrupt through the inefficiency of its principals, public criticism, in the case of a government or municipal department similarly mismanaged, would have become so great that the faults would have to be remedied." This is a remarkable accusation, and quite the opposite from conventional opinions on the subject. Mr. Davies is intimating that private businesses, even though successful, are often more wasteful than government management providing the latter is publicly and freely criticized. As an argument against this sweeping arraignment, beyond the general truth that nature and life itself are inefficient, the individualist who was quoted from 'Everyman' could be invoked again. That writer pointed out that an incompetent cabinet minister, or other important official in government, can, and does, involve the government in debt or blunders and then resign, not greatly damaged himself, while a capitalist who gets into a predicament has to pay the price.

As to the waste involved in excessive competition, Mr. Davies instances two English railroads carrying passengers to Portsmouth. Each put up a colored poster on station platforms advising travelers to the south coast to go by its route. Now, "the proportion of people who saw those posters and desired to go to Portsmouth would be very small—and what did it matter to anyone, except the respective shareholders, whether they went one way or another? Yet there were people designing these posters, printing them, making and keeping in repair the boards on which they were affixed; there were bill-

posters employed in pasting them up; all these people had to be kept and clothed, and yet, so far as the community is concerned, practically all their labor represented nothing but waste."

Against this perhaps hypercritical censure there could be arrayed all the tremendous arguments of the advertising men—the products and time-savers made possible by advertising campaigns, the raising of the level of civilization by the suggestions conveyed in advertisements, the enormous diffusion of modernity to the farthest corners of the earth, etc. Referring to the post office, Mr. Davies hints that under purely commercial operation, as opposed to government management, a charge of a shilling might be made on a letter to Australia, while from one London suburb to another a halfpenny might suffice. Such is the "resiliency and spirit of accommodation" claimed for individual enterprise, compared with the flat rates and standardization of nationalization.

From these typical arguments for and against government ownership it can be seen how important is the bias and personality of the man who is talking. Out of the conflicting criticisms stands the undoubted fact that the policy of government ownership is gaining ground. To what extent the movement is due only to a vague dissatisfaction with present conditions rather than to a real belief in the soundness of the principles of nationalization, and whether or not a reaction will swing the pendulum back to individualism, are questions that can be answered only in opinions. Stephen Leacock, professor of political economy at McGill University, declares that the competitive industrial system needs much more intelligent directing, but that Socialism, which of course includes nationalization, is "a beautiful dream".

Radium Minerals

Radium minerals are generally found in connection with granitic masses—that is, in places where granite forms at least part of the rock of the country. Most of the original radium minerals, such as uranite, samarskite, and brannerite, are black and have a shiny fracture and a high specific gravity. These minerals are rarely found in commercially valuable quantities. Pitchblende, which has the same composition as uranite and the same general appearance except that it shows no crystal form, occurs in veins. It has been found in only a few places—in Bohemia, southern Saxony, Cornwall, and Gilpin county, Colorado. When these original minerals break down through weathering, other radium minerals are formed from them, such as autunite, torbernite, carnotite, and tyuyamunite.

Carnotite and tyuyamunite are the most abundant of these minerals and now furnish the bulk of the world's radium. They cannot be told apart by the eye, for both are of bright canary-yellow color and are powdery, finely crystalline, or, rarely, claylike in texture. Carnotite is a hydrous potassium-uranium vanadate. Tyuyamunite is similar in composition but contains lime instead of potash. The greatest known deposits of these two minerals are in south-western Colorado and south-eastern Utah,

where both are associated with fossil wood and other vegetation in friable, porous, fine-grained sandstone. Small quantities of carnotite have been produced near Olary, South Australia. The only other deposits that yield tyuyamunite in notable quantity are those of Tyua-Muyun, in the Andiyan district, Ferghana Government, central Asiatic Russia (Russian Turkestan), where tyuyamunite occurs with rich copper ores in a pipe in limestone.

A drop of strong hydrochloric acid on either carnotite or tyuyamunite gives it at once a rich reddish-brown color, and the addition of a drop of water immediately changes the color to yellowish green. The reddish-brown color shows the presence of vanadium, and the yellowish-green color the presence of uranium, for if vanadium alone were present the color would be clear green or bluish green. Iron, however, may interfere with the test, producing a color that covers or masks the others. Surer tests may be made either with an electroscope or with a photographic plate. If a piece of radium-bearing ore is placed on a plate-holder containing a sensitized plate with only the cover of the plate holder between the specimen and the sensitive film of the plate, the plate will be 'light struck' in from 24 hours to 4 or 5 days, the length of time consumed depending on the richness of the specimen. Specimens should never be placed on the plate itself, because the pressure of the specimen will give an effect that simulates light striking. This test may be made with other uranium minerals to which the acid test given would not be applicable.

Radium is a metal and is described as having a white metallic lustre. It has been isolated only once or twice, and few persons have seen it. It is ordinarily obtained from its ores in the form of hydrous sulphate, chloride, or bromide, and it is in the form of these salts that it is usually sold and used. These are all white or nearly white substances, whose appearance is no more remarkable than that of common salt or baking powder. Radium, radium salts, and radium minerals are not generally luminescent. Tubes containing radium salts glow because they include impurities which the radiations from the radium cause to give light.

Radium is found in nature in quantities so exceedingly small that it is never visible even when the material is examined with a microscope. Radium ore ordinarily carries only a small fraction of a grain of radium to the ton, and radium will never be found in large masses, because it is formed by the decay of uranium, a process that is wonderfully slow; and radium itself decays and changes to other elements so rapidly that it does not accumulate naturally in visible masses.

QUARTZ LODS in the Willow Creek district, Alaska, where mining has been done since 1908, have yielded more than \$1,600,000 in gold and silver and are still being worked profitably. The character of the deposits and the work done in the district in 1917 are described in a report by S. R. Capps, in Bulletin 692-D of the U. S. Geological Survey.

The Goldfield School of Mines

By M. A. FARRELL

Nevada has four secondary mining schools, one each at Goldfield, Tonopah, Ely, and Virginia City. Until September 1 of this year they were under the direction of the University of Nevada and were operated as affiliated organizations, supported by the State and Federal government and supervised by Francis Church Lincoln, dean of the Mackay School of Mines of the University of Nevada. Prof. Lincoln was the founder of the schools. They are

thing is provided for complete courses in all subjects taught and the work is arranged so as to hold the interest of the pupil and demonstrate to him the practical side throughout the course. An excellent collection of minerals is used in connection with text-book instruction in the physical properties, structure, and composition of minerals, and the well-equipped laboratory provides for determinative analyses of ores. The courses provide for

Photo by Tune, Goldfield

LABORATORY OF THE GOLDFIELD SCHOOL OF MINES

now operated under direction of the county Boards of Education in co-operation with the State Board of Vocational Education and are under supervision of R. A. Jones, State Director of vocational work. Prof. Lincoln is still connected with the schools in an advisory capacity. After December 31, 1920, they will be maintained as County, State, and Federal enterprises, with the County and State each providing one-fourth of the cost of salaries and the Federal government one-half under the terms of the Smith-Hughes Vocational Education Act. The cost of supplies will be borne by the counties. The act changing the control provided for a fifth institution in White Pine county, which it is planned to have at McGill, where the smelters for the Ely district are situated.

The Goldfield institution is in a two-room stone building formerly used as a primary school, and it has the best quarters and equipment of the four in the State. Every-

a minimum of instruction from text-books, resulting in the interest of the pupil being held if he has ordinary ambition. Men can be fitted for every position in mining and milling up to assistants to cyanide and flotation metallurgists. They may become assayers, mill solution men, cyanide or flotation plant foremen, geologists' assistants, or ordinary operators of machine-drills.

The schools are in session 30 hours weekly and that in Goldfield is open five hours daily except Sunday, two hours in the morning and three in the evening. Courses are offered in mineralogy, explosives, mining business, volumetric and fire assaying, surveying, mechanical drawing, dynamic geology, cyanidation, flotation, and chemistry. There is no charge for instruction and practically all text-books are furnished free. The entire process of oil-flotation is illustrated in Goldfield with a model of the Callow pneumatic flotation-machine. The

machine takes a charge of 200 grams of pulp, which an air-lift returns to the top of the machine, providing continuous operation when desirable. With the present equipment a cyanide plant could readily be constructed. Publications devoted to mining and reference books on technical subjects are provided for use by anyone interested. The principal and only instructor is G. E. Hoffman.

The school has been attended by miners, millmen, machinists, prospectors, surveyors, hoist-engineers, mine-blacksmiths, samplers, 'divining-rod experts,' a Methodist minister, railroad-men, lawyers, doctors, grocery-clerks, a dry-goods clerk and his wife, bookkeepers, grocery store owners, truck-drivers, real-estate men, a telegraph operator, a newspaper editor, a saloon-keeper, who attended regularly day and night for many months after the State went dry, and high-school pupils. This list of occupations shows a startling variety and indicates the difficulties in the path of the instructor. Their knowledge of everything from minerals to the English language differs greatly, as their previous education ranges from practically none to a complete university course. One pupil studying mineralogy quit because the names of the minerals were too difficult to pronounce, and a prospective geologist, taking the course largely for the practice in reading he thought it would provide, found there was a difference between a book on geology and a first reader. A Swedish-English dictionary was the constant companion of another pupil in his efforts to understand the instructor, in which he eventually failed. It was finally discovered that a man who had difficulty in titrating did not know the multiplication tables and he was given up as a hopeless case. A member of the geology class, wise beyond the time he had studied the subject, in wandering over the erupted Goldfield malapai, decided to his own satisfaction that the sun-blackened rocks scattered over the top were glacial deposits and thereafter was given to long and learned discussions on the subject of such deposits. A 'mine owner' found on examining the collection of minerals that he had them all on his claim, according to himself.

The allotment for the Goldfield school to cover expenses from July 1, 1919, to June 20, 1920, was \$3144, of which the State provided \$2700 and the Federal government \$444. Of this sum \$2400 was for the salary of the instructor and \$744 was for supplies. The school at Goldfield, the last started in the State, was opened in June 1917. To date 115 pupils have registered, of whom only six have finished courses, due to the transient nature of the population of the town in the past. One pupil has been attending practically continuously since December 1917, another since May 1918, another since September 1918, and a fourth since October 1918. The school re-opened this year after the summer vacation on September 1 and in that month 21 pupils registered, 14 of whom are attending with fair regularity. There were no additional registrations to October 15.

These four schools are the only institutions of their kind

in the State where men without high-school education are accepted. Each pupil receives an education worth several hundred dollars to himself and something to the mining industry. To the prospector the schools have been a benefit in teaching him that the so-called rare minerals are in many instances rare merely because he does not recognize them while on his trips, or mines for other minerals ore containing them. There are numerous instances of discoveries being made by prospectors with aid of the schools. The Goldfield school has been of far greater benefit to the community than the six men who have finished courses would indicate and, with the employment of from 300 to 500 men by the Development company, as planned, and the chances good for the Florence to increase the force of miners now employed, it is certain that the mining interests will make a firm stand to have the institution retained after December 31, 1920, through forcing an appropriation for support into the county budget despite the rumored opposition of some public officials on the ground of expense.

Diamond Mining by Diving Bell

An interesting scheme is about to be tried on the Vaal river, South Africa. A company called Deep Water Diamonds has been formed to carry out a project for recovering diamonds from the bed of the river by means of an air-lock caisson or diving bell. According to a description published by the 'South African Mining and Engineering Journal' of Johannesburg, the bell of the caisson has a diameter of 15 ft., giving ample space for several natives to work. The bell is specially designed for working in the deep pools and can easily be shifted from one pool to another, the whole structure being attached to pontoons that enable it to float in shallow water, from a foot to 18 inches deep. The bell is lowered into the water by means of water ballast, and the water is displaced by air pumped into the bell by compressed-air pumps. The interior is lighted by electricity, and has a telephone and signals installed and arranged for communication. The gravel is hauled up by a compressed-air hoist and is handled by purely mechanical means once it enters the skip. The apparatus is designed to work in any depth of water up to 65 ft., while the deepest pool in the Vaal in the dry season is only about 30 or 40 ft. On the deck there are boilers and a steam turbine for running the machinery, and an air-compressor for supplying the bell. There is a bin to accommodate the gravel brought up, a trommel for cleaning and classifying the soil, gravitators for separating the diamonds, and a sorting table. Previous attempts at obtaining diamonds from the bed of the Vaal river have been made by means of break-waters and suction or bucket dredges, but the latter method is stated to have proved unsuccessful because the bed of the river is a natural concrete of boulders and clay. 'Advices since received indicate that the idea of recovering diamonds from the Vaal river by means of a caisson is not new.

REVIEW OF MINING

FROM OUR OWN CORRESPONDENTS IN THE FIELD

ARIZONA

COPPER PRODUCERS CURTAILING PRODUCTION.

DOUGLAS.—A spirit of pessimism was injected into the copper situation in this district by the dual announcement of the Phelps Dodge and Calumet & Arizona managements that production was to be materially cut, as a safeguard to maintain operations during the period of stagnation in the copper industry. At the Copper Queen smelter one of the four blast-furnaces that has been in operation for the last few months was shut-down. It was announced that the monthly output would be reduced from approximately 9,000,000 to about 7,500,000 lb., or about the same rate of production as last spring. This change in operation caused the discharge of approximately 35 employees. The Calumet & Arizona also will return to the level of last spring, closing one of the two big blast-furnaces and materially reducing the present output. Just what this will amount to, Harry A. Clark, superintendent, said he would be unable to say until after the first of December, by which time all plans would be worked out. In an interview here, Gordon R. Campbell, secretary of the C. & A. company, displayed distinct pessimism with regard to the immediate future of copper. Mr. Campbell, with Capt. Thomas Hoatson, vice-president of the C. & A. company, now is making the rounds of the Arizona holdings of the corporation. Although the C. & A. has determined to return to about the same level of production as last spring, according to Mr. Campbell, it has not been decided to reduce tonnage materially from the company mines in the Warren district, it being entirely possible that the same tonnage, but of lower grade ore, will be treated. The policy probably will not mean material reduction in force. The C. & A. will continue its development operations on its properties in the Warren district, doing pioneer work to open territory neglected of necessity during the War. Work at the Junction shaft, where development operations of the company centre at present, will be continued. Some good ore has been opened up recently in the direction of Cochise. The Phelps Dodge Corporation has issued a circular announcing the appointment of P. G. Beckett, now assistant to the president, as general manager with headquarters in Douglas. A. T. Thomson, assistant to the president, will return to the New York office. T. H. O'Brien, now manager of the Stag Canyon branch, is appointed manager of industrial and public relations and consulting engineer of the Stag Canyon branch, with headquarters in Douglas. W. D. Brennan, formerly

general manager for the Union Pacific Coal Company, is appointed manager, Stag Canyon branch, Dawson, New Mexico. All changes are effective January 1.

MIAMI.—An inspection visit to the properties of the Inspiration Copper Company and International smelter was made by C. F. Kelley, president of the Anaconda Copper Co.; L. D. Ricketts, vice-president of Inspiration Consolidated and International Smelting companies; William Wraith, manager for the International Smelting Co.; and T. F. Conrad, secretary to Mr. Kelley. Production at the Inspiration Consolidated remains at about the same rate, that is, about two-thirds capacity. The concentrator is operating from 14 to 15 sections, depending upon slight fluctuations in the ore supply from the mine. The Miami concentrator is operating from 4 to 5 sections or approximately 4500 to 5000 tons daily. The construction of the new hoist-house at No. 5 shaft is nearing completion, the frame work and covering of the building being finished. Erection of the new steel head-frame is proceeding rapidly, the back panel being more than half completed. The new man-hoist is nearly in place and should be in operation in a month or five weeks.

Gibson Consolidated has settled down to a steady working basis of milling dump ores and getting the mine in shape for production from underground. The concentrator is operating three shifts regularly, handling 130 to 160 tons of ore daily, producing about 11 tons of concentrate. Most of this ore comes from the dumps. An incline-tramway, operated by a steam-hoist, is in operation in recovering ore from the dump. The ore is loaded into mine cars by use of Indians and then hoisted to the crushing plant by the tram. Repair work in the shaft below the 200-ft. level is proceeding satisfactorily and the shaft will be in position for operation by the time the bad weather interferes with recovery of ore from the dumps. Shaft No. 1 of the Van Dyke Copper Co. now is 510 ft. deep. Sinking has been facilitated by the installation of the steam-hoist and progress at this depth is practically the same as was maintained in the upper part of the shaft.

CALIFORNIA

GRASS VALLEY, NEVADA COUNTY, PLACER COUNTY

GRASS VALLEY.—The Gold Lead Placer Mines, organized to work claims near Grass Valley, has filed articles of incorporation with the county clerk. The capital stock is 400,000 shares of the par value of \$1 each. C. F. Lobecker, John T. Leatham, Oscar L. Coffin, John G.

Curts, and Olga Dausse are named as directors and incorporators.

Driving 800 ft. east from one of the lower levels in the Allison Ranch mine into the Berryman ground, where there is a good surface outcrop, has not yet encountered any ore. All work in a west drift for prospecting purposes has been suspended. Formerly one of the famous producers in this district, operations in search of new ore-bodies for the past few years have resulted in nothing but expense, over \$700,000 having been spent for that purpose alone. The mine still has several millions to its credit, but each new company has ceased operations only after spending a large sum in an effort to locate a new body of ore. The present company has been very persistent, driving on each side of the shaft for long distances. A fine showing has recently been made in one of the veins on the Morande property west of Grass Valley. It is well defined and estimated to run \$100 per ton. The owner, the State Highway Co., is reported to be continuing development with the purpose of encouraging some larger financial concern to take over its interests.

NEVADA CITY.—At the Round Mountain Champion mine, bonded recently by a company headed by A. D. Foote, the old McCloud tunnel is being cleaned out. It is in 700 ft. and driving to tap the gravel channel has commenced. A new compressor was recently erected. Leonard Rockefeller and W. Buffington have a splendid showing on their quartz claim east of Nevada City. A 5-stamp mill is being erected and 300 tons of ore of an estimated value of \$20 per ton is ready for crushing. The old Kate Hardy quartz mine on Oregon creek below Forest is being explored thoroughly. Twenty-five tons of supplies is on the ground for continuous operations throughout the winter. The main tunnel will be driven ahead, while the shaft within this tunnel will be sunk 400 ft. The mine is equipped with a small mill and is operated electrically. The mine has been a producer, and is believed to be on a continuation of the Tightner vein at Alleghany. The owner, W. M. Beggs, of San Jose, has bonded the property to some Boston people and E. C. Montgomery has been placed in charge.

NEVADA COUNTY.—Good progress is being made in sinking the shaft in the Mariposa tunnel 600 ft. from the portal of the tunnel. The Apex and Bug quartz claims at Meadow Lake have been sold by the sheriff to E. Z. Cuneo, a judgment creditor against Harry D. Ramsay for \$2007. The old Excelsior mine at Meadow Lake is being unwatered by Peter Bokay, who has equipped the property. It has not been operated since 1905 and developments on a large scale have been planned.

PLACER COUNTY.—At the Canada Hill quartz mine every preparation has been made for winter work; all the buildings and yards have been protected by snow sheds. During the summer a test-run of 100 tons yielded \$1500. The tunnel is to be driven ahead ensuring a greater working depth. No ore will be extracted until spring. The Rising Sun mine near Colfax is being unwatered by an electric hoist and nump, the latter having a capacity of 400 gallons per minute. Complete drainage will take

from six weeks to two months. Messrs. Jeffrey and Day have a permit to carry on hydraulic mining at the old Lost Camp mine two miles from Blue Canyon and are making preparations for a trial run.

The Placer Chrome Co. has about completed its new mill near Rattlesnake bridge. At the present time the ore is being concentrated in an old mill running on one shift. Several carloads of concentrate were recently shipped East. Operations will be extended as the company intends to produce a high-grade concentrate. The Bear Barytes Co. has shipped several hundred-ton lots the past few months from Alta, although the mine is above Dutch Flat but a few miles. A small force of miners and a few teamsters have been employed. Bad roads have been a serious drawback.

SIERRA COUNTY.—A new Gibson mill has just been completed at the Martini mine. It has an estimated capacity of 18 tons per day and is operated by a 5-hp. gas-engine. A recent test run yielded \$10 per ton. The mine is at the head of Keystone ravine south of Sierra City and is owned by P. B. Loeffler and J. E. and Marion Westfall.

COLORADO

ACTIVITY AT LEADVILLE.—APEX LITIGATION AT RICO.

LEADVILLE.—The high price of silver is bringing about greater activity than has been experienced in many years, and mining men generally concede that by next summer few shafts in the district will be idle. Properties are in demand and many have been taken over under lease and option, or, if a bond cannot be secured, under straight lease. The Long and Derry, a former rich silver-gold producer, has been inactive for some time. At present, operations are confined to cross-cutting to one of the mineralized porphyry dikes where ore is looked for on the contact. Henry Schrader is operating the Griffin by tunnel and is shipping ore weekly that averages 50 oz. of silver per ton. The lower tunnel is sub-leased and is being extended into the mill. It is now in about 1000 feet.

RICO.—The apex litigation of the Rico Consolidated Mining Co. and the Rico Argentine Mining Co. has been postponed until June 1920, and as the higher-grade ore-bodies in which both properties are interested is within the contested area, and tied up under an injunction, there will be very little production by the leading operators of the district until the case is settled. As the Marmatite M. & M. Co. is leasing the Rico Argentine property, the operations of this company are necessarily curtailed, although extensive operations on the Pro Patria and other properties in the district are under consideration. Howard M. Fields, president of the Marmatite M. & M. Co., is forming a company, to be known as the Marmatite Mining Co., which will operate the Emma mines, situated at Dunton, under a lease. The Emma formerly shipped gold-silver ore, and although it has been idle for a number of years, it has always been looked on as a good mine.

PARADOX VALLEY.—Bulkeley Wells of the Smuggler

Union Mining Co. has assumed full control of the Radium company of Colorado. The company has a number of claims in the Long Park region, and is operating a series of mines, producing carnotite ore in large quantity. Two more mines were opened recently. Under the new regime the properties of the company will be developed to the utmost.

LA SAL MOUNTAINS.—The Michigan-Colorado Copper Co., operating on the Cashin group, has now definitely decided to erect a 100-ton mill at the mines. Power will

in the lime formation. Some assays show 70 oz. of silver per ton, and it is believed that the grade will increase as the work progresses. Mr. Little has transferred his interest in the lease on the Little La Plata to W. A. Becker, who plans to develop the mine into a producer for the coming season. A compressor has been erected and two cross-cut tunnels will be driven with the object of cutting the vein. The property is owned by the Wahl Brothers estate, and has been under lease to Messrs. Little and Carrigan, who worked over the dump during the past

A VIEW OF TELLURIDE, COLORADO

be supplied by 100-hp. oil-burning engines, as the distance from the railroads and haulage difficulties favor oil as a fuel. The water resources of the district are being studied, and it is probable that water power will eventually supplant the oil-burning engines.

OURAY.—The Camp Bird Mines & Tunnel Co. is driving a series of raises from the new tunnel to the upper workings in order to permit development, and also to improve ventilation. Steel & MacDonald have abandoned their operations on the Calliope dumps for the season. The White Cloud Mining Co. is reported as having struck a rich vein of ore on the Money Queen.

LA PLATA.—Deep snow covers the ground at the higher elevations of this region, but development will continue on many of the properties of the district throughout the winter months. The Jumbo Mining Co. has made a few trial shipments of ore from the virgin ground opened up

season, shipping ore that contained 12 to 15 oz. of silver, in addition to some gold.

MICHIGAN

DEVELOPMENT AT THE SHAFT OF THE OLD MESNARD PROPERTY.

The Mohawk mine today has a larger force of underground workers than at any time within the past year. Calumet & Hecla added 56 miners to its working force in the past ten days.

No. 8 shaft, locally known as the old Mesnard property of the Quincy company, now is being sunk for the 71st level. This shaft today has close to five miles of underground openings in which work is being done. It is interesting to note too, that at the very bottom of the shaft the openings are in a quality of copper-bearing rock which is

really better than the average for this branch of the Quincy company and above the average for the year 1918. The active lateral workings extend from the 54th on 16 different levels all the way down. The record of rock hoisted from this shaft for the past year will reach 350,000 tons if the present rate is maintained. This, of course, includes a substantial amount of mass and barrel copper in addition to the regular rock. Practically all of the stoping work has been confined to the east branch of the Pewabic formation. The only place where the Mesnard shaft has run out of high-grade ore is 2000 ft. north of the shaft. At that point, on several of the levels, the lode has pinched into poor ore. This condition is rather strange, for the upper levels showed rich formation to the north. In fact, the showing in the extensions toward the Mesnard territory in several of the upper levels of No. 8 shaft was so good that the Quincy company purchased this property on the showing, started the shaft and laid the foundation for a permanent hoisting-plant. Parts of the hoisting-plant were delivered five years ago and have not yet been set in place, no work being done at this No. 9 shaft, known locally as the Pontiac, in five years.

The return of old Michigan copper miners from Italy to Calumet offers an interesting commentary on the labor situation. When the War ended large numbers of the foreign miners returned to their native lands, the number returning from Calumet to Italy and Croatia being noticeably large. Apparently they did not find conditions there as much to their liking as they had expected, as the few who have returned to Michigan tell of the desire of those remaining in Italy to return to the United States.

NEVADA

OLYMPIC MILL BURNED.—EUREKA CROESUS CONTINUES SHIPMENTS.

MINE.—The 100-ton cyanide mill of the Olympic Mines Co. at Stewart Springs, in the gold-bearing porphyry belt north of the Simon mine, has been totally destroyed by fire. The mill was built in 1916 and at that time was valued at \$70,000. It was constructed of wood and sheet-steel. The company was formed by Fred Siebert, a Reno, Nevada, mining engineer, and a number of San Francisco men are interested with him. The burned plant had been a steady producer of bullion.

LIDA.—The MacNamara mine, at Indian Gardens, 8 miles west of Lida, is being re-opened by the Allied Mining & Milling Co., in which Montana and Utah men are interested. The mine was discovered in 1880 and until 1903 it was worked by the locator. From that date it was tied up through an option and litigation until 1916, when it was taken over by Trepp and Heinecke of Lewistown, Montana, who, after prospecting the old workings, formed the Allied company early in 1919. Stopes show that a good production of lead-silver ore was made in the early days, and since 1916 three carloads of ore of a gross value of \$5000 have been shipped. The mine is opened through three tunnels and a shaft, which show the vein to

be from 6 to 15 ft. wide. The greatest vertical depth reached, 170 ft., is in a 330-ft. cross-cut tunnel, and a sample taken from a 10-ft. face in a drift at this depth gave an average of 35% lead, 15 oz. silver, and a trace of gold. The vein is in a well-defined alaskite-lime contact that can be traced on the surface for nearly 3000 ft. The company plans to prospect the vein through the shaft at a depth of 225 ft. to open the extension of the ore found in the tunnels, and if this work is successful, a 100-ton concentrator will be erected, as the distance of 33 miles to Goldfield, the nearest railroad point, makes shipping too expensive. Springs on the claims are estimated to have a flow of 90,000 gallons and there is a plentiful supply of nut-pine for timber.

CACTUS.—Joseph F. Nenzel, promoter of the Cactus Nevada Silver Mines Co., and Joseph Fynney, of the Boston real estate firm of Fynney & Cutter, which financed the company for \$280,000, recently visited the mine. The main shaft, which is vertical and sunk 10 ft. from the vein, is now 200 ft. deep and it is planned to continue sinking to 600 ft., cross-cuts to be extended to the vein at 100-ft. intervals for further exploration. The principal work has been done at 100 ft., where drifts have opened ore for a distance of 300 feet.

DIVIDE.—The Detroit Divide has taken over the Carbonate mine in the New York Mt. district of San Bernardino county, California, 5 miles from the Nevada line and 2½ miles from the Salt Lake railroad. The Carbonate has been developed for three years, during which \$30,000 has been spent in exploration work and in the construction of a 20-ton concentrator. A 3-drill air-compressor recently was put in place. The ore is a sulphide containing silver, copper, and lead, two-thirds of the metallic content being in silver. The lead content is small. The average width of the vein, where opened at a depth of 750 ft. by a tunnel, is 30 ft., the maximum width of the shipping ore being 4½ ft. Two ore-shoots have been opened through the tunnel, one 50 and the other 95 ft. long. The formation in the district is grano-diorite, which is cut by dikes of porphyry. It is planned to extend the tunnel, shipping the best grade of ore, and erect a small flotation plant to treat the low-grade. The claims of the company in the Divide district are in the north-western part, adjoining the New York group.

EUREKA.—The Eureka Croesus continues shipments of rich ore at a rate of from 8 to 10 carloads weekly. New machinery, consisting of two 75-hp. semi-Diesel engines and an 8-drill air-compressor, has been bought by the Holly, on Adams hill, 1½ miles north of the Ruby hill mines. The winze from the 400-ft. level is nearing the 600-ft. point, where connection will be made with the shaft after the latter has been sunk from the present depth of 400 ft. Sinking the shaft to 700 ft. will be started after the new machinery has been erected. Shipments are being made from the winze. The Eureka Climax, adjoining the Diamond in the Prospect mountain part of the district, south of the town, is preparing to start work. This company, which was formed recently with officials of the Croesus heavily interested, owns the

Deadbroke, New Year, and Dugout mines, the latter having a production record of \$100,000 to a depth of 100 ft. The principal development is through tunnels.

GOLDFIELD.—At 445 ft. from the shaft the west cross-cut from the shaft on the seventh level of the Florence is a short distance into the leased Combination No. 2 claim of the Development company. The vein it was expected to enter near this point has not yet been cut. The south-east cross-cut on this level is 307 ft. long. The driving of these cross-cuts, designed to explore far outside proved territory, is the only work being done by the Florence company.

OREGON

OPERATORS PREPARING TO RESUME GOLD MINING.

GRANTS PASS.—During the War period gold mining declined in Josephine county and the operators took up

ground and by driving propose to be washing gravel by the first of the year. In this same region the old Hansen property is being prospected by Michigan people, by sinking shafts to bedrock with a view to eventually using a dredge. The ground averages 35 ft. to bedrock and if equipped with a dredge a hyro-electric power-plant will be erected near by on the Althouse.

PICKETT CREEK.—The Big Four placer mine, 10 miles west-northwest of Grants Pass on Pickett creek, near the junction of Rogue river, which has been idle for several years, is ready to resume operations. This property is owned by M. J. Merrill, of Portland, Oregon, and covers 200 acres, chiefly on a bedrock of slate. The gravel ranges from 30 to 70 ft. in thickness, and is in part clearly stratified. The 14 ft. of red earthy sand and clay overburden is said to contain fine gold that can be saved, but the large pieces are in the bottom of the gravel. The

Photo by Tune, Goldfield

A VIEW OF THE FLORENCE MINE, GOLDFIELD, NEVADA

the mining of the War metals, and since the War the high cost of mining has prevented a general resumption of gold mining. Now, however, the operators are reaching a point where many of them, heavily encumbered with equipment, have no choice but to resume gold mining with present costs. Nearly all the old hydraulic placer mines in the county are ready for the season's run, and many operators are preparing to resume quartz mining. The early September rains were an impetus to the placer miners to prepare their properties in anticipation of an earlier season than usual, and the production of gold from this source the coming season promises to be the largest in the history of Josephine county.

HOLLAND.—W. R. Burner and associates of Holland, in the western part of Josephine county, have purchased the McCourt placer ground in that district and are employing a large force of men in developing the property. This ground for a number of years has been known to be rich, but on account of the depth and water the old-time equipment was useless. The new owners, however, are placing modern engines, pumps, hoists, etc., on this

lower 12 ft. of gravel contains well-rounded cobblestones, the largest being 6 inches in diameter. At the bottom a few boulders, generally slate, rest on bedrock, and from 2 to 4 ft. of the bottom gravel is partly cemented. The rim-rock rises abruptly and the slates are much crushed and faulted, forming a terrace on the north-west toward the creek. The old channel is 250 ft. in width and 30 ft. in depth below the slate-rim terrace, from which the gravel capping has in part been mined away. The water is supplied from Pickett creek at a head of 200 ft., two giants being operated for a large portion of the year.

UTAH

GENERAL NEWS OF THE STATE.

SALT LAKE CITY.—The geophone sent by the U. S. Bureau of Mines for use by the crew of mine rescue car No. 11, in cases of underground accidents, where it is necessary to locate men or sounds at some distance underground, was called into service in the effort to rescue men entrapped in the Hunter Mining & Smelting Co.'s

mine at Mullan, Idaho. The men were rescued safely and the car has returned to Salt Lake City. This mine-rescue car, in charge of Richard V. Ageton, is one of the 11 cars now in use by the Bureau of Mines for training miners in first aid and rescue methods, and the use of oxygen-breathing apparatus. Each car has a crew that includes two experienced miners, a mining engineer in charge, and a surgeon.

ALTA.—By order of the Public Utilities Commission of Utah, issued November 15, the Little Cottonwood Transportation Co. is ordered to resume service on its line from Alta to Wasatch, in response to application of the South Hecla Mining Co., which declared it had ore awaiting transportation. The Commission held that the railroad company, as a common carrier, should give notice before discontinuing service, to the Commission, to the public, and to shippers. In the absence of such notice, the operation of the road should be resumed as soon as possible, the Commission orders, until such time as the Commission finds that weather conditions are prohibitive to further operation. The decision further stated: "The above would seem to be a reasonable and fair requirement in the treatment of the public. In this case, it is claimed by the defendants that the condition was precipitated by a sudden storm in the mountains which, of course, tended to relieve the railroad company from further operations while such conditions prevailed, if they were the cause of suspension of service. The shippers had reason to believe that service would continue until such time as notice would be given of discontinuance of operation." Had operations of the railroad been discontinued, it would have seriously affected the output of mines in this district.

Directors of the Cottonwood Metal Mining Co. have elected W. Mont Ferry, Mayor of Salt Lake City, as president; E. E. Watrous, vice-president; and S. J. Truman, secretary-treasurer. The main tunnel, now in 1071 ft., has encountered three fissures. It is expected that the Silver King fissure, in which good ore is generally found, will be cut within 400 or 500 feet.

BINGHAM.—Development work is continuing in the Montana-Bingham mine, according to C. G. Ballantyne, general manager. Shipments have been steadily maintained. About a month ago, in the Mayflower drift on the Montana-Bingham level, in the vein from which several shipments of high-grade copper ore have been made, a shoot of high-grade silver-lead ore was struck. After passing through this shoot and through a zone of iron sulphides, another larger and richer shoot was cut in the vein. For a distance of 15 ft., the top, bottom, and sides of the drift have been in ore, averaging from 8 to 16 oz. silver and from 20 to 27% lead. Former discoveries in this vein have been in the quartzite, while the last have been made in the limestone.

OPHIR.—The old Montana mine, to the north of the Ophir Hill property, will begin operations December 1. About 20 men will be employed there. The Diamond-Drilling Co. has completed the first of a series of holes on the old Walker property, which embraces the south

side of the canyon and the underground rights of the town. The purpose of the drilling is to prove a theory advanced by several geologists that the same formation exists on the south side of the canyon as that encountered by the Ophir Hill. It is reported that the objective has been reached, and if this is the case, considerable activity can be expected from this company.

Lessees in Dry canyon are showing more activity than for some time past. It is expected that shipments during the current month will be considerably heavier than for any previous month this year. Shipments from the Ophir Hill property, the largest in this district, aggregate about 300 tons of high-grade silver-lead ore per week. The company is now sampling the old tailing-dump to ascertain the advisability of having it re-treated.

TOOELE.—It is reported that Jesse Knight, the well-known mining man of Provo, has become interested in the development of several groups of mining claims in Middle and Settlement canyons, and that active operations are now progressing. It is said that the Knight Investment Co. has taken an option on the Black Diamond group of claims in Middle Canyon from J. A. Kaufman, and on the Bingham-Midway group in Settlement canyon from O. E. Parsons and associates. There are now two shifts of four men each working on the Black Diamond group, driving a tunnel to connect with the Bingham-Midway group, from which Mr. Parsons has made several shipments of ore. Mr. Knight has had his engineers make an examination of the property, and they are of the opinion that the Bingham orebodies continue through the mountain and can be found on the Tooele side of the range, and it is thought that with extensive development work, large orebodies will be encountered.

PARK CITY.—Shipments from this district for the week ending November 22 totalled 1788 tons, of which the Silver King Coalition contributed 422 tons; the Ontario Silver, 346 tons; the Judge M. & S., 356 tons; the Daly-West, 287 tons; the old Daly, 161 tons; the Naildriver, 55 tons; and Three Kings, 25 tons.

EUREKA.—Ore shipments from the Tintic district for the week ending November 22 totalled 160 cars, being an increase of 20 over the previous week. The most noticeable increase was from the Tintic Standard property—from 18 cars for the week ending November 15 to 28 cars for the week ending November 22. With the increase in the price of silver to \$1.34—a rise of 7c. in two days—mine operators of the district are optimistic in regard to the future of Tintic properties. At the same time, recent developments in the east side of the district indicate a bright future for the entire camp. Mines and number of carloads shipped during the week were as follows: Chief Consolidated, 41 cars; Tintic Standard, 28; Dragon Consolidated, 14; Iron Blossom, 13; Centennial Eureka, 12; Eagle and Blue Bell, 10; Colorado, 9; Mammoth, 9; Grand Central, 7; Swansea, 3; Gemini, 3; Ridge and Valley, 3; Bullion Beck, 2; Empire, 2; Victoria, 1; Alaska, 1; Oasis, 1; Sunbeam, 1; total, 160 cars.

WASHINGTON

INCORPORATION OF THE LA FLEUR MOUNTAIN COPPER CO.

FERRY COUNTY.—The La Fleur Mountain Copper Co. has been incorporated under the laws of the State of Washington, with Colville, Stevens county, the principal place of business. The directors are W. A. Acorn, president; I. J. Lasswell, secretary; E. J. Millberg, treasurer; George Wisner and J. L. Lasswell. The company owns the Comstock and Walla Walla groups, composed of the Copper Queen, Allis, Comstock, Copper Butte, Walla Walla, Le Roi, and four other fractional claims, all situated north-easterly and south-westerly on La Fleur mountain. They are traversed by two separate veins, known as the Walla Walla and Comstock veins. The Walla Walla vein cuts diagonally across the Walla Walla and Copper Queen claims and is reported to be 25 ft. wide. The Comstock vein traverses the same claims and is six feet wide. The ores of both veins contain gold, silver, copper, and platinum. The wider vein has a pay-shoot four feet wide, with an estimated average grade of

Forty Nine tunnels are being driven ahead, the former in shipping ore and the latter in a good concentrating grade. The Forty Nine tunnel was driven as a cross-cut to tap the vein, and when the orebody was reached was continued as a drift. It is heading toward the high-grade ore which shows on the outcrop. Mr. Howson says that, if the transportation facilities were available, the property could be shipping now. The settlement is as comfortable as circumstances will permit, being laid out and built on modern plans, with baths, hot and cold water, and oil heaters, as well as the best of food and a good cook. There is also a completely equipped assay-office. As the first man went on the ground as late as July 1 last it is thought that a record of accomplishment has been made.

A large motor-sled ore-truck has arrived at Stewart for the Premier Gold Mining Co. This is expected to be the forerunner of a battery of the same, it being confidently anticipated that the truck will do the work for which it was purchased, namely, carry the ore over the winter trail from the mine to tidewater. It is likely that

GENERAL VIEW OF THE HIDDEN CREEK PLANT OF THE GRANBY COMPANY, OBSERVATORY INLET, B. C. FROM LEFT TO RIGHT: SMELTER, ENTRANCE TO 150 TUNNEL, No. 2 CRUSHER PLANT, MINE BUILDINGS, AND ENTRANCE TO 385 TUNNEL.

about \$70 per ton. The platinum content assays from \$2 to \$272 per ton. The only permanent workings are a 50-ft. shaft on the Walla Walla and a 37-ft. shaft on the Comstock vein. Out of a million \$1 shares, 343,000 are in the treasury. Stock is being sold for development and purchase of machinery, and also to purchase a piece of ground adjoining the southern boundary of the Walla claim, owned as an Indian allotment. A shaft-house, bunk-house, and cook-house are among the improvements. The Great Northern and Spokane and British Columbia railway depots are situated about 1½ miles distant, with a downhill haul. An adit 2000 ft. long will tap the big vein at a depth of 1000 ft., and an 1800-ft. adit from the base of the mountain will cut it at a similar depth. The property has a good reputation.

BRITISH COLUMBIA

NEWS FROM SALMON RIVER AND CARIBOO.

SALMON RIVER.—On the Forty Nine property development is being continued energetically and is expected to be maintained throughout the winter. H. Howson, who is in charge, states that both the Occidental and the

new hauling device will be tried out about the middle of December, as the heavy snow, as a rule, does not come until about that time. It is the intention to erect a compressor at the mine and then use air-drills. An electric-light plant has been installed and the bunk-house, cook-house, compressor-building, and ore-sorting shed are to be lighted by electricity. The wires will be carried to the mine entrance.

Other properties which, according to a definite statement, will be active this winter are the Big Missouri, Mineral Hill, and Bush, while it is considered likely that the New Alaska will be developed to some extent.

CARIBOO.—John D. Galloway, Provincial engineer for the North-Eastern Mineral Survey District, has completed his summer's field work and reports the outlook in the Cariboo district to be most encouraging. Robert Brice, and associates, several of whom are connected with the Mining Corporation of Canada, have 70 men doing exploration work on the Proserpine lode claims, which they bonded in the summer. Two diamond-drills have been ordered, and these will be started as soon as they arrive. Work will be continued through the winter, as a heavy payment on the property falls due in the early

spring, and it is essential that a thorough exploration should be made before then. Two orebodies are known to run through the claims, and these consist of belts of quartz intercalated with quartzite, the quartz being the carrier of the precious metal. Should Mr. Brice's explorations prove satisfactory and the property be purchased, it will mean a great deal for the district, as it is proposed to put in a hydro-electric power-plant that will be able to supply other mines in the neighborhood. Considerable placer exploration has been done on Antler creek, and Mr. Moore and his associates have made arrangements to operate at least one large dredge next spring. The great need of the district is railway communication. Mr. Galloway says a comparatively easy route could be found between Barkerville and the Grand Trunk Pacific that would necessitate only about 60 miles of track. This route could be made to open up a new coal-field on the way.

ONTARIO

NEW DEVELOPMENT COMPANY—MINES AT PORCUPINE STILL AFFECTED BY LABOR SHORTAGE.

A company under the name of Canadian-American Resources, Ltd., has been incorporated in Ontario with an authorized capital of \$50,000,000, the largest capitalization ever authorized in this Province. Its object is to develop the natural resources of the continent, more especially in connection with mining and oil enterprises. It will have offices in both Toronto and New York. It is intended only to acquire properties of value and operate them by the company itself, which will carry on its own refining processes. The officers are as follows: President, Alexander Alexander, New York; vice-president, L. E. Denyes, Toronto; secretary, Dr. R. Gordon Bogart, Kingston, Ontario; treasurer, George B. Leighton, New York; directors, Col. Jacob Ruppert, New York; George B. Gifford, New York; and S. W. Jenekes, St. Catharines, Ontario.

BUTT TOWNSHIP.—Since the discovery of radium some weeks ago, there has been an influx of prospectors and many claims have been staked. It is too late in the season for active development, so that the question as to whether radium occurs in commercial quantities is hardly likely to be settled for some time, but capital is already seeking investment in the field. The Mining Corporation of Canada has secured an option on 74 acres, adjoining the discovery, from Rinaldo McConnell at \$10,000, the first installment of which has been paid. Exploration of the property will be commenced as soon as possible.

PORCUPINE.—The gold-mining industry is still considerably handicapped by labor shortage and the leading mines are operating much below capacity. The expectation that the Hollinger Consolidated would resume the former dividend rate of 1% per month after January 1 now appears likely to be disappointed, as the management is inclined, so long as present conditions remain, to pursue a conservative policy. Arrangements are being made for the further exploration of the Moneta. Dia-

mond-drilling on the Keora has indicated some large orebodies. A mining plant has been purchased and development to a depth of 250 ft. will be undertaken. The Sovereign is diamond-drilling to tap an important vein discovered on the surface.

GOWGANDA.—The Trethewey has so far spent about \$80,000 in the development of the Castle property, this amount having been made good by the high-grade ore already extracted. On the original Castle property a new vein 11 in. wide with patches of high-grade is being opened up, and on R. C. 101 the shaft is down 60 ft., at which point the vein is 5 in. wide and stated to carry 4000 oz. per ton. The growing importance of the Gowganda and Matachewan fields has resulted in a plan for the development of electric power at Indian Chutes on the Montreal river, the final survey and plans for which are in course of preparation. It is 20 miles distant from Gowganda and 15 miles from Matachewan. It is expected that the line will be ready for operation in about a year. Definite announcement has been made that the Canadian Light Railway Construction Co. will proceed with the construction of a narrow-gauge railroad next spring from Elk Lake to Gowganda, a distance of about 27 miles.

COBALT.—The Northern Customs Concentrator Co. has completed the purchase of a part of the Chamber-Ferland mine of the Alladin-Cobalt Co. The reason for such a sale by the Alladin is the fact that its Chambers-Ferland property is not equipped with a mill and cannot treat the low-grade ore, a substantial tonnage of which is estimated to contain about 12 oz. of silver per ton. The operation of the Silver Cliff property, under lease to the Northern Customs Co., is resulting in net profits of about \$25,500 monthly. The enlarged case in connection with the Bailey-Cobalt litigation was heard in Osgoode Hall, Toronto, on November 19, decision being reserved. The control of the Buffalo mines has been sold to the Mining Corporation of Canada. A complete change in the directorate and the management is being made.

SONORA

ORGANIZATION OF THE BOSTON-MOCTEZUMA MINING CO.

The Boston-Moctezuma Mining Co. is being organized to take over from W. C. Humphrey and operate Guereguita mine, a silver property 20 miles south of Nacozari. The officials and directors are all Easterners, including Charles P. Vaughn, Ira Vaughn, Oliver Cutts of Philadelphia, and Lyman V. Banker of Newton, Massachusetts. The Guereguita was operated for several years by Mr. Humphrey and associates, large bodies of low-grade silver ore being developed. The average content of this orebody is said to be about \$10 per ton, and it is expected to lend itself well to concentration. Several thousand feet of development has been done in tunnels. Engineers are said to have inspected the property recently with the idea of arranging a plan for transportation and for construction of a large concentrator on the property. A wagon-road connects the mine with Nacozari, the nearest rail point, which with a small expenditure can be put in good condition for use of motor trucks.

ARIZONA

Hackberry.—It is reported that the Hackberry mill will be closed down as soon as the remaining broken ore is treated. The shut-down will continue until further development on the lower levels and a new shaft are completed. High-grade silver ore will be stoped and shipped as usual.

Kingman.—It is expected that cross-cutting from the main shaft of the Buckeye to the Rural mine, to drain the latter, will be possible within thirty days. The old Buckeye shaft and workings are almost clear of water. Two cross-cuts are being driven from the main tunnel level of the Buckeye to prospect parallel veins. —M. B. Dudley and associates have put men to work on the IXL mine, situated 14 miles north of Kingman, to prepare for unwatering and sinking the shaft another 150 ft. G. D. Atlee is superintendent. —The Berkeley mine in the Cedar Valley mining district has been optioned to T. N. Stanton and C. L. Jones.

Miami.—It is expected that the new mill of the Miami Mining & Milling Co. at Doak will be in operation the first part of December. It is the intention of the management to erect a second section of 10 stamps, amalgamating plates, and tables as soon as the first section is operating satisfactorily. The main tunnel is now in 560 ft. and is to be driven another 500 ft. at which point it is expected to cut No. 5 vein. The tunnel has opened ore which assays \$18 in gold besides considerable lead.

Prescott.—D. C. Cawley has sold his Centepede group of eight copper claims to an El Paso syndicate, a first payment of \$2500 being made. Development work is to be commenced at once.

Ray.—Operations have been started at the Kile-Truman property. The shaft is to be sunk 100 ft. below the present tunnel level, which has exposed 5 to 25% copper ore. A winze is also to be sunk on the ore encountered in the tunnel to prove its extent.

Tucson.—October operations of the El Tiro property were of such success as to warrant the declaration of a dividend. Shipments of one 50-ton car per day were maintained during the month.

Winkelman.—The Gila Copper Sulphide Co. has been given the decision in its case of breach of contract with the A. S. & R. Co. A year ago the A. S. & R. Co. refused to accept any further ore from the Gila Copper Sulphide Co., claiming that all ore purchased was done at a loss. A restraining order was obtained pending a decision. During the past year the Gila Copper Sulphide Co.'s operations were sufficiently successful to enable them to make a profit and raise enough money to pay off the bond holders, who threatened foreclosure.

CALIFORNIA

Brandy City.—The Brandy City Hydraulic Mines Co. has completed preparations for extensive mining and is awaiting the wet season. Twenty-five men are employed under the management of Warren Godfrey. Extensive areas of proved rich ground are ready for the giants. Debris will be impounded by the restraining dam constructed on North Yuba river last summer.

Piedra.—G. S. Lane and Henry Nolte have taken a lease

on the Ward magnesite mine near Piedra. The product will be delivered by truck to the kiln at Piedra, which is to be operated by Sinclair brothers.

Yreka.—S. H. Gillette has sold his placer holding at Garvey's bar on the Klamath river to J. B. Johnson of Benicia. The property has been worked several years and produced considerable gold. The new owner plans operations along broader lines.

IDAHO

Coeur d'Alene.—The Federal Mining & Smelting Co. asks for a redress of \$6,000,000 from the Hecla Mining Co. for ore mined in the Russell claim and Russell vein of the Federal company, according to a suit filed in the United States court at Coeur d'Alene. The Federal also asks that the Hecla company be required to set forth its claims that they may be determined by the court, that the Hecla be enjoined from asserting any claim whatever to the Russell lode in which the vein is said to apex, and that the Hecla be restrained from further penetration of the vein, and be required to give an accounting of the ore already extracted, as well as be perpetually enjoined from further penetration of the vein.

The Hecla Mining Co. has declared its regular quarterly dividend of \$150,000. The declaration is at the rate of 10c. per share on an issue of 1,000,000 shares. Payment will be made on December 28 to stockholders of record on December 1. This payment will raise the grand total of disbursements to \$7,855,000, of which \$600,000 will have been disbursed in the current year. The surplus has been estimated unofficially at \$2,000,000, including the sum subject to income tax.

Wardner.—Concerning the resumption of work by the Wardner Leasing Co., under the town of Wardner, J. D. Owens, secretary, says: "We will first unwater the shaft, which is down about 200 ft., and then will extend the drift from the bottom of the shaft, which is about 200 ft. long. We believe we will catch the lode that crosses Milo creek, on the ground covered by our lease, and when this lode is reached we expect to find a large body of ore."

The Caledonia Mining Co. has declared its regular monthly dividend of \$26,050. This is at the rate of a cent a share on the issue of 2,605,000 shares. Payment will be made on December 5. The forthcoming disbursement will increase the total payments for the year to \$312,400 and the grand total to \$3,985,650.

MONTANA

Mineral County.—Several mining properties are being opened in Mineral county and just over the divide in the St. Joe and Clearwater districts in Idaho, and throughout the district there are signs of a return of at least a portion of the old-time activity.

NEVADA

Fallon.—L. W. Grehore, of the Fallon Oil Field District Association, has issued an official statement denouncing reports that oil had been discovered in the field. The story was circulated by promoters having headquarters at Reno, who declared that one well was flowing three to ten barrels daily, and another was spouting oil and gas. The official

statement is to the effect that no oil has been found anywhere in the field, aside from seepage, and that such reports are certain to handicap legitimate exploration.

Rochester.—Rochester Mines Co. has signed an agreement with employees providing for payment of a bonus with each advance of silver above \$1.20 per ounce. The bonus ranges from 25 to 50c. per day, based on price fluctuations of silver for each month. With silver at, or below, \$1.20 the regular wage scale of \$5.50 for machine men and \$5 for miners prevails. The agreement is effective until May 1, 1920. Conditions in the mine are reported satisfactory, with the improved mill effecting an excellent metal recovery. C. A. Bennett is general superintendent.

OREGON

Medford.—The Bolen Creek Mining Co., in which a number of Medford people are interested, has been organized under the laws of Arizona and capitalized at \$150,000. The office of the company is in Medford with Porter J. Neff as attorney-in-fact for the concern. Its gold placer mine is located on Sucker creek in the Holland district of Josephine county, 30 miles west of Medford. The mine is now being equipped for operation.

WASHINGTON

Chewelah.—The United Silver Copper mine is now producing 250 tons per day of milling ore, from which 6 to 8 cars of flotation concentrate and one car of high-grade table concentrate is shipped monthly. In addition from 50 to 150 tons per month of high-grade ore is shipped direct. The mill consists essentially of tables and a flotation unit. It has recently been remodeled and is now doing good work. The mine is 1400 ft. deep, and is opened by a cross-cut 4200 ft. long. The ore is described as being a "big little vein", narrow but persistent. Gasoline haulage is used, the ore being hauled in trains of from eight to ten 1½-ton cars. Development at present is opening ground in the upper levels that was left behind when the mine was first opened. This ground is expected to produce good milling ore. Oscar Lachmund is general manager.

BRITISH COLUMBIA

Trail.—Ore receipts at the smelter of the Consolidated Mining & Smelting Co. were 5593 tons for the week ended November 14. This is a heavy increase over the week before, when the total was 4238 tons. The total for the year is now 285,258 tons.

Receipts for the week and to date this year are as follows:

| | Week | Year |
|---|------|---------|
| Alamo mill, Alamo | 54 | 347 |
| Bluebell, Riondel | 92 | 1,357 |

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Arthur Winslow is at Telluride.

H. R. Plate has returned to San Francisco from New York.

H. A. Megraw passed through San Francisco on his way to Arizona.

J. I. Brown has moved from Thane, Alaska, to Seattle, Washington.

H. R. Wagner, of the A. S. & R. Co., has returned to New York from Mexico.

A. W. Clapp, formerly of Pasadena, California, is now at Tonopah, Nevada.

E. R. Abadie is superintendent of the Blue Mountain gold mine at White River, California.

E. H. Leslie, representative of the 'M. & S. P.' at Chicago, is in San Francisco this week-end.

Thomas J. Ryder has given up his Mexico City office, and is now at 65 Broadway, New York.

K. A. Hinde passed through San Francisco on his return from Ekibastus, in Siberia, to London.

Charles Bocking, assistant manager for the Butte & Superior Mining Co., has been in New York.

Charles E. Prior is assistant manager for the Exploration Syndicate No. 2, at Cherry Creek, Nevada.

Frank Daniels, of Pasadena, is on his way home after a mine examination in Mineral county, Nevada.

I. B. Fabrikant, recently with the Mount Lyell company, has arrived in San Francisco from Melbourne.

H. S. Lyne has left Salmo, B. C., and will visit Palo Alto, California, before proceeding to South America.

W. M. Summerhayes, manager for the Bluestone Mining & Smelting Co., at Mason, Nevada, is at the Palace hotel.

Kent Roberts has resigned as superintendent for the Hill-side Fluor Spar Mines, at Elizabethtown, Illinois, and is now at Chicago.

Will H. Coghill, of the U. S. Bureau of Mines, has been transferred from the Experiment Station at Seattle to that at Golden, Colorado.

Frank O. Jasmer is with the Companias del Agwi, of Tampico, Mexico, constructing a sea-loading crude-oil pumping station in the State of Vera Cruz.

J. D. Shilling has become general superintendent of mines for the Utah Copper Co., and his son, **J. D. Shilling, Jr.**, becomes superintendent of mines for the company.

Horace V. Winchell, president of the American Institute of Mining & Metallurgical Engineers, will address the San Francisco section on Tuesday evening, December 22.

Thomas Varley, metallurgist in charge of the U. S. Experiment Station at the University of Utah, has returned to Salt Lake City from a short trip to Moscow, Idaho, and Butte, Montana.

Thomas H. Tulloch has resigned as general superintendent for the Chestatee Pyrites & Chemical Corporation to accept a position with the American Venture & Mines Corporation at Thomson, Georgia.

R. G. Knickerbocker has been appointed by the Messina Transvaal Development Co., Ltd., to supervise the erection and direct the operation of its powdered-coal reverberatory smelting and copper-refining furnaces at Messina, in South Africa.

W. H. Freeland, formerly manager for the Ducktown Sulphur, Copper & Iron Co., Ltd., died in St. Luke's hospital, San Francisco, on November 22.

EASTERN METAL MARKET

(By wire from New York)

December 2.—Copper is weak. Lead is quiet and firm. Zinc is quiet and strong.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver \$99 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

MONEY AND EXCHANGE

Foreign exchange continues to be demoralized, the pound sterling hovering around the four-dollar mark, with frequent recessions below that level. The rejection of the Treaty has received a good deal of emphasis as one of the primary causes for this, but much doubt is expressed by many financial critics as to the soundness of that idea. The obstacles in the way of the stabilization of foreign exchange are so great that, although the ratification of the Treaty would undoubtedly be reflected by more favorable rates, it is unlikely that it would cause the improvement apparently expected by many people. The latest United Kingdom offering in this country was not very well accepted, which does not forecast great success in floating other foreign loans here.

Although it is not generally believed that the so-called Davison plan for extending credits to European countries has been abandoned, bankers at the moment are patiently waiting for the atmosphere at Washington to clear before any further steps can be taken in the matter. Some bankers believe no plan for foreign financing will be successful, even if taken under the Edge bill when passed, unless the United States government lends its active support in one shape or another. But the Washington authorities take an entirely different view, as appears from the following extract from the November issue of the federal reserve bulletin:

"During October there has been further agitation in behalf of Government support of export financing. Two arguments are advanced in support of Government participation or maintenance of this kind of financing: That otherwise the financing will not be done and that consequently meritorious requirements whose satisfaction is necessary in order to bring about the restoration of political order will not be made; and that unless such provision is made other countries will take advantage of our hesitation and will occupy the foreign market to the exclusion of the American exporter.

"These two arguments are mutually self-destructive, since the first is based on the belief that unless the United States supplies the credit necessary to facilitate the movement of goods abroad, it will not be furnished, while the latter is confessedly founded upon the view that other countries may be in position to anticipate our action in the maintenance of the sale of our goods abroad. In any event, it is the declared policy of Congress no longer to accept the task involved in foreign financing, but to pass this work to private hands. That not a few representative American financiers believe this policy to be wise has been indicated by the expression of opinion at the international conference meeting at Atlantic City during the week ended October 25."

In announcing the offering of two new 4½% Treasury certificate issues, one of them in anticipation of taxes, Secretary of the Treasury Glass says: "In my letter of September 8, I stated that while it could not be said definitely when semi-monthly issues of loan certificates would be resumed, such issues would certainly not be resumed before October 15. Though most factors in the general situation since then have been adverse, the position of the Treasury has developed more favorably than there seemed any reason to hope. The great success of the issue of the tax certificates then announced, the reduction in current expenditures, and the increase of receipts, notably from sales of war materials and supplies, have made it possible to avoid until now the resumption of issue of certificates."

Quotations on December 2 are as follows:

| | |
|-----------------------|-------|
| Sterling: Cable | 3.96% |
| Demand | 3.95 |
| Francs: Cable | 12.00 |
| Demand | 12.05 |

Eastern Metal Market

New York, November 26.

The markets are generally quiet and featureless, with prices in most cases easy to firm.

Copper prices have further weakened.

The tin market has been quite active, buying for future shipment predominating.

Dullness characterizes the lead market, with prices firm.

Buying of zinc has been light, but the market is fairly firm.

Antimony is unchanged.

IRON AND STEEL

The market is under the influence of the efforts of manufacturing consumers to provide against the scarcity of steel that is in sight for part of 1920, and of the policy of leading producers to keep from overselling and to hold prices in check. Despite the coal strike situation the large steel companies have maintained output and there have been some further gains from the return of strikers to work. Loss of output, due to the steel strike, is estimated at 2,500,000 to 3,000,000 tons of finished material. Railroad buying is looming up to compete with regular consumption, and the demand for steel plates for shipbuilding is growing. Structural business also is expanding. Premiums are offered for plates, bars, and particularly sheets, and pig-iron continues to advance. Even the scrap market is active and prices are soaring.

COPPER

Fairly active competition for such little business as is offered has further depressed the market. Some of the large producers, as well as outside interests, have freely competed for the business going, with the result that electrolytic copper can be bought anywhere from 19 to 19.25c., New York, with Lake copper largely nominal at 19.50 to 19.75c., New York, both for delivery this year. An interesting estimate places the average month's production of refined copper this year at 125,000,000 lb. per month, with exports averaging 43,500,000 lb. This would leave for domestic consumption about 81,500,000 lb. each month. It is believed, however, that consumption here has not averaged over 70,000,000 lb. per month. This would show that 100,000,000 lb. has been added to surplus stocks since January 1. This will explain to some extent why prices have fallen and continue to turn that way. Late reports are that electrolytic copper has sold down to 18.75c. today for early delivery.

TIN

Early last week the market was quiet, but toward the end of the week there were liberal sales, mostly for future shipment—November, December, January, and February—from the Far East. In all about 1000 tons was booked, at prices ranging from 52.12½ to 52.75c. Since then the market has advanced, due to a rapid rise at London and also to the improvement in exchange. The London advance is ascribed partly to the heavy buying here. The last quotations here yesterday were 54c. for future shipment from England or from the Straits, with spot delivery at 54 to 54.25c. Not much prompt metal was sold, but consumers and dealers were the principal buyers last week for future shipment. Tin arrivals thus far this month have been 3305 tons, of which 1000 tons came in at Pacific ports. The quantity afloat is 3615 tons. The last quotation for spot Straits at London was £292 10s. per ton.

LEAD

The market has been quiet. There appears to be no anxiety to buy and business has been light. A few resale

lots have been offered at New York at 6.75c. The leading interest continues to quote 6.75c., New York, and 6.50c., St. Louis. The outside market at St. Louis is slightly higher than that of the Trust. We quote the market at 6.75c., New York, and 6.55c., St. Louis. Underlying conditions are regarded by the trade as favorable and satisfactory.

ZINC

This market has been largely influenced by the foreign situation. Because of an advance in the price of zinc in London and because sterling exchange also improved, the quotation for prime Western here also rose this week. Today this grade is quoted at 7.85c., St. Louis, or 8.20c., New York, for this year's delivery. Demand, both foreign and domestic, is light. The decline in prices the last few days did not bring out much buying, indicating that galvanizers and others are fairly well supplied under present conditions.

ANTIMONY

The conditions are unchanged and the metal is quoted at 9.25c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

Virgin metal, 98 to 99% pure, is unchanged at 32 to 33c., New York, for wholesale lots for early delivery.

ORES

Tungsten: The market is lifeless and prices are nominal at \$7 to \$10 per unit in regular concentrates. Some Chinese ore, about 65 tons, has been offered at the Pacific Coast at \$7 per unit. Ferro-tungsten is probably obtainable around \$1 to \$1.25 per pound of contained tungsten, but no test of prices is reported.

Molybdenum: A little more inquiry has appeared, but the market as a whole is quiet with quotations nominal at 75c. per pound of MoS₂ in 90% concentrates.

Manganese: Quotations are nominal at around 50c. per unit. Imports in September were 19,601 tons, making the total to October 1 this year 269,411 tons. This compares with 382,382 tons to October 1, 1917, and 494,633 tons to October 1, 1918. Brazil furnished 203,132 tons of the 1919 imports to October 1.

Manganese-Iron Alloys: American producers of ferro-manganese have advanced their quotation from \$110 to \$120 per ton, delivered. A substantial business has been booked at \$110 and there are liberal inquiries for delivery in 1920, which it is expected will be booked at \$120. British makers are still out of the market. Business in spiegeleisen is brisk, with sales up to 6000 tons reported, mostly for domestic consumption and with sizeable inquiries still before the market for foreign and domestic use. Germany has been obtaining American spiegeleisen through Holland. The domestic market is \$36 to \$45, furnace, depending on the seller.

There has been a fair volume of copper business done during the past few weeks, but some of it has been handled in an unusual manner. The business booked has not been entirely to consumers, but to and through smaller agencies and second hands, indicating that the metal sold to dealers must eventually come on the market again. The policy adopted by some of the larger producing interests has been to lighten ship, and where consumers were not interested to utilize brokers and other agencies. Sales into actual consumption have been moderate.

Book Reviews

The Condensed Chemical Dictionary. Compiled and edited by the editorial staff of the 'Chemical Engineering Catalog'. F. M. Turner, Jr., technical editor; D. D. Berolzheimer, W. P. Cutter, John Helfrich, assistant editors. Pp. 525. The Chemical Catalog Co., New York. For sale by 'Mining and Scientific Press'. Library buckram, price \$5. Flexible leather-cloth covers, thumb index, \$6.

The growth of the chemical industries and their increasing importance in affairs has brought into our daily language many names and terms but dimly understood by those not trained in chemistry. Such men as exporters and importers, purchasing agents, lawyers, and insurance companies have frequent need for detailed information regarding chemicals and chemical products. This book was designed largely to meet the needs of these non-technical men, and yet even the professional chemist could hardly hope to know much of the detailed information that is contained in it. The idea was to furnish, in a compact form and so arranged as to be quickly found, the outstanding facts regarding the chemicals and chemical materials ordinarily met with in commerce. With this end in view, such information as fire hazard, railroad shipping regulations, containers, and grades manufactured, has been included. Methods of manufacture and purification are briefly stated, although it is obvious that within the limits of a dictionary such information must be merely an outline and cannot be treated in detail. Uses, solubilities, constants (specific gravity, melting-point, boiling-point, etc.), color, ordinary properties, and chemical formula are given for each item. Although we fully appreciate the difficulties that would have attended an enlargement of the scope of the work to include anything so unstable as prices, yet we believe that a book compiled largely for the use of those interested in chemicals from the commercial view-point would have gained by the inclusion of such information, however broad the limits of such prices would need to be. Many of those who find the book useful will undoubtedly be puzzled to judge whether a chemical sells for approximately \$10 per ounce or 5c. per pound. With that reservation, the book is excellent. The arrangement is alphabetical with liberal cross-references, and any required item can be quickly and easily found. There is ample space on each page for marginal notes by the user. The work closes with a series of convenient tables. We can commend this book to all those who require quick access to the salient facts regarding the large number of chemicals used in manufacturing and laboratory work. Although it is addressed to and will find its greatest use in the hands of the non-technical man, it will undoubtedly be of value also to the professional chemist, who will be able thus to look up quickly much information that he requires without spending the time needed to consult his more cumbersome works of reference.

The Physical Chemistry of the Metals. By Rudolph Schenck. Translated and annotated by Reginald Scott Dean. Pp. 239 + viii, ill., index. John Wiley & Sons, New York. For sale by 'Mining and Scientific Press'. Price, \$3.

This book is the outgrowth of a series of lectures by the author, who is professor of physical chemistry in the Technischen Hochschule at Aachen, delivered in 1907 before the engineers of the Rheinisch industrial district. The object of the lectures was to demonstrate the use of chemical statics and the underlying reasons for many smelting operations and metallurgical processes. In the German edition, which was published in 1908, especial care was taken to develop the principles of equilibrium. Many hitherto unpublished facts were incorporated, including the equilibrium between

the various components of steel, the quantitative determination of amorphous carbon and graphite, and the investigation of the sulphatizing roast. In this first English edition the translator, who is research metallurgist to the American Zinc, Lead & Smelting Co., has changed the book from lecture to text-book form and brought it thoroughly up to date. Many additions have been made to the text and all numerical data revised according to the latest accepted values. Although this work makes no pretences to being an exhaustive treatise, it goes into the various branches with a thoroughness sufficient for the use of any except the advanced research specialist. It will be especially valuable to metallurgists, metallographers, and students in these and allied subjects. Exposition of the electron theory has been omitted as hardly warranted by the scope of the work. We find this book a clear and orderly presentation of a subject that is too little understood by engineers in general, and believe that many would have their understanding of metallurgy and associated fields increased to a valuable extent by a careful reading. The chapters on alloys are particularly good, and are illustrated with many illuminating diagrams and micro-photographs. The only fault we have to find is with the index, which is a mere skeleton, and not at all up to the rest of the work. This can be an exasperating defect when a book is used for reference.

Opportunities in Chemistry. By Ellwood Hendrick. Pp. 102 + x. Harper & Bros., New York. For sale by 'Mining and Scientific Press'. Price, \$1.

This little book is an attempt, by one well qualified to undertake the task, to explain in simple and attractive language the broad field of modern chemistry. It is written for those who have no previous knowledge of the subject, but who would like to know something of what chemistry is and how it affects us in our daily life, whether their object is merely the gratification of a simple curiosity, or a search for guidance in deciding as to the advisability of chemistry as a career. With this in view, the author discusses briefly several of the typical industries of modern times, and the manner in which research chemistry has been applied to their study in order to simplify processes and improve results. Agriculture and steel-making, what fuel is, and why soap cleanses, each comes in for its share of entertaining and instructive comment. And although the book is not intended for those versed in chemistry, yet the attractive and sometimes whimsical method of outlining the many fields into which this useful science is poking its inquisitive fingers can hardly fail to be of interest to anybody. For the young man hesitating on the choice of a career it should have many valuable hints, and for the business man who wishes to increase his general knowledge it will provide the means of passing a pleasant hour. At the end are listed three or four books that offer further and more detailed study to the reader whose interest has been aroused.

Antimony: Its Chemistry, Metallurgy, Uses, Etc. By Chung Yu Wang, M.A., B.Sc. Second Edition. Pp. 217 + x, with numerous illustrations and index. Charles Griffin & Co., Ltd., London. For sale by 'Mining and Scientific Press'. Price, \$5.

This belated reprint of the standard treatise on antimony will be welcomed by many who, since the exhaustion of the first edition, have found themselves unable to purchase copies. It is the only treatise on antimony of which we are aware; the treatment, as many already know, is exhaustive and the style concise and lucid. In this many whose native language is English might obtain a lesson from the brilliant Chinese author. Each chapter is followed by an exceptionally complete bibliography, the number of languages represented in the periodicals testifying to the difficulty of collect-

ing so much scattered information on antimony into one orderly volume. The metallurgy of antimony receives the most space, 80 pages being devoted to this important branch of the subject. This chapter is profusely illustrated with drawings of furnaces and retorts. Antimony preparations and their uses are also treated at length, including many tabulations of alloys and methods of preparing them. Other phases that receive adequate attention are the history of antimony, its chemistry and mineralogy, the geological occurrence of the ores, the analysis of antimony compounds, the production and valuation of antimony ore, and the principal mines and smelting works of antimony. This book is indispensable to anyone who wishes to acquire a thorough knowledge of antimony and its compounds, or who wishes an authoritative work of reference. In its present form it is not, strictly speaking, a second edition, as it has not been revised, but a reprint of the first edition, made necessary at this time by the growing demand, which could not be satisfied during the War.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

A NEW PORTABLE AIR-COMPRESSOR

Portable compressors of many varieties have been developed in the few years just past, each successive design bettering the one which preceded it. Now there appears a new type. The Ingersoll-Rand Co. has introduced a light-weight gasoline-engine driven unit, built in two sizes, to be known as the Imperial Type 14 portable compressor. These are all-steel outfits, from their sheet-steel canopy to

118-cu. ft. Imperial Portable Compressor

the broad tired steel wheels. The power plant of each consists of a duplex, vertical-compressor, driven at high speed, by a four-cylinder, four-cycle, tractor-type gasoline-motor. It is pointed out that the outfit, being designed especially for portability, has had unnecessary weight eliminated, and affords maximum air-power output per unit weight. The larger machine, of 210 cu. ft. capacity, weighs only 6000

Sectional Power-Plant 118-cu. ft. Portable Compressor

lb., and the 118 cu. ft. unit 4000 lb. A point is also made of the fact that the gasoline-motor drive provides power in an economical form and by a mechanism that can be confidently entrusted to the average operator, for men familiar with gasoline engines are everywhere available and make thoroughly competent engineers.

The compressors have cylinders cast 'en-bloc', with cylinder heads, valve chambers, and water jackets integral. Both intake and discharge valves are of the plate type and are situated directly over the cylinder bore. Crank shafts and

connecting rods are drop forgings. Air pistons are fitted with three-piece piston rings and, in addition, with an oil-wiper ring. This latter returns all surplus oil from the cylinder walls to the crank case, and is claimed to obviate the difficulty caused by having the air carry an excess of oil into the receiver. All bearings are die castings of anti-friction metal. Hand holes in the crank-case permit convenient access for adjusting main bearings and those of the crank-pins. All parts are lubricated by splash from an oil reservoir in the crank case. The compressors are provided with inlet unloading devices which automatically close the compressor intake when the receiver pressure rises above a predetermined limit, and permit the machine to again take up its load when the pressure has fallen a definite amount.

The gasoline driving-motors are of long-stroke type, and operate at medium speed. They are equipped with high-tension, magnetic ignition with automatic governors to main-

210-cu. ft. Imperial Portable Compressor

tain constant speed under all working conditions and to prevent overspeeding when idling. A splash oiling system lubricates all moving parts. Starting crank is located at the front of the machine beneath the radiator. Both compressor and driving-motor are water cooled by a circulating system, with centrifugal pump, large radiator, and powerful blast fan. The manufacturer directs attention to the fact that the radiators are made up of removable sections, a construction that allows the removal and repair of a damaged section without taking down the entire radiator or interrupting the use of the compressor.

Each of these units is equipped complete with receiver, safety valve, drain valves, pressure gauge, and service valves to which the air hose lines may be attached. When the fuel tank has been filled, lubricating oil provided, and the cooling system supplied with water, the units are ready for work. The mounting is worthy of note, particularly the swiveled front axle, which moves freely in both horizontal and vertical planes. This, with the rigidly attached rear axle, gives three point suspension, and permits the outfit to pass over inequalities of the ground without any racking effect or misalignment of the power plant.

The two sizes differ in respect to the situation of the air receiver, and in minor details of design. These differences, in general, can be seen from an inspection of the accompanying illustrations.

COMMERCIAL PARAGRAPHS

'The Clutch that Clutches' is the title of a 16-page booklet on the subject of Medart friction clutches, just issued by the Medart Patent Pulley Co., St. Louis.

Walter Hasendahl, formerly in charge of the Allis-Chalmers Mfg. Co.'s district office in Los Angeles, has entered the firm of **Rosenburg & Co.** as their consulting engineer.

C-H space heaters are illustrated and described in a new four-page two-color 8½ in. by 11 in. pamphlet No. 479, entitled 'Miscellaneous Applications of Electrical Heat'. The pamphlet emphasizes numerous applications of electrical heat by means of flat standardized heaters, 2 ft. long, ⅜ in. thick, and 1½ in. wide. Copies may be obtained by addressing the **Cutler-Hammer Mfg. Co.**, Milwaukee.

A new bulletin on centrifugal pumps and centrifugal pumping units has been issued by the **Allis-Chalmers** company. As the manufacturers state, the centrifugal pump has been so perfected in design and improved in efficiency that it is now worthy of serious consideration for practically any class of pumping service. The bulletin contains 50 pages 8 by 10 in. Single and multiple-stage as well as typical installations are adequately illustrated and described. Many useful tables and curves are included, together with a set of instructions for installing and operating horizontal centrifugal pumps.

The **Chesapeake Iron Works**, of Baltimore, Maryland, manufacturers of Chesapeake electric traveling cranes, have announced the opening of their New York office in the Woolworth Bldg. The office will be in charge of H. L. Mode. Although the Chesapeake cranes are standardized, they are made in all types and sizes in any capacity, to meet every service condition. Chesapeake cranes were selected by the U. S. Government and over forty-five were used by the Base Ordnance Department in France during the War.

'Heat Insulations' is the title of a bulletin which contains an elaborate discussion of the economies possible with the proper insulation of steam generators and conductors in power-plant practice. It contains a theoretical discussion of the insulation of heated surfaces and its results in the saving of fuel, and shows how the fuel user can figure losses and how to overcome them and secure the best material for every condition that presents itself. There is also calculated the actual saving in dollars and cents on a year's basis that is possible by the proper insulation of heat surfaces. This catalogue presents in a concise and clear manner the subject of heat insulations in a form that makes the data easily available for the man on the job. It also contains detailed descriptions of the different classes of insulators used for various kinds of work and a discussion as to how to select a type of insulator best adapted to the work in hand. A copy will be sent gratis upon application to the **Franklin Mfg. Co.**, Franklin, Pennsylvania.

The firm of **Collins & Webb, Inc.**, of San Francisco and Los Angeles, are now the agents for the **Fate-Root-Heath Co.**, manufacturers of Plymouth gasoline locomotives. Collins & Webb have the exclusive sale of Plymouth locomotives in California, western Arizona, and Nevada, and also the Pacific export business. Plymouth locomotives are being used by the following California companies: The Southern California Edison Co., which uses two; the San Joaquin Light & Power Co., which uses two in its construction work; the Western Salt Works of San Diego has just installed a new one; the State of Arizona has just purchased one; the Inyo Development Co. at Keeler, California, has one; the Lincoln Clay Products Co. at Lincoln, California, operates one; the 88 Mining Co., New Mexico, is running a Plymouth locomotive; and also the Pacific Coast Borax Co. in Death Valley. The West End Con. Mining Co. operates two at its

mine near Searles Lake. Collins & Webb will be glad to supply illustrated bulletins detailing performance and records of Plymouth locomotives.

The **McMyler-Interstate Co.**, of Cleveland, Ohio, has opened offices in San Francisco, in charge of L. A. Somers. The McMyler-Interstate Co. is a merger of the McMyler Manufacturing Co. and the Interstate Engineering Co. These two companies have an uninterrupted combined history of about 35 years in the manufacture of coal and ore-handling machinery, locomotive cranes, shipbuilding cranes, car-dumpers, pile-drivers, railroad equipment, clam-shell, scraper, and orange-peel buckets. The McMyler-Interstate Co. has contributed some notable aids to the solution of mechanical engineering problems, chief of which, perhaps, may be mentioned a 350-gross-ton capacity fitting-out crane. This crane, which has a capacity of 392 net tons, is probably the largest crane of any that has ever been built. It is electrically operated, and therefore possesses interest for electrical as well as mechanical engineers. It is now being erected in the Philadelphia Navy Yard. A special bulletin describing it in detail will shortly be issued. Mr. Somers will be glad to supply copies as soon as it has been issued. Requests should be mailed to the McMyler-Interstate Co., 407-09 Merchants Exchange Bldg., San Francisco.

The **Milliken Brothers Mfg. Co., Inc.**, Woolworth Bldg., New York, has published a new catalogue (No. 10) descriptive of Milliken buildings. Structures of this type are built under the standardized-truss unit system, designed by the company. It makes use of a small, interchangeable, standardized structural steel unit; the buildings are all-steel, permanent and fireproof, and are furnished complete. They are suitable for all classes of industrial and manufacturing structures. The system makes possible low transportation and erection costs, allowing the choice of many buildings, all constructed under the same unit type. The catalogue is 8½ by 11 inches, and profusely illustrated with buildings of this character erected for the United States government and other important interests. Space is also given to the transmission towers, radio towers, and special poles built by the company. A companion book of like size, known as Catalogue No. 11, has been issued as an erection handbook; this forms a complete guide to the construction of any Milliken building from foundation to roof. Copies of these catalogues may be obtained free from the company by those interested.

Catalogue A, 1919, of **C. F. Braun & Co.**, manufacturing mechanical engineers, San Francisco, is an 80-page 8½ by 11-in. book of exceptionally handsome appearance. Printed throughout on a heavy coated paper, the many half-tones and line-cuts come out with a clean-cut detail that is not often found in catalogues. This catalogue, according to the Braun company, is offered as a compact reference for those interested in auxiliary machinery, and illustrates and describes briefly the Braun products, their merits and applications. Aerators, wet and dry vacuum condensers, cooling-towers, evaporators, expansion-joints, pressure and gravity filters, heaters, pipe anchors and guides, centrifugal pumps, valves, and many other forms of mechanical equipment are taken up in detail. This is, however, a condensed catalogue, intended to summarize all the Braun products. For those who are interested in special products, individual bulletins are issued, which will be forwarded on request, each describing fully the construction of each type of apparatus. A unique feature of catalogue A is a part describing and illustrating the organization and facilities of the Braun company. This has been included on the theory that the manufacturing methods and facilities employed by a builder of machinery are of vital concern to the purchaser, as they largely determine the reliability, efficiency, and life of the finished product.

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.

Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.
Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, \$4; Canada, \$5; other countries in postal union 25s. or \$6.

The latest Wilfley Table, No. 11-D. Concrete foundations and fully enclosed self-oiling head motion.

Heusser Balance, showing multiple weight attachment and pan extractor.

The Marcy Ball Mill—the giant of all grinding equipment. Capacities of single Marcy Mills have exceeded 800 tons per day—with low cost.

Production and Profit at any of these prices

The fluctuations in the prices of copper are typical of the fluctuations in the prices of other metals—typical of the conditions which Massco products have met successfully for a long period of years.

MASSCO PRODUCTS

Count on Massco products—whether for record production at high metal prices or for good profits on the narrow working margins of low prices.

The long experience of Massco engineers in solving the problems of the past certainly fit them to be of real help in the future—look to Massco products for profitable production and to Massco Service for satisfaction.

These are a few of the Massco Specialties:

Wilfley Concentrating Tables—single and double deck

Marcy Ball Mills

Assay and Laboratory Equipment

Massco Furnaces and Oil Burners

Sackett Sand Pump

Holman Stretcher Bar Hoist

Electrical Equipment

Pierce Amalgamators

Perfection Oil and Acid Feeder

The Mine & Smelter Supply Co.

A Service Station Within Reach of You

New York Office: 42 Broadway

AT the recent annual meeting, in London, of Minerals Separation Ltd., it was announced that Mr. John Ballot had resigned as chairman and managing director on account of his absorption in the affairs of the North American branch of the company's business. He is president of the American corporation. A vote of thanks to Mr. Ballot for his past services was carried by acclamation. At this meeting the share capital of the company was increased by 450,000 new shares, increasing the total to £500,000. Of these, 50,000 are to be issued at a premium of £1 per share *pro rata* to the present shareholders. This will be in the nature of a bonus, says 'The Mining World', because the price on the market is nearly £16 per £1 share. It was also announced at the meeting that patents have been obtained on two discoveries of great importance, opening up a glorious future for the company.

SEVERAL months ago we referred to the selection of a president of the University of California and discussed the qualifications needed for an appointment that we regarded as of the greatest importance not only to this State but to the entire Pacific Coast. After much delay and deliberation, the Board of Regents has selected Mr. David P. Barrows as president. We take pleasure in recording the fact, and congratulate both him and the University upon the appointment. The new president is a Doctor of Laws and a Lieutenant Colonel; he is a man of scholarly attainments and of virile activity; he has been an educator in the Philippines and a soldier in Siberia; he was elected recently as the chief of the Californian division of the American Legion and for two years he was dean of the faculties of the University. A good speaker, an engaging personality, a man of robust character, he brings to his work the qualities that it needs. We wish him every success in his administration and a long career of usefulness to our community.

FROM New York comes the statement that Messrs. Herbert C. Hoover, Julius H. Barnes, and Charles R. Crane have purchased the Washington 'Herald'. Mr. Crane is a son of the founder of the Crane Company of Chicago; in 1909 he was appointed Ambassador to China under the Taft administration, but resigned on the eve of sailing for his post; he was vice-chairman of the financial committee supporting President Wilson's campaign in 1912; he now ranks as a Democrat; he is a man of wide travel and is exceptionally well-informed concerning European politics. Mr. Barnes is head of the Wheat

Corporation organized under the Fuel Administration. The 'Herald' not long ago was owned by the brewers trust and lately by Mr. Arthur Brisbane, henchman for Hearst. The news of this sale is interesting, because, of course, it is a step taken in preparation for the Presidential election and suggests work in behalf of a third party. Mr. Hoover's friends know that he considers the present party cleavage out of date and thinks the time ripe for a new party, a Liberal party. Speaking of these matters, we hope the day may come when the candidates for the Presidency and for other positions of great responsibility, requiring executive ability, will be chosen from among those not pre-eminent for the gift of oratory. The modern world is swamped with talk and would gain greatly by choosing as its leaders those who do more and talk less.

IN one of our local dailies we note an editorial paragraph which, among other things, states that "the cost of prohibition to the people of the United States will be about \$500,000,000 annually, due to loss of revenue and expenditures for enforcing the law." We further learn that all but a small part of this is loss of revenue. The peculiar grasp of economics evinced by the writer of the paragraph is as remarkable in its way as the series of blunders committed by the liquor interests in their badly organized attempts to protect themselves against the inroads of the prohibitionists. We congratulate the scribe on advancing an entirely new theory regarding the abolition of the liquor traffic; among the various arguments that have been hurled against prohibition, we do not recall any previous ones that claimed it would be an expense to the country. The idea that the loss of taxes that were paid to the Government on a luxury will be an expense to the people is novel; whatever prohibition may or may not do, we imagine that, when the ledger is balanced, as far as expense is concerned, it will have no difficulty in justifying itself. We regret the general aridity—at times it is painful personally—but let us not 'kid' ourselves with such buncombe.

EXPORTS of copper during the first nine months of the current year amounted to 394 million pounds, as against 612 and 847 millions respectively during the equivalent period of 1918 and 1917. In value these exports were even wider apart; in 1917 they were worth 256 million dollars, and in 1918, 160 million dollars, as compared with only \$90,481,732 in the nine months of

the current year. Meanwhile the cost of producing the metal is increasing steadily, owing principally to the higher wages paid to those engaged in the production. The Utah Copper gives 14.88 cents as its average cost during the third quarter, as against 11.59 and 13.72 cents in the two preceding quarters. The Nevada Consolidated gives 21.68 as its cost in the third quarter, as against 18.07 and 16.85 in the second and first quarters respectively. These figures do not take into account any credits for the value of gold and silver recovered with the copper nor for any miscellaneous income. Comparisons are made with the costs in 1915, when they were 6.76 and 8.01 cents respectively for the Utah Copper and Nevada Consolidated, but the basis of comparison, we believe, is not quite the same.

ENGINEERING COUNCIL, through its committee of 15 representative engineers, expects to have ready for presentation at its December meeting the final draft of a proposed law requiring the licensing or registering of engineers. This will then be published in the various journals and transactions of the technical societies, so that those interested will have an opportunity to become familiar with its purport. A demand undoubtedly exists for some form of regulation of the practice of engineering, similar to that obtaining in other professions, whereby the public may be protected from the activities of charlatans, who, by signing reports and otherwise undertaking work for which they are not qualified, frequently bring disaster upon those who are guided by their incompetent advice. Whether this protection can be furnished in the manner contemplated by Engineering Council will not appear until the text of the proposed bill is known. We are told that eleven States have already enacted laws in an attempt to mitigate these evils, which indicates that the need for some regulation is becoming recognized throughout this country. The present effort of Engineering Council to knit together the diverse statutes into one Federal law seems, in its broad conception, to be carefully planned; if developed wisely in its details, so that it will not place emphasis upon a university education to the detriment of the highly competent empirical man, and if it receives the necessary cooperation of engineers, it should improve the standing of the profession and its usefulness to the community.

AFTER the Armistice, the surrender of the German fleet, and the sinking of the warships in Scapa Flow, comes the public washing of dirty linen. The heroic aspects of the German struggle for world dominance have been pitifully besmirched by these later performances. We are becoming weary of the 'confessions' of the German leaders, as they slowly find their way into our papers, but we read them nevertheless, for the sake of an occasional note of high interest. Ludendorff, Bethmann-Holweg, and Tirpitz have successively laid bare their awakening from dreams of easy conquest and glorious empire. On top of these memoirs comes the publication of secret dispatches proving, as was long ago inferred, that the Austrian note to Serbia and the invasion

of that country were done with the connivance and at the incitement of the gang at Potsdam. Ludendorff's account of the military phase of the struggle is so inaccurate, incomplete, and insincere as to have but little historic value, while his condemnation of the civilian morale and his criticisms of the policies of his own government indicate that his nerves could not stand the test and that he was just as bewildered as the rest of them when the great collapse came. We like Von Tirpitz best; he seems franker and manlier in his attitude to the events that culminated in the defeat of his hopes and plans. Too late he deplores the insanity that drove the white races into exterminating each other, although England and America appear to be excluded from his regret. He exposes the vanity of the Kaiser and the petty irritations that determined many of his actions. Above all, these German confessions exhibit an entire absence of sorrow for the sufferings brought on humanity by the War; instead, there are repeated expressions of chagrin that the great piratic scheme failed and a regretful rumination over the factors that made its success impracticable, with the suggestion that the next time there must be no such blunders. These German leaders are entirely unrepentant of their crime, the details of which they themselves have exposed. They justify the judgments formed in the early month of the War, on the basis of the information then available, and they show how, under an autocratic regime, a few men can play fast and loose with the fortunes of humanity.

Mr. Sulman and Flotation

From London we have received the November bulletin of the Institution of Mining and Metallurgy, in which we find a paper by Mr. H. Livingstone Sulman entitled 'A Contribution to the Study of Flotation'. It is a considerable contribution in bulk, for it occupies 95 pages. Mr. Sulman is known to our readers as one of the patentees identified with the Minerals Separation company, with which American mining engineers have been in unpleasant collision for the last five years. He is one of the most successful investigators of flotation phenomena, as his many patents testify, and he is an accomplished technician in this new branch of wet metallurgy; any paper by him will command the attention of the profession and will be read with something akin to eagerness. We have read this paper already and find much in it that is interesting, but it goes over ground familiar to our readers and appears to be written as if the author were unaware of the voluminous literature on the subject that has accumulated previously. We shall reproduce most, if not all, of Mr. Sulman's paper in our columns, because we believe that it is one that American mill-men will want to read for themselves, for the sake of the occasional items of information or suggestion that it may contain; but even before doing so we think it proper to record a strong protest against Mr. Sulman's unscholarly failure to make the customary references to previous writers on his subject. In the concluding paragraph of the paper he excuses himself for his lapse of good manners by presenting

a bouquet to his business associate, Mr. John Ballot, until recently the chairman of Minerals Separation Ltd. Mr. Sulman describes his partner as "one of the original inventors" of the process, when it is well known, on the evidence of Mr. Ballot himself, that he merely instructed a member of his staff, Mr. A. H. Higgins, to make a series of experiments, ringing the changes on various proportions of oil, rates of agitation, and so forth, the consequence being to confirm the results obtained a year before by Messrs. F. A. Beauchamp and Wilton Shellshear in the Central mill at Broken Hill—results of which Mr. Ballot must necessarily have been aware, because his own representative, Mr. G. A. Chapman, was on the spot and participating in the Australian experiments. Mr. Sulman says that "it is impossible to recount, far less to appreciate, the part which each [of the "numerous workers"] has played in overcoming the many difficulties which have surrounded the practical application of so radical a departure from previous concentration methods"; and then he points to Mr. Ballot as the one chiefly responsible, with "my [Mr. Sulman's] co-workers" in overcoming the aforesaid "many difficulties" in the way of a successful application of the process; as if the chief difficulty had not been the persistent efforts made by Messrs. Ballot, Sulman, and their associates to prevent the diffusion of knowledge concerning the process and the experimentation needed to ascertain the obscure physical principles on which it is based. If all of us had been docile, if all of us had been intimidated by the hectoring tactics of Messrs. Ballot, Sulman, and their associates, including their representative in San Francisco, there would have been precious little published on the technique of the flotation process during the 14 years that have elapsed since it was "invented" by Messrs. Ballot, Sulman, and Picard in London. Mr. Sulman proceeds to pay a tribute to the various valuable business qualities of Mr. Ballot by means of which, says Mr. Sulman, his partner "has succeeded in the firm establishment of a process of world-wide benefit to the mineral industry". How charitable and beneficent he and his friends have been is disclosed in the proceedings before the Federal Trade Commission as described by Mr. George L. Nye on other pages of this issue. The fact is that these gentlemen of the Minerals Separation company did all they could to delay the development of the process by others in order to obtain a monopolistic control of the business arising therefrom. As one of them told the present writer, they wished to check any further experimentation or writing on the subject until such time as they had a 'cinch' on the process by means of a Supreme Court decision. Mr. Ballot is not an inventor; he is the head of the patent-exploiting agency that has delayed the successful application of a process that might be "of world-wide benefit to the mineral industry". Although "invented" in 1905, it was not applied, for example, to the copper mines of the United States until 1915, because the metallurgists of the patent-owning corporation, namely, Minerals Separation Ltd., stated publicly that the process was unsuited to most copper sulphide ores, especially those containing chalcocite. Mr.

Ballot, Mr. Sulman, and their associates took pains—we repeat—to prevent the publication of technical information concerning the process, and Mr. Sulman now comes forward belatedly with a paper on the physics of flotation, traversing ground previously covered, in part at least, by others, without making any acknowledgment to them; he ignores all the preceding contributions to the technology of the subject, and has the effrontery instead to pay his compliments to the man chiefly responsible for delaying, harassing, and penalizing the development of flotation as a metallurgical method.

Taxation of Mines

Following upon the discussion of Mr. L. C. Graton's paper on the Federal taxation of mines, as recorded in our issue of October 11, it was arranged for a number of mining engineers to go into conference with the officials of the Treasury Department with a view to outlining the principles on which a fair and practicable system of taxation could be elaborated. This conference took place at Washington on October 7 and resulted in an agreement upon several points. In the first place, the committee of 33 mining engineers advised that mineral properties should be divided into two classes, one to include those in which the tonnage in reserve had been determined with reasonable accuracy and one to cover those in which no close estimate could be made. In the first class were included the disseminated copper deposits of the 'porphyry' type, the disseminated lead deposits, and those of iron ore, coal, and petroleum. A sub-committee on Class I advised a method that should begin by (1) determining the recoverable tonnage reasonably assured as of March 1, 1913, and available within a period not longer than 45 years. Then it would be necessary to ascertain (2) the average profit per ton to be expected during the life of the property, by subtracting the unit cost at point of delivery from the unit selling price. Next (3) the total recoverable profit for the life of the property should be determined by multiplying the figures obtained under (1) and (2). The life of the property should be fixed by dividing the total tonnage by the annual output, taking into consideration the probable increase or decrease in production. Finally, the present cash value of the full returnable profit should be determined on the basis of a 6% return on the capital. These recommendations were to be used as a basis for modifying the various Articles in Regulation 45. As to Class II, it was agreed that sole reliance cannot be placed on the ore developed at the date of valuation, but, in order to establish a reasonable estimate of the required factors, it is advisable to consider the habit and type of the orebodies in the mine, the characteristics of the district, the rate of development by exploration, the strength of mineralization, and the stage of its operating life that the mine has attained. It was the sense of the sub-committee that "in the estimate of value, reasonable extension outside developed orebodies shall be fixed in the valuation of the mine" and, the law permitting, further ore made available either by exploration or by improved processes of

treatment may be valued for the purposes of depletion.

We give this summary of the findings of the various committees in order to show in how large a measure the Treasury officials are accepting the assistance of the mining profession in their effort to base taxation upon logical principles. It is an excellent departure; for it will render taxation not only fairer but more intelligent, and therefore more effective. A mine is a risky venture and a wasting asset; these two facts underlie the business of mining and they should be recognized in any scheme of taxation. The dividend from a mine is not income until some allowance has been made for amortization of the capital involved. However, we will not go over the old ground again; we desire only to record the good spirit shown by the tax-collecting department, and we close by suggesting that this discussion of the fundamental principles of valuation with the tax-collector will react beneficially on the profession, and upon the technique of mine appraisal, by causing engineers to review their methods in the light of the criticism to which they may be subjected by those who know little about mines in particular but a good deal about valuation in general.

Mining and Speculation—III

In our issue of November 22 we discussed sundry ideas on mining finance as expressed recently in London. These are interesting to our readers, we believe, because, by implication, they bear upon American practice in such matters. For instance, the calculations of life made for the mines of the Rand by reputable engineers have been falsified again and again by the harsh logic of events because they were based upon the assumption of a uniformity that never existed. Mr. Gallard says that this assumption—or “theory”, as he calls it—“was exploded years ago”. It never was justified by the experience of mining in its world-wide sense, but sprang from the characteristic provincialism of those whose experience had been limited largely to the Rand itself, and to the complacency of those who knew better. In this matter, as in others, the profession played into the hands of the promoting houses, and they in turn found no difficulty in ‘persuading’ the London financial press. The manner in which estimates were accepted as bible-truth by the unsophisticated public is pathetic, and the way in which this gullibility was used by the financial groups in their successful campaign to unload over-valued mining stocks provokes sardonic laughter even at this late day. Mr. Gallard says truly that engineers’ reports now are more intelligible and more trustworthy than they used to be, but even now those that are given to the public are far from being the sincere statements they purport to be. When an engineer transmits his official report to a board of directors in London, or elsewhere, he usually accompanies it with a ‘heart to heart’ supplement in which he explains the salient paragraphs of the report and adds sundry information that he deems it wise to withhold for the directors themselves, ‘putting them wise’ as to one or two features that affect critically the life and produc-

tivity of the enterprise. The report as given to the public is not untrue, but it is only too often an incomplete statement, formal rather than informing concerning the real state of affairs. The idea still obtains—it used to reign supreme—that the shareholders cannot be trusted with the unvarnished facts; besides, the ‘insiders’, represented by the board, have the ‘right’ to know about the crucial developments before they are given to the public, which includes both present shareholders and those that will become shareholders in the near future by the purchase of shares—from the directors, for example. This refers mostly to bad news from the mine, but it covers also the contingency of discoveries that promise a rise in quotations. Again and again such news has been known to a select few for months before it was made public, by which time large blocks of stock have changed hands, to the advantage of the ‘insiders’. In some instances the engineer himself has been a party to the deal, for the directors are not unwilling to let him in with them, because, among other reasons, it makes him a *particeps criminis*. These practices have hurt the London mining market greatly, debauching the profession for the benefit of a lot of German Jews and other persons, some of whom won knighthoods and other honors by giving part of their loot to party funds or public charities. It may well be asked why did not the Institution of Mining and Metallurgy, which we regard as in many respects the best managed and most truly professional organization of English-speaking mining engineers, take steps to correct these evils and discipline its members? The answer is that the gradation from absolute chicanery to amiable irregularity is so gentle as to defy juridical distinctions. Moreover, most of the engineers serve also as directors and make a considerable part of their income from their fees as directors. Some of them engage in promotions. The inextricable complexity of the business and the interplay of genuine engineering with blatant promoting is so intricate as to frustrate any attempt to impose a code of conduct applicable to all cases. For instance, a consulting engineer binds himself not to buy shares before his report is delivered; the report is held up by the directors—one of them an engineer—while they buy sundry blocks of shares; whereupon the consulting engineer likewise, now deeming himself free to do so, enters into the gamble, which presumes that the issuance of the report to the public will cause a rapid rise in quotations. We are referring to an incident of which we have first-hand knowledge. It is typical. The engineer was not disciplined, although the facts were known to many. Who should throw the first stone? These conditions arise largely from the fact that a considerable number of the older engineers do not go into the field; they remain in London and send juniors to inspect the mines; they become directors of companies and drift inevitably into close relations with the promoters and financial groups, to whom mining is a game that is played with loaded dice: Whether the profession can ever free itself from these associations is a question that is not easy to answer, but it provokes regret.

Technical Operations on the Suan Concession, Korea -- IV

Flotation in Both Mills. Cyanidation. Tube-Milling.

By A. R. WEIGALL and J. F. MITCHELL-ROBERTS

FLOTATION. Although in the early days of this process, patents covering the Minerals Separation method were taken out in Japan, these had been allowed to lapse, and with the operation of the process in the Suan plant, no further patent in the Japanese empire is permissible. Consequently, flotation is practised in Japan without payment of any royalty. As almost every recognized form of flotation machine has been erected on the Suan Concession, and worked on an experimental scale, it seems unlikely that any flotation patent will ever become effective in Japan.

After flotation had been used successfully at both mills on the Concession, the process became widely applied in Japanese milling plants, and a large number of engineers have visited the Concession in order to see it. Several mining companies are now planning the erection of comparatively large flotation units and within the next few years there will be seen in Japan and Korea a marked advancement in the use of this method of concentrating low-grade ores.

The history of flotation on the Concession is interesting. In 1910, owing to the low copper extraction obtained by table concentration at the Suan mill, the possibilities of flotation were considered and samples of the ore were sent to Minerals Separation, Ltd., for testing. The report on these tests was that the ore was quite unsuitable for flotation. At this time flotation of copper ores had received comparatively small consideration, the principal application being to lead and zinc ores, and the possibilities of the successful application of the process to copper ores were not appreciated. Notwithstanding the first adverse reports, continued efforts were made, but without success, until finally the company's consulting engineer took a sample of the ore to Australia and had tests made there. These tests showed that not only was the ore amenable to flotation but that a high extraction was practicable. In the summer of 1913 a small flotation plant was erected at the Suan mill and operated with satisfactory results. Following this, plans were immediately drawn for the design of a permanent flotation plant to treat 250 tons per day. This plant was put into operation in the early part of 1914 and has been operated since then with marked success. It was one of the first successful flotation plants for the treatment of low-grade copper ores. In the same year the design of the Tul Mi Chung mill was completed, flotation being adopted as the chief means for saving the valuable minerals. This plant commenced operations in 1915.

From the experience gained in the Suan flotation plant,

several minor improvements were introduced in the Tul Mi Chung plant, and today this plant is one of the most successful of those treating low-grade copper ore, not only obtaining a high extraction but at the same time producing a very rich copper concentrate.

The treatment at the Suan mill has for its object the further recovery of copper minerals for the table-tailing, and in this plant flotation was an addition to a plant giving a low copper extraction, although the gold extraction, principally by amalgamation, was generally good. The ore contains finely divided copper minerals, but not so finely disseminated as in the Tul Mi Chung ore. The bismuth is saved largely on the tables, but still some bismuth is further recovered by flotation and by tabling the concentrate an additional amount can be recovered in the form of a high-grade bismuth-copper concentrate. Most of the bornite recovered by flotation is found to separate out with bismuth, whereas the chalcopryite in the flotation concentrate is left in the residual concentrate.

The chief flotation-oil used is eucalyptus, which, in spite of its nominally high cost, has proved to be the most economical oil to use, in association with a small amount of a heavier collecting oil. The use of a small amount of caustic lime at Suan has given beneficial results, whereas at Tul Mi Chung caustic soda is used. In all ores on the Concession the presence of a large proportion of limestone in the gangue precludes the use of an acid circuit, so all flotation circuits are either neutral or alkaline.

No improvement in recovery is obtained by the use of a hot circuit.

In an endeavor to obtain a cheaper substitute for eucalyptus oil, almost every known oil, and mixtures thereof, has been tried. Certain varieties of pine-oil give the next best results. Crude camphor-oils have shown some promise, but none can compare in economical efficiency with eucalyptus.

The average cost of oil is under 6 cents per ton of ore treated.

In the Suan mill the thickened pulp from the Callow cones and Kyloe thickeners goes to the flotation machines at an average dilution of 3:1.

The flotation plant comprises two machines of the Minerals Separation type. Both machines are of the kind described and illustrated in the description of the Tul Mi Chung mill. The nominal capacity of the Suan flotation plant is 250 tons per 24 hours.

The primary machine is composed of eight agitating-

boxes, each 32 in. square and 4 ft. 6 in. deep, and the secondary or re-cleaning machine similarly has eight agitating-boxes each 18 in. square by 3 ft. deep. The machines are driven by separate motors, that on the primary machine being a 60-hp. motor and on the secondary machine a 40-hp. The latter is double the capacity necessary, as the machine only actually consumes 15.7 hp. when working under normal load. This motor, however, also drives the return-pumps.

The bevel gears on these machines are made of phosphor-bronze, as described under Tul Mi Chung milling, and have given wonderfully good service. With the exception of the difference in size, the flotation machines vary but little from the design of those in the Tul Mi Chung mill.

The stirrers in the primary machine revolve at 285 r.p.m. and are of 21 in. diameter. The line-shaft driving this machine revolves at 300 r.p.m. Froth is removed from the spitz-boxes by the usual type of paddle, the radius of which is 6 in., revolving at 24 r.p.m. The stirrers in the secondary machine are 12 in. diam. revolving at 390 r.p.m., driven from a line-shaft revolving at 410 r.p.m.

The agitating-boxes were originally lined with old belting at the bottom and no lining at the tops. Now cast-iron linings are used in place of belting.

In operation, the froth from the first six spitz-boxes of the primary machine forms the feed of the secondary machine. The last spitz-box is overflowed fast and a good deal of pulp is allowed to run over with the froth, the overflow from the last box being returned to No. 1 agitating-box of the primary machine. In the secondary machine the overflow from the first four spitz-boxes is clean concentrate and the overflow from the last three boxes is returned to the first agitating-box of the secondary machine. In both machines the first agitating-box has no spitz, that is, there are eight agitating-boxes and seven spitz-boxes.

The following tabulation shows the average gold, silver, bismuth, and copper content of the various froths and products from the different boxes of the primary and secondary flotation machines at the Suan mill. The first agitating-box on each machine has no spitz-box.

| | Gold | Copper | Bismuth | Silver |
|----------------|-------|--------|---------|--------|
| Primary feed | 0.90 | 0.78 | ... | ... |
| " 1st box | ... | ... | ... | ... |
| " 2nd " | 24.00 | 21.63 | 1.77 | 5.08 |
| " 3rd " | 24.80 | 21.32 | 1.54 | 5.43 |
| " 4th " | 32.80 | 19.34 | 2.35 | 6.32 |
| " 5th " | 12.60 | 18.24 | 1.87 | 2.40 |
| " 6th " | 13.80 | 15.98 | 1.95 | 2.80 |
| " 7th " | 11.60 | 19.08 | 1.54 | 2.40 |
| " 8th " | 1.80 | 0.66 | 1.18 | 0.24 |
| " tailing | ... | ... | ... | ... |
| Secondary feed | 19.00 | 20.60 | ... | ... |
| " 1st box | ... | ... | ... | ... |
| " 2nd " | 26.00 | 30.77 | 1.99 | 4.80 |
| " 3rd " | 25.60 | 30.32 | 2.24 | 5.72 |
| " 4th " | 27.00 | 27.65 | 2.01 | 5.46 |
| " 5th " | 25.60 | 29.61 | 2.14 | 5.20 |
| " 6th " | 11.78 | 6.78 | 0.69 | 2.16 |
| " 7th " | 6.00 | 3.71 | 0.48 | 1.23 |
| " 8th " | 6.80 | 3.50 | 0.42 | 1.06 |
| " tailing | 5.50 | 3.20 | ... | ... |

Note: Daily assays for the small amount of bismuth and silver in the tailing are not made.

Formerly the practice was to disregard the small percentage of bismuth in the clean flotation froth, which was

run into settling-tanks from which it was trammed to the drying-house and sold on a gold-silver-copper basis. The present practice is to pump the clean flotation froth to a Card table, where a large proportion of the bismuth is separated out. The tailing from the operation, containing the bulk of the gold, silver, and copper, is then sent back to the settling-tank and sent on to the drying-house. No difficulty has been experienced in the elevation and re-tabling of the flotation froth and breaking it down for the table.

The reagents used in the primary machine are 0.2 lb. of eucalyptus oil per ton of ore milled, fed to No. 1 agitating-box by a small pump with a $\frac{3}{8}$ -in. plunger. Thin coal-tar is fed to the tube-mill by a Smith feeder, the average amount being 0.25 lb. per ton of ore milled. About 2½ lb. lime per ton of ore milled is added to the Dorr classifier, the object being to maintain the alkalinity of the pulp at about 0.02 lb. CaO per ton of solution. A mixture of equal parts of brown camphor oil and thin coal-tar is added at No. 5 box of the primary machine, the amount added being from 0.04 to 0.06 lb. per ton of ore milled.

The time required for pulp to pass through the primary machine varies from 18 to 25 minutes. The volume of the agitating-boxes in this machine is 160 cubic feet and of the spitz-boxes 180 cu. ft. Crowding-boards are used to restrict the area of the surface of the last three spitz-boxes of the primary machine and maintain the thickness of the froth.

The reagents used in the secondary machine are 0.275 lb. of eucalyptus per ton of primary froth treated, added at the first mixing-box, and lime-water containing 3 to 4 lb. CaO per ton of primary froth, added to the same mixing-box. The alkalinity of the water in the pulp is maintained at 0.01 to 0.015 lb. CaO per ton of solution. The volume of the agitating-boxes in the secondary machine is 32 cu. ft. and of the spitz-boxes 48 cu. ft. The time required for pulp to pass through the secondary machine varies from 18 to 30 minutes.

The tailing from the secondary machine is elevated to a Callow settling-cone by a 2-in. centrifugal pump, which lifts the pulp 18 ft. The underflow from this cone returns to the first box of the primary machine. The overflow, which is trapped, is clear water. Thus the secondary machine is in closed circuit with the primary machine. The tailing from the primary machine goes to a two-compartment cascade froth-trap; the froth from this trap is added to the clean froth from the secondary machine and re-cleaned on a Card table for the separation of bismuth.

The average grade of the clean flotation froth is as follows:

| | | |
|---------|--------|--------------|
| Gold | 25 | dwt. per ton |
| Silver | 4.6 | oz. per ton |
| Copper | 27.65% | |
| Bismuth | 1.8% | |

CYANIDATION. Although cyanidation has never been considered seriously in connection with the treatment of the ore of the Suan mine, owing to the relatively low grade of the mill-tailing, still several tests were carried

FIG. 1. SUAN FROTH-TRAP

FIG. 2. FLOTATION MACHINE USED IN THE MILLS OF THE SUAN CONCESSION

out, these tending to show that subsequent cyanidation of the tailing would not result in a profit, and the matter has therefore been dropped.

On the other hand, at the Tul Mi Chung mill, the initial tests that were made on the ore previous to the designing of the present mill anticipated cyanidation as an alternative to amalgamation. At this period the arsenical content of the ore was lower than it is today and amalgamation appeared to be the more promising process, notwithstanding the fact that in the tests after amalgamation and subsequent flotation there remained in the tailing over 2 dwt. of gold; it was with a view to the recovery of this residual gold that cyanidation was proposed. Subsequent tests showed that flotation followed by cyanidation of the tailing gave a higher extraction than amalgamation and flotation. However, as previously mentioned, in the original arrangement of the Tul Mi Chung mill, amalgamation plates were provided ahead of the flotation section. When it was found that the amalgamation extraction did not compare in practice with the results obtained in the original tests, further cyanidation tests were made at Denver early in 1916.

At this time the arsenical content of the ore had appreciably increased and it had been found that the arsenical minerals (arsenopyrite and lollingite) carried a considerable amount of the gold that was not being recovered by flotation; further, that it was the finest grained arsenical minerals that contained the greatest amount of gold, and these minerals were disseminated throughout the ore. Owing to the fact that the copper content of the first Tul Mi Chung samples was above that of the average of the mill-tailing, the cyanide consumption was high and the extraction of the gold normally low.

As a result of these tests it was decided to endeavor to improve the extraction of the copper by flotation, and to remove as much of the arsenical minerals as possible by the use of tables after flotation. Following the addition of the tables to the mill and the use of caustic soda as an additional reagent in the flotation section, the copper recovery improved and the copper content of the residual tailing was diminished. The operation of the tables improved the gold extraction about 4 to 5%, which was still low, so further tests were made at Denver and at San Francisco on the new tailing. The results showed that there was the possibility of increasing the total gold recovery to about 85 to 90% with a cyanide consumption of approximately 2.5 lb. per ton of tailing.

Before proceeding with the design of a large cyanide plant on the basis of the results and treatment of the later tests, it was deemed prudent to carry out further large-scale tests at the mill on current mill-tailing in order to establish the best method of procedure. At this time the average grade of the tailing was \$2.50 per ton in gold value. For this purpose a complete 10-ton per day pilot testing-plant was added, in which tests could be continually carried out, and the relative merits of counter-current decantation and thickening followed by filtration could be determined.

The testing-plant was provided with the following equipment:

One 15 by 10-ft. Dorr thickener.

One 8 by 8-ft. Oliver filter.

Four 8 by 8-ft. Dorr agitators.

Four 10 by 10-ft. Dorr thickeners.

One 8 by 8-ft. Oliver filter.

One Merrill zinc-dust precipitation press, diaphragm pump, etc.

The preliminary tests that had been made had shown that a change of solution during agitation would be beneficial; accordingly, in the general arrangement of the pilot testing-plant, one of the thickeners was placed between the agitators.

The plant was operated for four months with counter-current decantation and two months with thickening and final filtering. The mechanical cyanide loss was in favor of final filtering, but the extra cost of the power necessary more than offset the saving.

Although the agitator capacity was sufficient to have given 32 hours treatment, it was soon found that an 8-hour agitation was sufficiently long, and only a very small increase was obtained by prolonging the agitation beyond this time.

There exists naturally in the ore a light slime that cannot be readily coagulated and settled, and numerous tests were carried out on the primary thickener-overflow to determine the value and amount of this non-settling slime. It was found to contain regularly 1.35 dwt. of gold per ton and to amount to practically 10% of the general mill-tailing. Further tests carried out on the overflow from the tailing-dam confirmed these tests. Apart from this slime, the remainder of the tailing is extremely free-settling, owing, no doubt, to the generally high specific gravity of the ore, which is seldom less than 3.1.

In the agitators rapid segregation of the fine and coarse sands took place, there being only approximately 9% of sand coarser than 100-mesh in the tailing during agitation. This behavior of the tailing persisted even at a dilution of 1:1 and was the cause of frequent shut-downs; it led to a series of straight-percolation leaching experiments being started.

The results of these small-scale percolation tests were so encouraging, that on the completion of the counter-current decantation and filtration tests, two of the agitators were fitted with filter-bottoms and percolation experiments were made on 10-ton lots of deslimed tailing. The continuous agitation results gave a 60 to 70% extraction with a chemical cyanide consumption of 1.6 to 1.8 lb. of cyanide on an 8-hour agitation period. The same results were obtained by straight percolation on a 4½-ft. bed of sand with a 72-hour percolation period. Throughout the tests a 3-lb. cyanide solution was used, this having been determined by preliminary experiments to yield the best results. Occasionally a 5-lb. solution was used, without obtaining better extraction results but increasing the cyanide consumption. If the solutions contained less than 0.6 lb. of cyanide, re-precipitation of

the gold took place and the arsenic began to interfere with, and foul, the solutions.

On account of the large amount of limestone present in the gangue, preliminary roasting followed by an acid leach is impracticable. The tests have shown that up to 0.09% of copper in the tailing no deleterious effects are experienced; above that percentage, however, there is a fairly rapid increase in the cyanide consumption.

In consequence of these tests, it was decided that a percolation plant is best suited to the treatment of the tailing and a 600-ton per day capacity plant has been designed; this will be erected as soon as conditions will allow of the delivery of the necessary equipment.

The plant will consist in the main of the following:

Three collecting-vats 50 by 15 ft.

Ten leaching-vats 50 by 6 ft.

One Blaisdell sand-distributor, with the necessary belt-conveyors from the collecting-vats.

Three solution-vats 50 by 15 ft.

Merrill precipitation presses, pumps, etc.

Hand-shoveling will be employed for emptying both the collecting and leaching-vats. The final residue will be discharged into cars and trammed by hand to the dump. As designed, the plant will require approximately 100 hp. to operate.

With a view to ascertaining whether or not a low-grade concentrate could be produced and subsequently cyanided, numerous tests were carried out; but, owing to the high cyanide consumption, all were dismissed in favor of straight percolation of the tailing.

The sand is most difficult to handle by any system of mechanical, air, or hydraulic agitation; in a two-minute period it sets so hard as to require digging, even when the bed is only 8 to 12 inches deep. It would seem that desliming by the removal of the non-settling slime robs the tailing of its natural lubricant and is the primary cause of this difficulty.

MILLING AT SUAN. The Suan mill was the first plant built on the Concession. It was erected during 1909 and was in operation by December of that year. It consisted of a 20-stamp mill with the necessary crushing, amalgamating, and wet concentrating machinery. This mill was increased by an additional 20 stamps, etc., and the whole 40-stamp mill was in operation in 1910. Amalgamation and table-concentration were adopted for the recovery of the gold and copper in the ore. The capacity of the mill is about 250 tons per 24 hours.

The ore of the Suan mine consists of a highly silicious magnesian limestone much altered by metamorphism. The typical contact minerals occur plentifully in the gangue, especially garnet and tremolite, the former of which increases the hardness and toughness of the ore, while the latter is detrimental on account of its tendency to choke the battery-screens and reduce the stamp-duty. In addition to gold and silver, the ore contains copper and bismuth. Visible gold is not common, but coarse gold occasionally occurs. It is alloyed with silver, the ratio roughly being 4.6 of gold to 1 of silver. The copper is present mostly as chalcopyrite, less commonly as

bornite, and rarely as tetrahedrite. A high percentage of copper is usually associated with a high gold content and, though there is no fixed ratio, we find roughly that each one-tenth of a percentage of copper in the ore corresponds to about one pennyweight of gold per ton, that is, an ore with 1% of copper generally contains about 10 dwt. gold per ton. Bismuth occurs as bismuthine, and, as a general rule, the amount of bismuth in the ore appears to vary as the gold and copper in the ore.

The ore minerals are in a fine state of division necessitating fine grinding, although in this respect the fineness of the mineral in the Suan ore is not comparable to the abnormal fineness of the ore minerals in the Tul Mi Chung ore.

The composition of the ore varies so greatly in different parts of the mine that it is difficult to obtain truly representative analyses. Probably the most typical analysis was one of a composite sample made up of equal parts from some 1500 samples taken in the course of a check-sampling of the ore-reserve in the mine in 1913, when stoping was being done on every level. This composite sample had the following composition:

| | % | | % |
|-----------------------------|-------|-----------------------|-----------------|
| Silicious insoluble residue | 73.70 | Magnesia | 10.15 |
| Bismuth | 0.075 | Sulphur | 1.60 |
| Iron | 2.70 | Phosphoric acid | 0.02 |
| Copper | 0.92 | Carbonic acid | 2.92 |
| Arsenic | trace | Undetermined and loss | 1.935 |
| Alumina | 1.98 | Gold | .8 dwt. per ton |
| Lime | 4.00 | Silver | 0.6 oz. per ton |

As a rule, however, analyses showed a higher percentage of lime and magnesia than is indicated in the above analysis.

Although the ore is extremely tough and generally hard, it is not abrasive.

POWER.—The Suan mill, as originally built, was steam-driven, power being supplied by a 15 by 22 by 16-in. compound tandem Ideal engine of 250 hp., 180 r.p.m., supplied with steam from Stirling water-tube boilers of 100 hp. each, working under a steam pressure of 150 pounds. The boilers were fired with cordwood burnt on specially designed grates. The concentrating tables were driven by a 15-hp. Brownhill engine, and an independent lighting circuit was provided for by a 17.5 kw. generator driven by a 40-hp. Ohman engine.

The mill was driven by steam power until the beginning of 1914, when electric power became available from the company's power plant at Pyeng Yang, some 55 miles away from the Concession. Independent motor-drives were put in and the plant thereafter operated by electricity.

The power required to operate the Suan mill averages 5571 kw. per 24 hours, equivalent to 20.767 kw-hours per ton of ore milled.

| Section | Kw-hours per ton of ore milled |
|--------------------------|--------------------------------|
| Crushing | 1.112 |
| Stamp-milling | 7.559 |
| Tube-mill and classifier | 4.878 |
| Concentrating tables | 0.081 |
| Flotation | 6.537 |
| Total | 20.767 |

These figures represent the average of operations during one year, namely, 1917.

(To be Continued)

A Drill-Round Model

By WALTER S. WEEKS

Mining companies are becoming alive to the fact that there is usually a best way of doing a given piece of routine work, and they find it advisable therefore to instruct their men.

The placing of drill-holes for rounds in a drift is an

FIG. 1. FRONT VIEW OF MODEL

operation that lends itself admirably to standardization. The visualization of a drill-round in three dimensions is often difficult for a miner, so I am describing a simple

FIG. 2. SIDE VIEW OF MODEL

working-model which has proved its usefulness in the Mining Department in the University of California.

The photographs are almost self-explanatory. Two frames are constructed, as shown. The one nearer the machine represents the breast of the drift and the other represents the limit of the advance. The advance can be made any distance desired by moving the rear frame. These frames are covered with chicken-wire. The drill-

holes are represented by rods of wood that can be rested in any position on the wire. They are held in place by the collar shown in Fig. 3.

Suppose we wish to represent a downward hole. The

FIG. 3. THE COLLAR

collar is slipped over the rod. A small nail is put in the hole A. The collar rests against the wire and prevents the rod from sliding through.

Suppose we have an upward hole. The nail is placed in B. The hook is hooked in the wire and the rod is thus kept from sliding back.

These collars represent the actual collars of the drill-holes. Obviously any type of round can be illustrated.

GRAPHITE occurs in nature in two forms, crystalline and amorphous, and each form has its own peculiar uses. The term crystalline or flake graphite is commonly understood to mean graphite in crystals large enough to be visible to the naked eye; much of the graphite called amorphous in the trade shows a crystalline structure under the microscope. Amorphous graphite may occur wherever coal or other carbonaceous beds have been altered through the influence of neighboring bodies of igneous rock or of movements within the earth's crust. Graphite is also manufactured, chiefly by the Acheson Graphite Co., which utilizes power generated at Niagara Falls. The output has increased greatly in recent years and now forms an important element in the country's supply of graphite. The bulk graphite is made either from anthracite or from petroleum coke and is utilized mainly in lubricants but also for paints, foundry facings, boiler-scale preventives, and battery fillers. A high degree of purity is claimed for the lubricating graphite manufactured in this manner. In 1918 the Acheson Graphite Co. manufactured 9,182,272 lb. of graphite. The shipments of crystalline graphite in 1918 amounted to the record-breaking figures of 12,861,839 lb., valued at \$1,454,799, according to the U. S. Geological Survey. As mine stocks were approximately the same at the beginning and end of the year, this represents about the mine production. The sales showed an increase of 22% by weight and 33% by value over those for 1917. The sales of domestic amorphous graphite during 1918 amounted to 6560 short tons, valued at \$69,455, compared with 8301 tons, valued at \$73,481, in 1917, and 2622 tons, valued at \$20,723, in 1916. The increased use of graphite in foundry facings has absorbed the increased output in this country as well as much imported amorphous graphite, chiefly from Mexico.

Minerals Separation v. Mining Industry

By GEORGE L. NYE

*THE HISTORY of the discovery of the peculiar affinity of oil for metal, as distinguished from gangue, in the mass of ore is so much a matter of every-day knowledge that it would be like "carrying coals to Newcastle" for me to undertake to repeat it to those who are probably more familiar with it than I.

The history of Minerals Separation Ltd. is quite a different matter, even more interesting and not by any means so well known. I shall refer to some of it for your enlightenment and, I trust, to your advantage.

Minerals Separation Ltd. was organized under the British Companies Act in December 1903, and its charter is sufficiently broad to permit it to do practically everything under the shining sun except practice medicine or preach the gospel, but it soon became manifest that it was intended for a particular line of endeavor, and its paths since then, although devious, have been well defined, and its trail on the heels of the mining industry, which it has stalked from the beginning of its career, is well marked and unbroken.

In August 1910, Minerals Separation Ltd. caused Minerals Separation American Syndicate to be organized to acquire a two-year option on certain patent-rights for the United States, Canada, and North America, the Caribbean Sea countries generally, including Mexico and Cuba. A month later, this concern and Minerals Separation Ltd., the parent company, entered into an agreement to organize a third company to purchase these patent-rights. This company was actually organized as Minerals Separation American Syndicate 1913, and did later acquire and exploit these patent-rights.

Immediately after the organization of Minerals Separation Ltd., as disclosed by the records, Kindersley & Pusch, understood at that time to have been agents of the German metal trust, became large and prominent stockholders.

Albert Sondheimer, of Beer, Sondheimer & Co., which in 1910 controlled the principal zinc and lead markets of the world, was one of the original directors of Minerals Separation American Syndicate, and in the third or purchasing company Nathan Sondheimer was a director and Emil Beer an alternate director. In this third company, Kindersley & Pusch were the largest and Beer, Sondheimer & Co. the second largest stockholders.

How did these German interests get this control of English companies? Probably because the first considerable development and use of flotation was in connection with the lead and zinc mines of Australia, where, at the

time, the entire output was absolutely controlled by Beer, Sondheimer & Co.

The history of the struggle of Australia to throw off the yoke, and the years of resultant litigation, which only ended with drastic legislation forbidding any but British subjects to deal in lead and zinc, would make a chapter by itself, for which there is no room here.

In June 1913, Minerals Separation American Syndicate 1913 was incorporated, and in the following September it made an agreement with Beer, Sondheimer & Co. appointing the latter sole agents in the United States for all the patent-rights of Minerals Separation American Syndicate 1913. We might pause here to remark that the first suit in the United States (Minerals Separation v. Hyde) was brought in 1911 and alleged ownership in Minerals Separation, notwithstanding the option held by Minerals Separation American Syndicate and the contract of 1910 to organize a corporation to acquire title to the patents in America.

Beer, Sondheimer & Co. operated as sole agents of Minerals Separation in the United States at least until the outbreak of the European war, and probably for quite a time thereafter. During the War, the existence of the contract undoubtedly caused grave concern to Minerals Separation, and many efforts were made to avoid violating the British 'Trading with the Enemy Act', but through an unwillingness of the American representatives of Beer, Sondheimer & Co. and the hesitation of Minerals Separation to take advantage of the termination of the Beer, Sondheimer & Co. contract, by the declaration of war between England and Germany, only such changes as were absolutely necessary to screen the real situation were made. Not until November 1916 were the internal agonies of this German-controlled British concern for the three preceding years made known, by the filing, at Somerset House, of a contract dated August 4, 1916, between Minerals Separation American Syndicate 1913, first party, John Ballot as purchasing trustee, second party, and Benno Elkan and Otto Frohnknecht, described as doing business as Beer, Sondheimer & Co., American Branch, third parties and beneficiaries.

The agreement recites the ownership by Minerals Separation American Syndicate 1913 of the patent-rights already mentioned, the contract appointing Beer, Sondheimer & Co. sole agents for America on a commission basis, and then follows a recital that "by instrument of declaration and guarantee executed by the agents", that is, by Elkan and Frohnknecht, on October 5, 1914, it was declared that the original agency contract had been performed on the part of Beer, Sondheimer & Co. exclusively by Elkan and Frohnknecht and that the only benefits that

*An address delivered by the Special Counsel for the American Mining Congress, in the Federal Trade Commission enquiry, at the St. Louis convention.

had arisen to Beer, Sondheimer & Co. of Frankfort, or Beer, Sondheimer & Co., American Branch, had been commissions on royalties paid over to Minerals Separation American Syndicate 1913; that deduction of such commissions had been discontinued prior to the War and had not been resumed; that in order to eliminate all questions as to enemy character of Elkan and Frohnknecht and for the purpose of allowing Minerals Separation American Syndicate 1913 to continue trade relations with them, they undertook that they would not pay, directly or indirectly, anything of value arising from their connection with Minerals Separation American Syndicate 1913 to Beer, Sondheimer & Co., and would not deduct any commissions in any event until after the close of the War, and that trade relations between Minerals Separation American Syndicate 1913 and Elkan and Frohnknecht should be to the entire exclusion of Beer, Sondheimer & Co.

The agreement goes on to recite that subsequent to the delivery of the alleged instrument of declaration and guaranty, the original agency-contract was superseded by a contract entered into between Minerals Separation American Syndicate 1913 and Elkan and Frohnknecht on January 6, 1915, in which Elkan and Frohnknecht were appointed sole agents of Minerals Separation American Syndicate 1913 in America and the Philippine Islands, for the purpose of exploiting the patents.

It is worthy of note that the alleged agreement of January 6, 1915, did not appear of record at Somerset House in November 1916, at the time the contract of August 4, 1916, was filed; in fact, so far as our present information goes, it has never appeared on the public records. In April 1915, during the progress of the trial of Minerals Separation against Miami Copper Co., in the U. S. District Court in Delaware, for alleged infringement of plaintiff's process patents, plaintiff, on April 5th, put on the stand one Harry Falck, who testified:

"I reside in New York and am general office manager of Beer, Sondheimer & Co."

When asked, "Beer, Sondheimer & Co. stand in what relation to Minerals Separation Ltd. or Minerals Separation American Syndicate 1913 Ltd?" Mr. Falck replied, "They are agents for the Minerals Separation American Syndicate 1913 Ltd. for North America, Cuba, including the West Indies." When asked if "it is a part of your duty, as office manager for Beer, Sondheimer & Co., to be familiar with the granting of licenses and the payment of royalties under licenses in regard to Minerals Separation Ltd. patents?" Mr. Falck replied, "Yes, sir."

Mr. Falck then testified that the books of original entry of Beer, Sondheimer & Co. were prepared under his supervision and checked by him. When asked if "in the ordinary course of business the check comes in to Beer, Sondheimer & Co.?" Mr. Falck replied, "Yes, mostly."

Q. "If not, the payment is noted by Beer, Sondheimer & Co.?" A. "Yes, that is it."

Bearing in mind that all these questions were asked by counsel for Minerals Separation Ltd., it is plain that the witness intended to state that as late as April 5, 1915,

Beer, Sondheimer & Co. were in fact acting as agents for Minerals Separation Ltd. and Minerals Separation American Syndicate 1913 Ltd., and an exhibit which he put in evidence, prepared by him, entitled 'Statements of Accounts of Royalties of Minerals Separation Ltd.' shows payments collected by Beer, Sondheimer & Co. as late as March 8, 1915, and amounting to thousands of dollars.

In view of this testimony, it would seem to be a matter of some question whether recitals in the agreement of August 4, 1916, to the effect that the relationship with Beer, Sondheimer & Co. had terminated in 1914, were entirely correct.

The naturalization records in New York show that Otto Frohnknecht was born in Frankfort, came to the United States June 10, 1906, and had continuously resided in the United States up to the time that he made his first declaration of intention to become an American citizen, on August 4, 1914, the very day of the declaration of war between Great Britain and Germany. He was admitted to citizenship on February 6, 1917. The same records show that Benno Elkan was born in Frankfort, came to New York June 7, 1906, made his first declaration February 11, 1915, and was admitted to citizenship on May 22, 1917.

The records in the office of the Secretary of State of New York show that August 26, 1915, a company was incorporated, under the corporate title of Beer, Sondheimer & Co., Inc., with its principal place of business in New York City, with Benno Elkan, Otto Frohnknecht, Harry Falck, James A. Nelson, and William A. Cooper as its directors for the first year. Elkan was president, Frohnknecht vice-president, and Nelson secretary. The name of this corporation is nowhere mentioned in any of the agreements with Minerals Separation and its various subsidiaries, and no records concerning it appear at Somerset House. It is quite conceivable that one of the purposes of the American corporation, Beer, Sondheimer & Co., Inc., was to enable Minerals Separation Ltd. and its subsidiaries in America to give the technical appearance of truth to their statements that they were in no manner connected with Beer, Sondheimer & Co., meaning the American corporation instead of the German copartnership, relying upon the fact that connection with the German concern was indirect and by representation, rather than by a direct connection.

The British black-list, which was published in July 1916, included Beer, Sondheimer & Co., and the subsequent declarations of British officials indicate the intention of the British government to reach the American end as well as the parent institution, but the absence of any record in England of the organization of Beer, Sondheimer & Co., Inc., the American corporation, left a loophole for continued technical denials, with some semblance of truth.

The agreement between Minerals Separation American Syndicate 1913 and Ballot, as purchasing agent for Elkan and Frohnknecht already referred to, provided that Ballot should cause a Delaware corporation to be organized, with shares without par value, to acquire all of the

property of Minerals Separation American Syndicate 1913, and issue part of its stock therefor. The agreement further provided that the alleged agency agreement of January 6, 1915, should be amended so as to relieve Minerals Separation American Syndicate 1913 and also the proposed Delaware company from the payment of commissions, and that in consideration thereof, certain shares of stock should be issued to Elkan and Frohnknecht and exchanged for voting certificates for a period of five years. Of course, this manifestly was intended to carry the whole thing over until after the conclusion of the European war, and thus relieve many embarrassing situations. As matter of fact, as it later developed in parliamentary debates in England, this contract was subsequently modified to possess a duration coterminous with the War.

The proposed new corporation, which was given the name of Minerals Separation North American Corporation, was actually organized in December 1916, but under the laws of Maryland, instead of Delaware. On March 16, 1917, Minerals Separation American Syndicate 1913 was wound up by appropriate proceedings in England, where it was incorporated.

It has been constantly asserted by Minerals Separation and by the North American corporation that Beer, Sondheimer & Co. no longer, directly or indirectly, control or act as agents for Minerals Separation Ltd. or any of its subsidiaries, but as to the date when such agency terminated, there seems to be no unanimity among the various statements. If the recitals in the agreement of August 4, 1916, between Minerals Separation American Syndicate 1913 and John Ballot are to be believed, that relationship terminated in October 1914, yet according to these same recitals, Minerals Separation American Syndicate in January 1915, appointed Elkan and Frohnknecht its agents, and on April 5, 1915, Harry Falck testified that Beer, Sondheimer & Co. were still collecting royalties and presumably paying themselves commissions. Another rather striking feature is that as late as January 1917, Minerals Separation North American Corporation had on its letterhead the statement that Beer, Sondheimer & Co., 61 Broadway, were its general agents.

Possibly these matters of history, thus briefly recited, are of no particular concern, in view of what we may designate the technical legal position at the present time under the patents, but nevertheless history is usually interesting, oftentimes enlightening, and frequently of benefit in the matter of present negotiation and future relationship.

PRESENT PREDICAMENT. The American patent now known as "Fraction of 1% oil", No. 835,120, was granted to Sulman, Picard, and Ballot on November 6, 1906. Patent No. 962,678 (soluble frothing-agents) was granted to Sulman, Greenway, and Higgins on June 26, 1910. A third, No. 1,099,699, was granted on June 9, 1914, to H. H. Greenway (phenol or cresol cold without acid). All now belong to Minerals Separation North American Corporation, and they are the only patents out of the 53 varieties claimed by them which have been litigated.

It is now definitely settled by the case of Minerals Separation v. Butte & Superior, 250 U. S. 336, decided by the Supreme Court of the United States on June 2, 1919, that the use of less than 1% of oil on the ore infringes patent No. 835,120, and that the use of more than 1% of oil on the ore does not infringe that patent.

The license-agreement which has been in use for some time by Minerals Separation North American Corporation is in many respects a most remarkable document.

Paragraph 1 contains a blank for a description of the royalties to be paid, and, according to the best information obtainable, this blank has been variously filled to suit the situation in respect to the particular licensee.

Paragraph 2 requires the licensee to keep records of all concentration operations, whether by flotation under Minerals Separation process or by flotation under rival processes, or by older forms of concentration, such as hand-sorting or gravity concentration by the use of jigs, vanners, tables, and cyanidation. In many instances, royalties are exacted from licensees not only on the concentrates resulting from the use of Minerals Separation processes, but also on all concentration resulting from any process, whether covered by Minerals Separation patents or not, presumably upon the theory that if the Minerals Separation patent is used at all in the general process of concentration, the whole recovery should pay tribute to those who control what they are pleased to regard as an essential element of the whole process.

Paragraph 3 requires that the licensee, during the continuation of the license shall "promptly communicate and explain to the licensors every invention or discovery made or used by them which may be an improvement, modification, or addition to any of the inventions *specified in the letters patent*. It further provides that all such inventions and discoveries become the property of Minerals Separation, leaving the licensee who has invented the same only shop-rights for the use of his invention, and that Minerals Separation thereafter may grant licenses thereon and derive a profit therefrom.

This clause, of course, was intended to and does give to Minerals Separation a complete control of all future development in the art of flotation. Not only does it include every new process, but it includes also apparatus, so that the whole field is brought within the complete domination of Minerals Separation. This paragraph also requires the licensee to bind its employees to assign and transfer to Minerals Separation any invention made by them during their employment. Thus the control of Minerals Separation is extended over future inventions in the art of flotation beyond inventions made by the licensee, and includes all inventions made by employees.

The paragraph further provides that the licensee shall not, without the written consent of the licensor, during the *continuance of the license*, use or employ any improvement, modification, or addition to any of the inventions *specified in the letters patent* "within this license", which improvement, modification, or addition is not the property of the licensor.

When we consider that Minerals Separation is in a

position to claim that any invention in any branch of the art of flotation is in some way an improvement, modification, or addition of its own inventions, it is perfectly obvious that the purpose and result of this clause is to require the licensee to obtain permission from Minerals Separation before it can use any improvement in the art which the future may bring.

Paragraph 4 provides that the licensor shall give assistance, information, and advice to licensee whenever required, upon licensee paying out-of-pocket expenses.

Paragraph 5 provides that licensee shall not, directly or indirectly, during the license period or thereafter, dispute or object to the validity of the letters patent within the license or the novelty or utility of the inventions specified therein.

Paragraph 6 clinches the contract by forbidding the licensee to use any licensed inventions otherwise than in accordance with the agreement. It further forbids the licensee assisting any hostile party in litigation against Minerals Separation and from appearing in court or giving to the court the results of his own observation, use, or experience.

Paragraph 7 forbids the licensee to sell or dispose of any machinery or apparatus, the subject-matter of any of said letters patent, unless sold to a responsible party who will, in turn, agree to take a license from Minerals Separation Ltd.

Paragraph 8 gives licensor the right of inspection and examination.

Paragraph 9 provides that the licensee shall not, without the written consent of licensor, communicate any details connected with the working of any of said inventions, modifications, additions, or improvements to any third party. This again emphasizes the restraint imposed by Minerals Separation upon any dissemination of information except under its direction or control. This restraint upon the spread of knowledge is not only adverse to the public interests, but is certainly against public policy.

Paragraph 10 of the license-agreement provides that the licensor, when required by the licensee "shall prepare and supply, as soon as may be possible, plans and specifications of the plant for the working of said invention". This paragraph must be read in connection with the previous paragraph which, in effect, forbids the licensee to use any apparatus except that specified by the licensor, and read in this connection, it simply makes more definite and positive the restraint imposed by the previous paragraph.

When we come to the question of royalties, we reach a most interesting field. T. J. Hoover, one-time manager for Minerals Separation, and who resigned his position in 1910, published a book in 1912, entitled 'Concentration of Ore by Flotation'. In this book, on page 163, he says:

"The average royalty charged by the process owners for the use of these flotation processes (referring to Minerals Separation Ltd.) is one shilling (25c.) per ton of ore treated. This is a very high royalty as measured by others with which miners and metallurgists are familiar.

It is conceded that the inventor deserves compensation for his ingenuity, but one shilling per ton is about four times as large a royalty as the mine manager would expect."

In this connection, it perhaps is well to note that when the plan of Minerals Separation to charge royalties upon all values recovered by concentration, when flotation was used as any part of the process, was vigorously combated and contended against by applicants for licenses as unreasonable, unfair, and unjust, and when absolutely driven from its position by the logical force of the arguments against such an arrangement, Minerals Separation very gallantly came to the front and announced that it was going to change its policy in respect to royalties and was going to offer to applicants for a license an opportunity to make a selection and to determine for themselves whether they would pay a license charge upon the whole recovery or a license charge upon that portion recovered by the flotation process alone. This offer seemed to afford some means of at least partial relief, until a careful analysis was made of the different bases for royalty computation in the suggested new contract. This computation quickly demonstrated that whichever plan the licensee chose, the charge was practically the same; in other words, Minerals Separation caught them going and caught them coming.

To make a concrete illustration, let us suppose that in the whole concentration process of a particular licensee, four tons of ore are treated, from which ore old-fashioned and well-known processes extract four-fifths of the recoverable value and oil-flotation one-fifth. Under the original plan of royalty payment, the licensee would be paying 25c. per ton of ore treated, or \$1. Under the new plan, the licensee would be paying only upon the amount of metallic value recovered by oil-flotation, but instead of paying one-fifth of the original charge, he would be paying five times as much and Minerals Separation would get its dollar just the same.

It is perhaps purposeless at this time to go into detail concerning the different decisions in the now famous cases of Minerals Separation v. Hyde, Minerals Separation v. Miami Company, and Minerals Separation v. Butte & Superior. All three cases were fought through the several courts, and two of them, at least, reached the Supreme Court of the United States. As already pointed out, the most recent decision of that court fixes the status of the fundamental patent, namely, 835,120, as a fraction of 1% oil, and makes perfectly plain the effect of its original decision in the Hyde case. Minerals Separation is at last confined definitely to a royalty upon the use of the oil-froth where less than 1% of oil on the ore is used.

In order to recover in the Hyde case, Minerals Separation had to take a fixed and definite stand to the effect that its patent made an entirely new discovery, one wholly unknown to the previous art, namely, that with a percentage of oil away below any previously used, coupled with violent agitation, a new phenomenon appeared in the peculiarly coherent and persistent froth which was produced and which carried the metallic particles to the

surface, where they were easily skimmed and recovered.

Their counsel, before the Supreme Court of the United States, in answer to direct questions from the bench, announced that when the inventors began to cut down the quantity of oil below one-half of 1%, then first the invention began to appear, and it was their insistence that their invention lay in the very low percentage of oil used, thereby drawing a well-defined line between the claimed invention and the previous art, that they were enabled to maintain their process patent.

In that same litigation, they contended that their invention could not be practised with more than 1% of oil on the ore, but when it came to the Butte & Superior case, Minerals Separation very artfully took the position that no matter how much oil was used, and notwithstanding the fact that the quantity might be in excess of 1% in actual practice, nevertheless the efficient oil and consequently the oil of the process was less than 1%, that anything above the "critical proportions" referred to in their patent was surplusage and wholly ineffective, if not detrimental to the process, and that consequently any use of oil in flotation was an infringement upon their process.

This contention may have been quite natural, but if successful it would have meant that notwithstanding the fact that their patent confines itself to a fraction of 1%, it would, in effect, have been a patent upon any use of oil in the flotation and recovery of the metallic values in ores. This contention was very properly exploded by the Supreme Court in the Butte & Superior case. It was there said:

"From this consideration of the terms of the patent as written, it is apparent that it makes no differentiation whatever either in the claims or in the specification among the oils having a preferential affinity for metalliferous matter, and that its disclosure, to which the petitioner must be limited, is that when a fraction of one per cent on the ore of any such oil is used in the manner prescribed, there will be produced a metal bearing froth, the result of the process. No notice is given to the public and it is nowhere 'particularly pointed out' in the claims that some oils, or combinations of oils, having a preferential affinity for metalliferous matter, are more useful than others in the process, or that some may be used successfully and some not, or that some are 'frothing oils', a designation not appearing in the patent, and that some are not. The patentees discovered the described process for producing the result or effect, the metal bearing froth, but they did not invent that result or froth—their patent is on the process. It is not and cannot be on the result—and the scope of their right is limited to the means they have devised and described as constituting the process."

This decision of the Supreme Court undoubtedly ends the determined effort of Minerals Separation to acquire a complete and absolute monopoly of all oil-flotation, but unfortunately it does not end the grip of the monopoly on an essential and very practical part of the metal-producing industry.

FUTURE OUTLOOK. In the fall of 1918, complaint was made to the Federal Trade Commission that Minerals Separation was violating the provision of the act creating the Federal Trade Commission and also the provisions of the Clayton Act. After an investigation, a complaint was lodged by the Federal Trade Commission, and Minerals Separation Ltd. and all its subsidiaries and agents were made parties defendant in the proceeding. In due course, pleadings were filed on behalf of all the defendants. At this stage of the matter, your American Mining Congress took a hand on behalf of the mining industry of the United States.

The American Mining Congress, after a careful consideration of the situation, concluded that the proceeding before the Federal Trade Commission must be carried on, and that a complete determination of all questions involved in the complaint against Minerals Separation must, if possible, be thrashed out in the interests of all who were using or who might use the oil-flotation process; and undertook to answer the following questions from the authorities.

1. Are Minerals Separation North American Corporation and other respondents engaged in inter-state commerce, and are the transactions complained of methods in inter-state commerce?

2. Are the acts complained of methods of competition?

3. Are the practices of respondents in insisting upon terms in their license agreements which give them unified control over patents which, under separate control, might be used in competition with each other, and their control over inventions discovered by their licensees and their employees unlawful practices, in violation of law and public policy?

4. Has the Federal Trade Commission, in any event, jurisdiction in respect of the alleged exorbitant and discriminatory royalties?

I shall not undertake to discuss all the authorities bearing on these several questions of law, but I shall content myself with reference to a few of the general principles enunciated by the Supreme Court of the United States in decisions which conclusively show that the answer is 'Yes' to all four of the questions.

In the famous case of *Gibbons v. Ogden*, 9 Wheaton 1, Chief Justice Marshall said:

"Commerce undoubtedly is traffic, but it is something more. It is intercourse."

In *Pensacola Co. v. Western Union Co.*, 96 U. S. 1, it was said:

"It is not only the right but the duty of Congress to see to it that intercourse among the States and the transmission of intelligence are not obstructed or in any way encumbered by State legislation."

In *International Textbook Co. v. Pigg*, 217 U. S. 91, it was held that intercourse by means of correspondence through the mails, with agents and scholars, was interstate commerce.

In *U. S. v. United Shoe Machinery Co.*, 234 Fed. 127, 145, it was said:

"It is sufficient to say that as new methods of transact-

ing business are devised, if they are found to be in effect methods of carrying on commerce in any business, and the means for commercial transactions between the owner of the article on the one hand, and the person who wants to deal in it or use it in carrying on his business on the other hand, *whether it be manufacturing, selling, trading, leasing, transportation, communication, or information, and it is sent or transported from one State to another, it is inter-state commerce*, and therefore, subject to be regulated by Congress under the commerce clause of the Constitution."

In *Marienelli v. United Booking Offices*, 227 Fed. 165, it was held that booking performers for a theatrical circuit, which requires them to pass from State to State, taking with them paraphernalia and stage properties, constitutes inter-state commerce.

In the light of these authorities, when we take into consideration the fact that every license agreement put out by Minerals Separation requires the constant transmission from the point where the mining books of account are kept to the head office of the company in New York of all information in respect to concentrates produced, methods employed in operation, information as to assays, recoveries, discoveries, and the like, that it is sending its agents, engineers, auditors, and other representatives throughout the various States of the Union, there can be no question whatever but that it is engaged in inter-state commerce.

I have already pointed out the several provisions of the licenses granted by Minerals Separation which require all further discoveries and inventions by licensees or their employees be made over to it for its exclusive operation, use, and benefit. There can be no question but that Minerals Separation is engaged in methods of competition with respect to all inventors, manufacturers, vendors, and users of processes or apparatus which in no manner infringe upon or conflict with the processes practised and the apparatus used by Minerals Separation; but if it be answered that there are none such, that Minerals Separation is in the field alone, that it possesses, by virtue of the patent laws, a legal monopoly, the answer is that by its methods of licensing, by which it seeks to and does obtain an absolute and complete control over every discovery and invention of each and every licensee and all employees of its licensees, it is engaged in competition within the meaning of Section 5 of the Federal Trade Commission Act, for if its acts are designed to and do prevent competition against it on the part of other individuals or concerns which might be competitors and such acts are done for the purpose of stifling and suppressing competition, they must be regarded as acts actually directed against competitors, actual or potential, and in violation of Section 5 of the Federal Trade Commission Act. It surely does not need any argument to demonstrate that the most effective means of competition known to modern business is to stifle all such competition. This has been characterized over and over again as competition, and decisions of the Federal Trade Commission in the case against the Cudahy Packing Co.

and numerous other cases recognize and affirm the doctrine.

When we come to consider the question of public policy in respect to the methods employed by Minerals Separation, we should first consider again the fact that Article 3 of the license requires the licensees to communicate and turn over to Minerals Separation every invention or discovery made by them or their employees during the continuance of the license agreement, and that elsewhere in the agreement the duration of the contract is the term of the patents within the license, or any additional patents that may be added thereto by the licensors, and we then discover that the practical effect of the contract is to make its terms perpetual.

It may be seriously doubted whether, if this practice is permitted and the license is enforced in accordance with its strict terms, the licensees do not contract in such a way that notwithstanding the expiration of the fundamental patents by lapse of time, the contract will continue in force so long as Minerals Separation has any live patent on process or apparatus, and the licensees be required to pay tribute to the licensor for a period far beyond the time intended by the act of Congress in creating a patent monopoly.

Right here, it is well to call attention to the fact that in *Pennock v. Dialogue*, 2 Peters 1, decided in 1829, Justice Story said:

"While one great object (of our patent laws) was by holding out a reasonable reward to inventors and giving them an exclusive right to their inventions for a limited period to stimulate the efforts of genius, the main object was to promote the progress of science and the useful arts."

Again in *Kendall v. Windsor*, 21 How. 322, it was said:

"It is undeniably true that the limited and temporary monopoly granted to inventors was never designed for their exclusive profit or advances; the benefit to the public or community at large was another and doubtless the primary object in granting and securing the monopoly."

Referring to these cases and quoting from them with approval, the Supreme Court, in *Motion Picture Patents Co. v. Universal Film Co.*, 243 U. S. 502, said:

"The primary purpose of our patent laws is not the creation of private fortunes for the owners of patents, but is to promote the progress of science and the useful arts."

In *Straus v. American Publishers Assn.*, 231 U. S. 222, contracts otherwise clearly within the terms of the Sherman Act were claimed to be justified because of rights secured under the copyright laws of the United States, but it was said by the Court:

"It cannot be successfully contended that the monopoly of a copyright is in this respect any more extensive than that secured under the patent law. No more than the patent statute was the copyright act intended to authorize agreements in unlawful restraint of trade and tending to monopoly, in violation of the specific terms of the Sherman law, which is broadly designed to reach all combinations in unlawful restraint of trade, and tending,

because of the agreements or combinations entered into, to build up and perpetuate monopolies. . . . The patent statute and the Sherman act are each valid laws of the United States. While a patentee should be protected in the exercise of rights secured to the inventor under the patent system enacted into the laws of the United States, there is nothing in the act which gives the patentee a license to violate other statutes of the United States, and certainly not the one now under consideration."

From these references to and quotations from a few only of the many decisions to the same effect, it is seen that it is clearly against public policy to permit the owners of a patent monopoly to broaden and extend that monopoly beyond the strict limitations which the law gives as a stimulus to the inventive genius.

When we come to a consideration of the question as to the jurisdiction of the Federal Trade Commission in respect of the acts of Minerals Separation and the exorbitant and discriminatory royalties demanded by it, we find equally emphatic approval in the decisions of the Supreme Court under the Sherman Act. That act has been interpreted by the Supreme Court to authorize decrees not only enjoining proved violations of it, but also decrees "re-creating out of the elements now composing it a new condition which shall be honestly in harmony with and not repugnant to the law." *U. S. v. American Tobacco Co.*, 221 U. S. 106.

The decree, as finally entered, under the authority of the decision just mentioned, fixed the price at which the American Cigar Co. should sell its holdings in Federal Cigar Co., the price at which P. Lorillard Co. should sell its share in American Snuff Co., the price which American Tobacco Co. should charge Liggett & Meyers Co. and P. Lorillard for specified assets, brands, and good-will, and throughout the entire decree, other directions of similar character, in most minute detail were made in respect to many of the defendants, and many of their contracts and property rights.

In *U. S. v. du Pont*, 188 Fed. 127, defendant was directed to organize additional corporations, furnish them with cash working capital and facilities, transfer properties, facilities, information, etc.

In *U. S. v. U. P. Railroad*, the decree went into detail concerning shares of other corporations owned by it, the parties to whom they should be sold, the price to be paid, etc.

In many other cases, the decree finally entered upon decisions of the Supreme Court of the United States goes into most elaborate details of comment and direction.

It is thus seen that not only do the courts take cognizance of violation of specific statutes, but when they find that such violations have seriously affected the public interests, they go into detail in directing how these violations shall be corrected, the public interests subserved, and the people permitted to come into their own. These decisions have been followed repeatedly by the Federal Trade Commission in numerous determinations, and there can be no question but that that commission has jurisdiction to correct the abuses practised and at-

tempted to be practised by this most offensive monopoly.

Minerals Separation, originally incorporated with a capital of £15,000, had its capital increased on at least two different occasions, until at last accounts it had a total capital of £50,000. Minerals Separation American Syndicate had a capital of £52,500, and Minerals Separation American Syndicate (1913), Ltd., had a capital of £250,000. Minerals Separation North American Corporation was incorporated under the laws of Delaware, having a capital stock without par value, but inasmuch as it was organized practically for the purpose of taking over Minerals Separation American Syndicate (1913), Ltd., it very probably did not have a capital much larger than the concern which it absorbed. At all events, the total capitalization of the companies interested in the process patents probably does not exceed £500,000; but in order to be on the safe side, let us concede that these interests have a total capitalization of one million pounds, or five million dollars. It certainly is fair to assume that a considerable portion of this capital represents an estimated value of patent rights, as distinguished from actual money invested.

In the issue of the 'Journal of Commerce and Commercial Bulletin' of November 28, 1917, Minerals Separation published a paid advertisement, which among other things said:

"In North America and principally in the United States it is estimated that over one million tons of ore were treated by the process during 1914, 5,000,000 during 1915, and 25,000,000 during 1916, and that more than 50,000,000 tons will be treated during the present year. Great tonnages have been and are being treated in South America and Australia."

In the answer filed by Minerals Separation North American Corporation in the proceedings before the Federal Trade Commission, it is affirmatively alleged:

"That it (Minerals Separation North American Corporation) and its predecessors in title, have granted upwards of one hundred licenses in the United States that are now in full force and effect, and that the aggregate tonnage of ore milled and in part treated under said licenses is in excess of 28,000,000 tons per year."

Applying to this 28,000,000 tons the estimate made by Mr. Hoover that the average is 25c. per ton, we have an annual income of \$7,000,000 on a total capitalization which cannot exceed \$5,000,000.

Apply the same factor to Minerals Separation, Ltd.'s, own estimate for 1917, made when there was no incentive to minimize and boasting was not necessary and we have the very tidy little profit of \$12,500,000, or 250% per annum on the highest possible estimate of capital investment.

Even in these days of high costs, this would seem to be a wholly unwarranted profit wrung by the owners of the process patents from the mining industry.

It is hoped that the Federal Trade Commission will conclude to inquire into the amount of capital actually invested, the life of the original patents, and the probable tonnage to pay royalties, and then fix for Minerals Sep-

aration and its subsidiaries a rate of license-charge which will permit a fair return and no more upon such capital invested. Of course, in this connection the duration of the patent monopoly under the law is an important item and an element which must have a controlling influence. At the same time, the efforts which have been and are being made to establish a monopoly which shall have a duration beyond the statutory limit of patent-right should be checked, and the scheme for laying a perpetual tribute on the mining industry should be frustrated.

RESOLUTION adopted by the American Mining Congress in convention at St. Louis on November 21, 1919.

WHEREAS, on November 12, 1918, the Federal Trade Commission commenced a proceeding against Minerals Separation, Ltd., its subsidiaries and its agents, charging them with stifling and suppressing competition, and monopolistic and oppressive practices, and violations of the Clayton Act and the Federal Trade Commission Act, in that their contracts and methods have tended (a) to prevent independent inventors and independent manufacturers from licensing and selling independent processes and independent apparatus, and (b) to prevent mine operators from using independent processes and independent apparatus, and (c) to require independent inventors and independent manufacturers to pay to Minerals Separation, Ltd., its subsidiaries and its agents, exorbitant commissions as the condition of licensing and selling their own processes and apparatus, and (d) to discriminate unfairly, as between manufacturers and inventors similarly situated, in respect to the commissions thus exacted by Minerals Separation, Ltd., its subsidiaries and agents, (e) to compel mine operators, metallurgists and engineers to surrender their own inventions to Minerals Separation, Ltd., its subsidiaries and its agents, and (f) to prevent mine operators, metallurgists, and engineers from publishing data regarding flotation, and (g) to compel mine operators, metallurgists and engineers to withhold information regarding flotation in event of litigation, and (h) to exact from mine operators an exorbitant royalty for the use of the processes of Minerals Separation, Ltd., its subsidiaries and its agents, and (i) to exact from mine operators royalties upon the use of processes and apparatus in which Minerals Separation, Ltd., its subsidiaries and its agents, have no rights whatsoever, and (j) to discriminate unfairly, as between mine operators similarly situated, in respect to the royalties thus exacted by Minerals Separation, Ltd., its subsidiaries and its agents, and (k) to disparage, falsely and maliciously, independent processes and independent apparatus, independent inventors and independent manufacturers, and the users and patrons of such independent processes, independent apparatus, independent inventors and independent manufacturers, and (l) to claim, falsely and maliciously, exclusive rights in excess of those actually possessed by Minerals Separation, Ltd., its subsidiaries and its agents, and (m) to threaten, with malice, patent infringement suits based upon claims of exclusive rights exceeding those actually possessed by

Minerals Separation, Ltd., its subsidiaries and its agents, and (n) to intimidate and coerce mine operators to refrain from using or patronizing independent processes, independent apparatus, independent inventors and independent manufacturers by threatening to withhold from such mine operators licenses under Minerals Separation processes and apparatus, and (o) to coerce independent inventors and independent manufacturers, through the tactics above described, to enter into oppressive agreements with Minerals Separation, Ltd., its subsidiaries and its agents; and

WHEREAS, the American Mining Congress has already filed with the Federal Trade Commission a brief upholding the Commission's jurisdiction in its proceedings against Minerals Separation, Ltd., its subsidiaries and its agents, and the Special Counsel of the American Mining Congress, in his masterly report before this convention, has made clear that the mining industry of the United States, now and for all future time, will be in bondage to Minerals Separation, Ltd., its subsidiaries and its agents, unless the proceeding brought by the Federal Trade Commission is prosecuted to a successful conclusion; now, therefore, be it

Resolved, by The American Mining Congress in convention assembled, with members and representatives present from every mining State in the Union, That The American Mining Congress hereby endorses and commends the proceedings of the Federal Trade Commission against Minerals Separation, Ltd., its subsidiaries and its agents, and endorses and approves the action of the officers and the Special Counsel of The American Mining Congress in supporting the Commission's proceedings; and be it further

Resolved, That The American Mining Congress hereby pledges the assistance of its officers, its special counsel, its Chapters and its members to assist the Federal Trade Commission in its proceedings to terminate the intolerable bondage which Minerals Separation, Ltd., its subsidiaries and its agents, have now imposed, and hereafter in perpetuity threaten to impose, upon the mining industry of the United States.

TWENTY-FIVE gold-lode mines were operated in Alaska in 1918, according to the U. S. Geological Survey. There was also a production from seven prospects—abandoned mines or small mines that were not in regular operation. The value of the lode-gold output decreased from \$4,581,453 in 1917 to \$3,473,317 in 1918, owing partly to the disaster at the Treadwell mine in April 1917, and partly to curtailment of operations, especially in the Juneau district, because of shortage of labor. South-eastern Alaska, especially the Juneau district, is still the only centre of large quartz-mining operations in the Territory. The production in the Fairbanks district decreased materially, as the lode-mine owners of Fairbanks are still awaiting the cheapening of operating costs, especially of fuel, which is expected on the completion of the Government railroad. In 1918 the average value of the gold and silver contents for all silicious ores mined was \$1.70.

A Question of Boundaries

By ARTHUR J. HOSKIN

In the district court at Leadville there has just been tried a case involving the early history of mining in Colorado. Discussions in the case have covered the whole existence of the State: they have even antedated statehood.

In November 1861 the Territorial legislature passed a statute defining the boundaries of the original 17 counties in the proposed state of Colorado. Until comparatively recently no serious controversies have arisen relative to these boundaries and the present trouble would not have arisen except for the discovery, a few years ago, of a remarkable deposit of low-grade molybdenite ore in the central part of the State. During the Great War this deposit received intensive exploitation, large mines were developed, and several large concentration mills were erected.

The orebodies occur as shoots in an eruptive sheet outcropping along the continental divide between Leadville and Kokomo. For years it was assumed that the flag-station of Climax at Fremont Pass on the Blue River branch of the Denver & Rio Grande railroad was also upon the line between the counties of Lake and Summit. The molybdenum mines and mills are close to Climax. When the location and patenting of mining claims became an active issue as a result of the molybdenum boom, controversy quickly arose between these two counties as to the possession of this mineralized zone. Among matters annoying to locators was the fact that the two counties permit lode-locations of unequal maximum widths, Summit county being one of the four counties in the United States that continue to limit the width of a lode-claim to 300 ft. Then there has been uncertainty as to where official records should be filed. The county officials were concerned chiefly over the collection of taxes.

The statute of 1861 defined the boundaries of Park, Lake, and Summit counties as follows, such portions of the descriptions as have no bearing on this issue being omitted:

PARK COUNTY. Commencing at a point where the second correction line south intersects the Platte river; thence west to the summit of the snowy range east of the Arkansas river; thence in a northerly direction along the divide between the Arkansas and Platte rivers, and around the head waters of the Platte river and its branches; thence easterly along the snowy range dividing the waters of the Platte from the waters of the Blue, to the point of intersection with the first correction line south; to the place of beginning.

LAKE COUNTY. Commencing at a point on the summit of the snowy range, at the north-west corner of the county of Park, and running due west to the western boundary of the Territory; thence east on the northern

boundary of said (Fremont) county to the summit of the range dividing the waters of the Platte and Arkansas rivers; thence northerly on said summit to the place of beginning.

SUMMIT COUNTY. All that portion of the Territory bounded on the south by the county of Lake, and on the east by the summit of the snowy range, and on the north and west by the Territorial boundary.

Lake and Summit counties were originally very large, although each is now relatively small. Numerous counties have been carved from all the original counties of Colorado. It appears that the legal boundaries of practically every county in the western part of the State hinge upon a geographical point stated in the statute as

MAP OF PART OF COLORADO

“the north-west corner of Park county”. Any change now in the locus of the line between Lake and Summit counties would involve the dividing line between Lake and Eagle counties, Pitkin and Eagle counties, Pitkin and Garfield counties, and Mesa and Garfield counties. Garfield and Mesa counties are west of the limits of the accompanying map. A decision in the present case in favor of Lake county will provide endless business for members of the legal fraternity.

It is strange that such a controversy could arise—that it could attain the dignity of an important lawsuit—when the dispute rests solely upon the identification of a great natural landmark or geographic point. The statute specifies the northern boundary of Lake county as a due-west line starting at the north-west corner of Park county and extending to the Territorial boundary. The law does not say that the boundary line follows the crest of any ranges. Where, then, is the north-west corner of Park county?

Most persons, looking at the map, would declare off-hand that the north-west corner of Park county is the

western extremity of the east-west line forming its northern side; but this view of the matter is so obviously at odds with the intent of the framers of the statute that this position has been disregarded by both sides in the dispute. This suit was brought by the commissioners of Lake county against the commissioners of Summit county. A suit is now pending between the commissioners of Lake and Eagle counties.

The law mentions the line between Park and Lake counties as the summit of the range dividing the waters of the Platte and Arkansas rivers. This is now known as the Mosquito range, a lofty spur of relatively late geologic time and terminating in the continental divide at the point X on the map. Witnesses and experts for Summit county were unanimous in contending that the point X—which is Mt. McNamee—is the only geographic point that can satisfy the statute as “the north-west corner of Park county”. Mt. McNamee is the vertex of three large watersheds—the Platte to the south-east, the Arkansas to the south-west, and the Blue to the north.

The Lake county experts placed this corner at Y, basing their contention solely upon an interpretation of the phraseology in the old statute: “and around the headwaters of the Platte river and its branches” and insisting that this clause describes a portion of the westerly side of Park county. Just why a corner was decided upon at Y, an un-named peak, instead of some other peak farther to the north and east in the continental divide was not made obvious during the trial. Lines projected westward from X and Y enclose the molybdenum area shown in solid black on the map. The case simmers down to a dispute concerning two points that are more than one and a half miles apart. The State Engineer of Colorado surveyed the line from Mt. McNamee and this starting-point was never doubted by anyone until the present argument arose about three years ago. It is possible that the pioneer law-makers of Colorado were not sufficiently precise in their descriptions of county boundaries; if so, we may allow them the excuse that this region was then an unsettled wilderness, the geography of which was not well understood.

The case was tried by Judge Henry J. Hersey of Denver. Among the witnesses for Lake county were J. M. Kleff, George H. Heitz, Howard W. Platt, Ross R. May, and Douglas Platt, all mining engineers of Leadville. The witnesses for Summit county were Victor G. Hills and Arthur J. Hoskin of Denver; William H. Lea, surveyor for Eagle county; James D. Galloway, surveyor for Summit county; W. H. Powless, surveyor for Park county; and Fred J. McNair, surveyor for Lake county. The decision in this case was made September 30 by Judge Hersey. William C. Robinson, attorney for Summit county, immediately requested a new trial and is given thirty days in which to file his reasons. The attorney for Lake county was John A. Ewing.

MOST MINES on the Rand are comparatively dry, but in recent years a large amount of water has been used for allaying dust, which has required the use of elaborate pumping plants.

Gold and Silver

*Silver production for the United States in 1918 amounted to 67,810,139 oz. Production has been gradually decreasing since 1915 when it amounted to 74,961,075 oz. At that time the average price of silver was 50.7 cents whereas in 1918 the average price was \$1 per ounce. A table comparing prices and production since 1912 follows:

| Year | U. S. Production | Average Price |
|------------|---------------------|------------------|
| | Oz. | \$ |
| 1912 | 63,766,800 | 0.615 |
| 1913 | 66,801,500 | 0.604 |
| 1914 | 72,455,100 | 0.553 |
| 1915 | 74,961,075 | 0.507 |
| 1916 | 74,414,802 | 0.658 |
| 1917 | 71,740,362 | 0.824 |
| 1918 | 67,810,139 | 1.00 |

Although silver has increased in value at the average rate of about 16½¢ per year for the past three years it would seem to have had little influence on increased production. The output of silver is greatly influenced by the production of the base metals copper and lead. Roughly 40% of the output of the western hemisphere (which in turn produces about 80% normally of the world's output of silver) comes as a by-product in the mining and reduction of those base metals. Any condition affecting the latter will make itself felt in the silver market. It would appear that improvements in base metal milling and mining operations are more to be looked to in increasing the production of silver, coupled with further discoveries of new ore deposits, than an increase in the price of silver itself. The drastic decrease in copper production during the early part of the current year in this country, the almost incessant labor unrest in the copper, silver, and lead industries, and the strikes in the important silver-mining districts on this continent, point to a substantial decrease in current yearly production.

Gold production for 1918 shows a decided drop from 1917 in the United States. From 1913 to 1917 the production has averaged annually about 4,450,000 oz. Last year the output amounted to 3,313,373 oz.; in 1916 it was 4,479,056 and in 1917, 4,051,440 oz. There is little stimulus to increased production of gold, the added cost of materials and labor forcing many projects to be abandoned. In the case of inactive mines a re-opening is usually costly and may entail considerable unwatering, re-timbering, and extra labor. Over \$100,000,000 worth of gold has been shipped to the Far East since the embargo in the exportation of gold was lifted on June 1. Considerable gold has also found its way to South America to strengthen the exchange-rate between the United States and countries on that continent. There is an increased demand for gold and silver products in the arts. Gold production on the Rand in South Africa has been somewhat below normal; during August 1919 it was 706,000 oz., and the month previous 725,000 ounces.

*Excerpts from monthly reports on minerals investigations of the U. S. Bureau of Mines.

REVIEW OF MINING

FROM OUR OWN CORRESPONDENTS IN THE FIELD

ARIZONA

CURTAILMENT AT COPPER QUEEN.—COAL SHORTAGE.

DOUGLAS.—The Copper Queen reduction works of the Phelps Dodge Corporation has practically completed arrangements for reduction in its production, recently decided upon. Tonnage of Copper Queen ores has been reduced to supply approximately 5,000,000 lb. per month. **Moctezuma Copper Co.**, at Nacozeni, will supply about

come for the purpose of attempting to borrow coal from other operators in the district, in sufficient quantity to supply the power-plant of the smelter until oil-burning apparatus could be installed under the boilers. If this could not be done, Mr. Douglas said, it would be necessary to close down the property for a time, throwing a number of men out of employment. United Verde Extension had been obtaining its supply of coal from the Gallup, New Mexico, district which is producing no coal at present.

A VIEW OF THE U. V. X. MINE, SHOWING THE CONTACT OF THE DARK BASALT AGAINST THE WHITE LIMESTONE

2,000,000 lb., and custom ore about 500,000 lb. This is a reduction of about 1,500,000 lb. from the November output. A furnace and one converter were closed down. That no further reduction in output or number of employees is expected to be made at this time has been learned from authoritative sources. The company, in discharging the few men who had to be let go, observed its usual rule by holding heads of families in preference to single men. The C. & A. company also has begun reducing production, but to what extent has not been stated officially.

JEROME.—James S. Douglas, president of the United Verde Extension Co., reached here December 3, having

Other mining properties in Arizona are similarly threatened, it is stated, but many of them have installed oil-burners and will be able to continue as long as the railroads run.

COURTLAND.—Diamond-drilling may solve the development problem of the Courtland district, the ups and downs of which have been noteworthy in the mining world, for the last 10 years. By use of a diamond-drill the Great Western Copper Co. has outlined a body of copper ore said to be of large extent and its three-compartment shaft is now entering this ore-zone at 350 ft. The shaft has already penetrated the ore between four and five feet. Such favorable results were obtained by

diamond drilling that a prospect shaft which had been sunk to the depth of 200 ft. has subsequently been enlarged to a three-compartment shaft. It has been decided to sink this to the depth of 300 ft., which will be the deepest working in the district. Lack of depth has been the greatest handicap under which the Courtland district has labored hitherto, in the opinion of many people who have watched it carefully. The Great West ern strike is of importance as giving encouragement to the hope for better things to follow. Courtland was the scene of a historic rush about ten years ago.

TOMESKANE. The Solstice Mining & Milling Co., better known locally as the Winter's mine, has been sold to Will T. Boyd and associates for a price said to range well into the thousands. Steps will be taken by the purchasers in the immediate future to put the mine in operation. The Solstice formerly was a producer and is said to have considerable silver ore of shipping grade, while there is evidence in surrounding properties of continuity of the orebodies at depth.

BISSIE. The Shamrock-Arizona mine is speeding up production of lead-silver ores, which are being handled by its mill at the rate of 300 tons per day. A slight improvement has been made in recovery so that the mill now shows a small profit per ton on all ore handled.

MICHIGAN

PRODUCTION FIGURES FOR NOVEMBER

HARBOR. The close of navigation came suddenly the first week in December. There is more copper on the docks and in storage in the various smaller warehouses than at any previous time during the past 20 years. The situation was relieved considerably just before the ice formed in the harbor. On the day before the lake froze over all the copper of the Michigan, Wolverine, and Mohawk corporations was shipped out on hurry up orders from the eastern office. Much of this copper was sold for foreign shipment. In addition to this accumulated output of the so-called Stanton mines, the Copper Range companies made some important shipments by water to the East on November 20. This included a large German shipment. The Stanton and Parne mines are practically "cleaned up" of metal and the Quincy is in better shape than 30 days ago by a considerable amount. None of these properties stood its share of the retrenchment program which went into operation in this district last spring.

Production of copper from the mines of the Lake Superior district for November was about the same as for October. In fact, a preliminary survey of the situation indicates practically no change in either the total output or in one of the individual mines. The Okechewie Consolidated output from the Old Canada and the North Kew ranges which was 14,000 tons of ore, running 16 lb. per ton, so that the net metal amount will be more than 220,000 lb., compared with 216,232 lb. in October and 241,100 lb. for September. Hancock produced 65,000 tons of ore in November compared with 65,000 tons in October but it is estimated the yield will be 24 lb. per ton, which was an

average increase of 2.2 lb. over September. Isle Royale handled 65,000 tons, a slight decrease as compared with October. Isle Royale's average yield will reach 20 lb. per ton if the present improvement continues. This is creditable to the management, for the mine was operating on a basis of 18 lb. in 1916, 14.6 in 1917, and 15.9 in 1918. Allouez produced 15,000 tons in November, Centennial 7000, Mass Consolidated 14,000 with a considerable showing of mass and barrel copper. La Salle and Superior sent down just a few cars taken out in development. Hancock is gradually increasing its working force. Three additional drills started last week. Seneca is not yet shipping. Regional, divisional, and national officials of the railway service are being importuned constantly by mine officials to get a rate sufficiently low to permit ore shipments.

NEVADA

DEVELOPMENT AT DIVIDE—NEW CONSOLIDATION OF GOLD-FIELD PROPERTIES

DIVIDE. The Belcher Extension at a depth of 30 ft. in a prospect shaft being sunk near the Thompson boundary line has opened ore reported to assay \$814 for a 10-in. width \$440 for a 2-ft. width, and for a second 10-in. width \$644. At 35 ft. the assays were: 26 in., \$420, 10 in., \$930, 8 in., \$1390. The discovery is regarded as one of the most important ever made in this district, as sampling of the vein at the surface during the period of the labor trouble indicated the existence of an ore-shoot with a possible maximum length of 1000 ft. and a minimum of 500 ft. Trenching and sampling on a large scale gave good assay returns for widths of from a few inches to 4 ft. over a distance of 500 ft., 300 in the Belcher Ex., and 200 in the Belcher, with additional sampling giving lower returns for another 500 ft. The vein strikes almost due east and dips south at 60° in the Belcher Ex. It is reported that the vein has been entered by a cross-cut from the bottom of the 200-ft. Caldwell shaft of the Divide Extension and an announcement to this effect by the management is expected in a short time. The cross-cut being driven by the Dividend at a depth of 75 ft. in the new shaft, near the Divide Ex. line, has entered the extension of this vein and a drift is being driven to open the ore-shoot. The Victory, at a depth of 230 ft., has cut the vein striking south-west into the Butte; thus far only announcement assays have been secured. This vein crosses the main ore-channel of the district, in which the rich ore was found in the Belcher Ex.

ARROWHEAD. The ore-shoot in which the east drift on the 100-ft. level of the Arrowhead is being driven, has reached 8 ft. the average toner for this width being \$140, with some assays as high as \$2000. A drift on the 175-ft. level is close to this shoot. Other companies are starting work rapidly and a number of shafts are opening veins from which lateral work will be started. This district is attracting wide attention in the southern part of the State and a town is growing rapidly.

GOVERNMENT. The Red Lion, Desert Chief, and New Goldfield-Sierra properties, long inactive, have been con-

solidated with the Yellow Tiger, which is now preparing to levy an assessment for funds to resume work. Interested in the deal are H. G. McMahon and A. I. D'Arcy of the Goldfield Development Co., who, with H. A. Riedel, former president of the Yellow Tiger, will be directors in the new organization. The Yellow Tiger now owns 350 acres in the district, 135 of which are practically contiguous in the southern part. There is a 772-ft. shaft on the Jackass group, the main Tiger claims, and a large amount of development work was done before the company discontinued work 10 years ago. At that time small shoots of ore were exposed on the 700-ft. level that assayed as high as 14% copper, 16 oz. silver, and 0.48 oz. gold. The vein at this depth is 70 ft. wide, the ore being found on the hanging wall. The surface of the entire

combination mine of the Development company at a point midway between the Combination shaft and the Florence line. Next to the rich seam is another, 18 in. wide, that assays \$175. The ore has been followed for only a short distance.

SIMON DISTRICT.—A number of companies that started work at the height of activity in the district have suspended operations. This includes the West Extension. A cross-cut from the bottom of the 280-ft. shaft of the Simon Mina has been driven 75 ft. toward the main vein of the district and is expected to cut the vein within an additional 60 feet.

PIONEER.—There is 75,000 tons of ore of an estimated grade of \$12 per ton blocked out in the Mayflower, according to J. B. Kendall, manager for the company. De-

ELECTRIC HAULAGE IN A MICHIGAN COPPER MINE

acreage will be prospected before work is resumed, and a new shaft may be sunk at a point from which the Jackass and Red Lion groups can be developed economically. The present shaft is 1400 ft. from the Red Lion line. This is the most important transaction in the district since the Development company was formed and the Florence changed hands, as it promises the exploration of territory far outside the proved zone. The production of the Florence for 1919 will be \$252,000, according to preliminary estimates by E. A. Byler, engineer for the company. From July 1 to October 1 the Florence Divide lease shipped \$129,741 worth of ore; the production to date has been over \$174,000, the latter figure being based on eleven additional 45-ton shipments since October 1, which were not included by Mr. Byler. Five feet of ore, 20 in. of which assays \$39, with the remainder assaying \$20, has been opened in a 15-ft. raise on the 815-ft. level of the Grandma. This is the widest shoot found in the Grandma since work was started. From 12 to 14 in. of ore reported as assaying from \$3200 to \$6300 has been opened on the 250-ft. level of the Com-

velopment work is being done on the 200, 300, 400, and 500-ft. levels. The main north drift on the third level has been driven 1000 ft. and it is estimated that it will enter an important ore-shoot during the course of the next 200 ft. The mill for the first time is treating ore at the rate of 50 tons daily. Mr. Kendall estimates the value of the monthly production of the mill at from \$8000 to \$10,000, with the net at from \$4000 to \$5000.

ROUND MOUNTAIN.—Tonopah and Goldfield men have optioned the Silver Shield, in Horse canyon, six miles north-east of Round Mountain, for \$50,000 and have made a first payment of \$5000. The mine has been worked for many years, at one time by Mexicans, the principal development being a 200-ft. shaft and a 400-ft. drift-tunnel, both in a porphyry hill. The greatest depth of the tunnel is 160 ft. and, according to Dr. J. L. McCarthy of Goldfield, one of the holders of the option, the ore-channel at this depth is 22 ft. wide, the silver ore being of milling grade. Several cross-cuts, four raises, and a winze expose the vein, the bottom of the winze, 40 ft. deep, being in rich ore. The ore contains stephanite,

with rich seams in chloride form and a small gold content. The lowest assay secured from a large dump at the entrance to the tunnel was 20 oz. silver.

UTAH

COAL MINERS' WAGES INCREASED.—UTAH COPPER DIVIDENDS.
—NOTES.

SALT LAKE CITY.—Notices announcing an average increase of 14% in the wages of all Utah coal miners and employees of coke ovens were posted November 29, according to A. D. Pierson, general sales agent of the Utah Fuel Co. Speaking in behalf of the Utah coal operators, Mr. Pierson said that this advance in wages will increase the average cost of producing coal from 25 to 30c. per ton, and means an increase of between \$1,250,000 and \$1,500,000 per year in the payrolls of Utah coal-fields. The coal operators are obliged to absorb this wage advance, as the Federal Administration will not permit them to add anything to the present Government price of coal. The prices at the mines, established by the Fuel Administration, are \$3.65 per ton for screened or prepared sizes, \$3 for mine run, and \$1.85 for slack. The Utah coal operators have always prided themselves on maintaining good wages and satisfactory working and living conditions in and around their mines. The operators are unanimous in paying tribute to the loyalty of their men, who remained at work during the recent strike, thereby performing a most important public service. The increase in wages just made, without any increase in the price of coal, will be a heavy burden, even for the strongest producing companies. There is no way in which the operators can, to any appreciable extent, offset this increase in cost of production, except through an increase in the efficiency of their employees.

At the quarterly meeting of the directors of the Utah Copper Co., held in New York City on December 2, a dividend of \$1.50 per share was declared, payable December 31. With the close of the current year, dividend disbursements by the Utah Copper will have passed the one-hundred-million dollar mark. Since its initial dividend on September 30, 1908, this company has distributed the following amounts to its stockholders:

| Year | |
|------|--------------------|
| 1908 |\$ 696,387.50 |
| 1909 |1,464,387.50 |
| 1910 |4,648,675.00 |
| 1911 |4,703,022.00 |
| 1912 |4,729,747.50 |
| 1913 |4,747,710.00 |
| 1914 |4,827,885.00 |
| 1915 |6,904,082.50 |
| 1916 |19,493,880.00 |
| 1917 |23,555,105.00 |
| 1918 |16,244,900.00 |
| 1919 |9,746,940.00 |

Grand total\$101,762,722.00

The cold wave which hit Utah on November 26 gave the Utah Power & Light Co. considerable trouble and interfered with mining and milling operations. Mush-ice in the streams in Idaho and Utah made it impossible for

the plants of the company to generate the usual amount of power on November 26 and 27. Among the milling plants affected in this vicinity was that of the Utah Copper Co. at Arthur, which was forced to curtail operations almost 50% for nearly 24 hours.

Walter Fitch, Jr., the Tintic mining contractor, left Salt Lake City on December 3 in company with Murray C. Godbe, general manager for the Prince Consolidated Mining Co., for Pioche, Nevada, to size up a contract for sinking a new shaft contemplated by the Prince company. Diamond-drill operations have revealed good ore deposits at depth. Mr. Fitch put down the first 400 ft. of shaft and the Prince Consolidated company is now sending the shaft down an additional 500 ft. The water-level in the mine has just been reached, and Mr. Fitch will look over the work with a view to taking a contract to sink 400 ft. of shaft from the water-level.

PARK CITY.—Shipments from this district for the week ending November 29 totaled 1698 dry tons, of which the Silver King Coalition shipped 549 tons; the Ontario Silver, 494 tons; the Judge M. & S., 340 tons; the Daly West, 145 tons; the Silver King Consolidated, 110 tons; the Naildriver, 55 tons; and the New Quincy, 6 tons.

M. J. Dailey, general manager for the Silver King Coalition, has been at the property throughout the week. Several important discoveries have been made in new territory, and prospects for increased production were never better. It is understood that portions of the mine abandoned by former superintendents are being cleaned out and re-timbered. Forrest Mathez was recently appointed superintendent.

On December 1 another shift was put on at the mine of the Judge Mining & Smelting Co., according to O. A. Friendly, superintendent. This means that the output will be practically doubled. This announcement will put to flight recent rumors that the ore was 'pinching out' in this old-time producer. The employees of the company are increasing the volume of their orders for foodstuffs, under the plan, recently introduced by the management, of purchasing carload quantities of supplies, which are sold to the men at cost, thus offsetting some of the recent rise in prices.

ALTA.—As is the case at most of the properties in this district, operations at the Columbus-Rexall mine have been slowed down by the inclement weather, which set in unusually early this year. Sufficient snow has fallen to spoil the roads for wagons, but not enough to make it possible to haul ore and mining supplies with sleighs.

EUREKA.—Shipments from the mines of the Tintic district for the week ending November 29 totaled 150 cars. While slightly less in volume as compared with the previous week, this shows that the mines here are maintaining the increased rate of shipments of the past few weeks. As usual, the Chief Consolidated heads the list, with Tintic Standard second. The mines shipping and number of cars for this week are: Chief Consolidated, 40; Tintic Standard, 27; Dragon Consolidated, 12; Colorado, 12; Iron Blossom, 12; Mammoth, 9; Centennial Eureka, 8; Eagle & Blue Bell, 8; Grand Central, 7; Bul-

lion-Beck, 2; Gemini, 2; Ridge & Valley, 2; Sunbeam, 2; Victoria, 2; Gold Chain, 2; Utah Con., 1; Empire Mine, 1; and Swansea, 1.

Operations at the Eureka Bullion mine are proceeding satisfactorily. The winze on the 800-ft. level, which is being sunk at the rate of approximately 80 ft. per month, is now 110 ft. deep. The objective of the winze is the intersection of an east break which dips about 85°, and a west break with a 75° dip. It is the intention of the company to use this winze for depth operations.

The face of the May Day drift is being advanced rapidly by the contractors, according to George H. Dern, manager of the property. This drift, being driven from

WISCONSIN

REVIEW OF THE ZINC, LEAD, AND PYRITE INDUSTRIES FOR NOVEMBER.

Ideal conditions from an operating standpoint during the month of November failed to stimulate production in the Wisconsin field, low markets and high costs no doubt contributing toward a conservative mining program. A noticeable cause for complaint with all operators was found in the scarcity of shovelers, although a scale of prices has been established enabling good men to earn as high as \$6 to \$7 per shift. One of the larger operating groups introduced a system of 'Industrial Democracy',

GENERAL VIEW OF THE TOWN OF BINGHAM CANYON, SHOWING THE MINE OF THE UTAH COPPER CO. IN THE BACKGROUND, AND THE BINGHAM & GARFIELD RAILROAD IN THE CENTRE

the 1800-ft. level of the Yankee shaft, is in a favorable lime formation. Approximately 750 ft. of the distance remains before the objective of the drift, an extension of the May Day shoot that produced heavily in the upper workings, will be cut. Close to 250 ft. of driving has been done in a period of slightly over a month.

BINGHAM.—Production at the Utah-Apex is being steadily increased, and has now reached 500 tons per day. According to present plans, officials expect to have the output up to 1000 tons per day some time during the early part of the coming year. The product from the mine averages 12% to 14% lead, and also carries considerable silver. With lead at 6½ to 7c. per pound and silver around \$1.30 per ounce, earnings are excellent. Operations are still handicapped by a shortage of experienced miners.

and savings on cost of production, through intensive individual effort, were distributed among men engaged 13 consecutive shifts. This, with the additional bonus of 1c. per 'can', for shovelers of all classes, working six consecutive shifts, enabled the men to earn as high as \$35 to \$45 per week.

Prices for zinc ore have been steady, although not entirely satisfactory to shippers. The base on prime western blende at the beginning of the month stood at \$50 per ton, continuing at this level until the third week, when an increase of 50c. per ton was announced. The closing days of the month found the base for premium blende quoted at \$51.50 per ton, 60% zinc, on which base zinc ore recovered at the local reduction plants would be commanding a price of nearly \$55 per ton. Second-grade zinc ore was in better demand toward the close of

the month and shipments of run-of-mine ore showed considerable improvement. Low-grade zinc-ore producers fared indifferently the greater part of the month, quotations running from 60c. to 70c. per unit of zinc. The reserve in the field is: milled ore, 6000 tons; high-grade refinery ore at separating plants, 2200 tons.

Lead-ore production made appreciable gains during the month, mainly on account of the richness of the lode at the Big Dick mine, in the Cuba City district, where the mill output runs from 10 to 20 tons daily. This was also true of exclusive lead-ore producers at several points in the field, most of the lead concentrate being carried over. Price offerings were good all month beginning at about \$80 per ton, 80% lead content, and advancing the first half of the month to \$82 per ton. The second half of the month witnessed a smart advance, foreign quotations going to \$88 per ton. Local buyers insisted they could not meet this demand on long hauls to smelter and the best price paid in the Wisconsin field was on a base of \$85 per ton. Operators profess to see, in the metal-market conditions, the near prospect of higher offerings and prefer to hold their ore awaiting developments. The reserve in the field at the end of November is conservatively estimated at 1200 tons.

The recovery of pyrite at separating plants continued in proportion to the tonnage handled. While conditions in the acid market showed some improvement, the better tone was not communicated to local ore markets and shipments for the month were of an indifferent nature, one of the leading establishments long actively engaged in marketing this class of ore retiring entirely. The reserve increased at all of the refining plants, and at the close of the month is considerably in excess of 5000 tons.

Better prices all month for carbonate zinc ore ranging from \$27 to \$35 per ton, 40% zinc, stimulated deliveries. More than 1900 tons was marketed. This type of zinc ore came entirely from the mines of the Highland district. Independents were given an opportunity to come into the market for the first time in several months but the bids for ore, locally, were not up to the figures given out in the standard publications. Production is not being encouraged until offerings show substantial improvement. A better market for paint pigments afforded an outlet for large stocks of oxide zinc in the hands of smelters and this forward movement, it is believed, will encourage heavier production of carbonate zinc ore in this field.

Deliveries of ore, for the month of November, by districts, follow:

| District | Zinc, lb. | Lead, lb. | Pyrite, lb. |
|-------------------|--------------|--------------|----------------|
| Benton | 12,084,000 | 336,000 | 1,402,000 |
| Livingston | 4,154,000 | | |
| Galena | 3,818,000 | 480,000 | |
| Cuba City | 1,976,000 | 660,000 | 464,000 |
| Hazel Green | 1,202,000 | | |
| Highland | 1,140,000 | | |
| Platteville | 572,000 | | |
| Shullsburg | 552,000 | | |
| Linden | 342,000 | | |
| Dodgeville | | 54,000 | |
| Total | 25,840,000 | 1,530,000 | 1,866,000 |

Deliveries of high-grade refinery ore, from separating plants to smelters, were made as follows:

| | Lb. |
|------------------------------------|------------|
| Mineral Point Zinc Co. | 5,062,000 |
| Wisconsin Zinc Co. | 3,882,000 |
| National Zinc Ore Separators. | 3,000,000 |
| Linden Zinc Co. | 530,000 |
| Block-House Mining Co. | 572,000 |
| Total | 13,046,000 |

The gross recovery of zinc concentrate at mills amounted to 12,920 tons. Net deliveries to smelters from mines and refineries were 8700 tons. Of raw ore deliveries made to refiners direct, the Mineral Point Zinc Co. received 4876 tons; National Separators, 3540 tons; Wisconsin Zinc Co., 2679 tons; Linden Zinc Co., 339 tons. The refinery shipments were: to the Mineral Point Zinc Co., 2531 tons; Grasselli Chemical Co., 1438 tons; American Zinc Co., 1304 tons; American Metal Co., 1297 tons; United Zinc Smelters, 447 tons; Illinois Zinc Co., 167 tons.

BRITISH COLUMBIA

TAXATION OF GOLD MINES.—MEETING OF CANADIAN MINING INSTITUTE.

SKEENA.—The Drum Lummon copper mines will be worked on a considerably larger scale next year, and new equipment will be added to the present plant. Last year the company erected a small concentrating plant and a gasoline-driven compressor, besides doing several hundred feet of development and breaking down a considerable tonnage of ore. During the past season about ten tons of high-grade and concentrate were shipped each month.

GRAND FORKS.—A. E. Savage has been given a contract to drive a 1000-ft. tunnel at the Little Bertha-Pathfinder mine to cut the Little Bertha orebody at depth. Should the tunnel succeed in cutting good ore it will be continued for another 1000 ft. to cut the orebody on the Pathfinder claim. Both these claims produced good ore at the surface several years ago. Capitalists from the United States have taken up the bond on the Union mine, which they acquired earlier in the season. Development work will be carried on during the winter. The force of men at the Molly Gibson has been increased. The ore is being rawhided to the railway over the snow.

KASLO.—The custom concentrator has been closed for the winter through lack of ore to keep it running. A shipment of 77 tons was sent to Trail.

AINSWORTH.—In order to raise funds to meet pressing indebtedness, 200,000 shares of treasury stock is being offered to the shareholders of the Utica Mines, Ltd., at 10c. per share. Last year the company operated for about three months, and produced 220 tons of ore, which gave a return of 13,661 oz. of silver and 10 tons of lead.

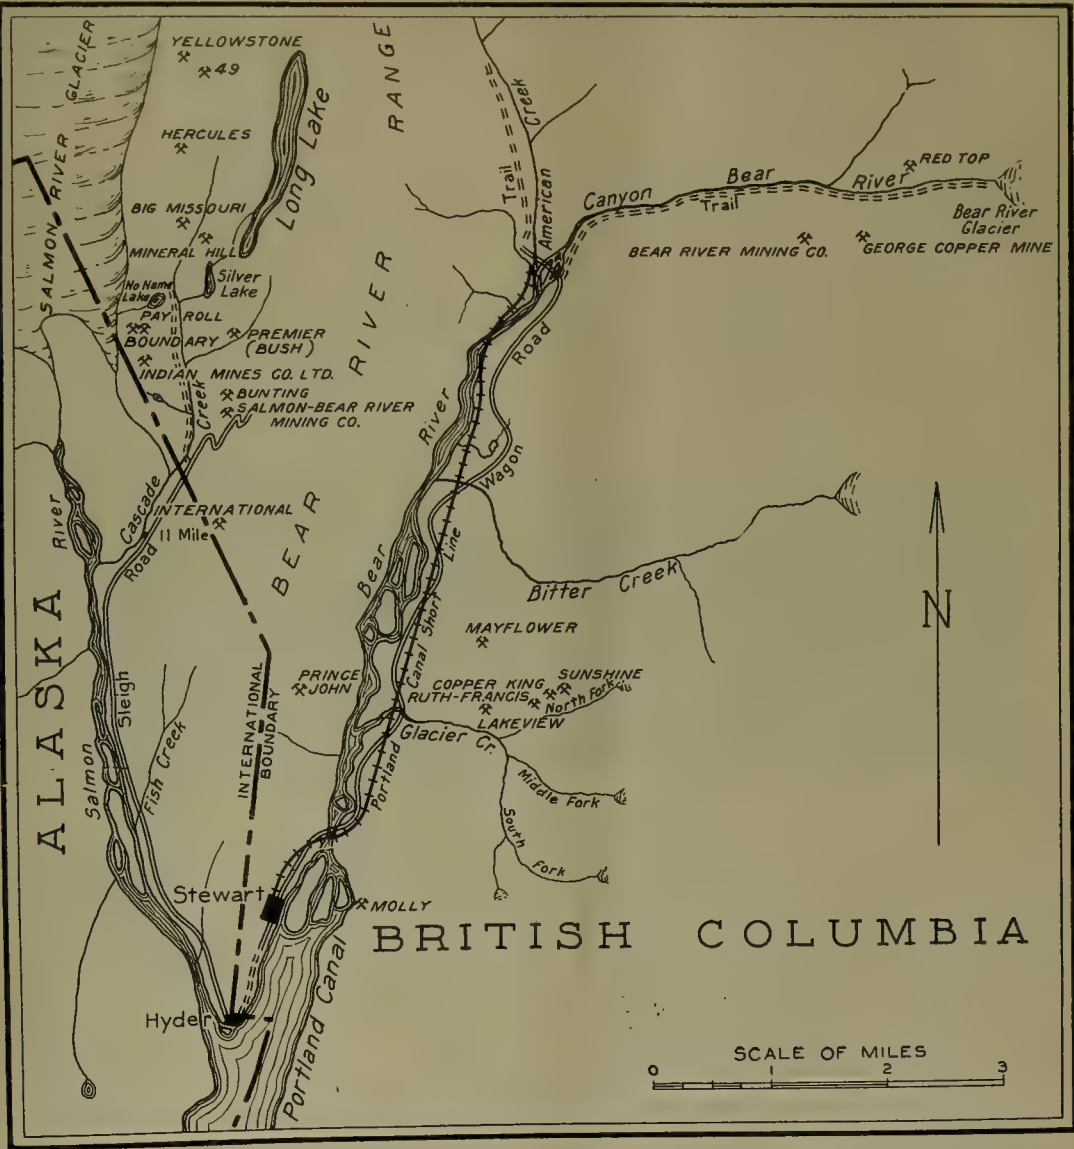

PRINCETON.—The Canada Copper corporation's new boarding-house at Allenby was destroyed by fire on November 26. The loss is \$10,000. The cause of the fire is unknown, though suspicion rests on I. W. W. strikers.

NEW HAZELTON.—The Sunrise mine has been bonded

to the Guggenheim interests. The Sunrise is situated on Nine-mile mountain, about one mile from the Silver Standard mine. A considerable amount of surface stripping has been done, exposing a number of veins, varying in size from a few inches to several feet. The mineral matter in these veins is, as a rule, fairly complex, consisting of galena, blende, gray copper, stibnite, and in

arranged and, pending the completion of the new copper mill, copper ore will be crushed at the lead mill.

Ore receipts for the week from November 15 to 21 inclusive, at the Trail smelter totaled 4648 tons, the aggregate tonnage for the year to date being 289,816. Of the independent shippers the chief were: Florence, Princess Creek, 153 tons; Josie, Rossland, 318; Mandy, Le Pas,

MAP OF THE SALMON RIVER AND PORTLAND CANAL REGIONS, BRITISH COLUMBIA

some instances molybdenite. The silver content is usually high, while sometimes appreciable quantities of gold occur.

TRAIL.—A recent fire destroyed the copper mill of the Trail smelter. The company now has the necessary repairs in hand and it is announced that the misfortune does not necessitate the suspension of copper ore shipments to Trail for treatment. The lead mill is being re-

Manitoba, 156; Paradise, Athalmer, 41; Rambler-Cariboo, Rambler, 52; Standard, Silverton, 199; Van Roi, Silverton, 41; and Whitewater, Ratallack, 40. The Centre Star mine, Rossland, was the principal shipper of the company properties with 1876 tons while the Sullivan mine, for the first time for weeks, shows a shipment of 259 tons of zinc ore.

NELSON.—Hon. John Hart, Provincial Minister of

Finance, was requested, while in Nelson recently, to submit legislation to the Provincial Legislative Assembly at its next session, providing for the amendment of the Taxation Act, in such fashion as to grant a more liberal form of relief to operators of gold mines. Under the Taxation Act of 1918 a gold mine is deemed to be a mine whose gold production amounts to 85% or more of the total value of the output. Mines coming within this classification are exempted from the 2% tax on output in recognition of the unfavorable condition of gold in the market. Representations were made to Mr. Hart that the position of gold now is more unfavorable than it was at the time of the enactment of this legislation and that the advance in silver has made it difficult for any gold property having even a very small proportion of silver in its ore to come within the 85% definition. It was stated as an example that \$17 gold ore, containing even 2½ ounces of silver at the present price, fell outside the exempted category, yet the property was essentially a gold property. It was held, as a matter of fact, that very few purely gold properties can operate under present conditions. Mr. Hart was requested to revise the definition of a 'gold property', in order that the class of mines it was originally intended to benefit might come within the classification.

The Utica mine of the Ainsworth division has not been operated for some time, but T. J. Poyntz, formerly superintendent, has not lost faith in the property. In a portion of the old workings he recently made a strike of high-grade silver-lead ore and now is sacking a quantity of the best for shipment. It is not unlikely that some action will be taken to develop this mine further. The Minister of Mines Report for 1918 shows that the Utica was operated for three months in that year, that 222 tons of ore was shipped, and that that tonnage yielded 13,661 oz. of silver and 10 tons lead.

VANCOUVER.—A company, with a capitalization of \$10,000,000, is proposed for the purpose of undertaking in British Columbia the establishment of the plant necessary to smelt and refine all the ores produced in the Province. The enterprise would involve the erection of smelters for treating copper, silver-lead, and zinc ores, producing the refined metals ready for the market, and supplying alloys of the same. It also would include the launching of a commercial iron and steel plant. It is understood that the project is to come before the Vancouver Board of Trade and that, in all probability, the Government will be asked to provide some form of encouragement and support.

The Canadian Mining Institute held its first annual meeting in Western Canada at Vancouver, B. C., from November 26 to 28. Delegates numbering over 200 represented the mining activities of the entire North-West. The program was well diversified. 'Food for thought' was there for those so inclined and entertainment was not lacking. The opening session was presided over by S. S. Fowler, of Nelson, in the absence of R. McDougall, of Nova Scotia, President of the Institute. Utilization of returned soldiers for prospecting was one of the first mat-

ters discussed, it being held that the Government, Dominion or Provincial, should employ returned men for prospecting under the guidance of experienced geologists. On Saturday morning the delegates were given an opportunity to visit the Britannia mines or the coal mines of Vancouver island, as well as several other side trips. The majority went through the Britannia, being escorted through the principal workings by a representative of the company. Quite a number, however, took the boat across the Gulf of Georgia to Nanaimo and inspected the chief producing collieries of that coalfield.

ONTARIO

DOME COMPANY FINANCES.—ELECTRIC POWER PROJECT.

PORCUPINE.—The labor situation, though showing some improvement, is far from satisfactory and the shortage of workers continues to limit the output of all the producing mines with the exception of the McIntyre, which has all the men required. The promise made last summer by J. S. Bache, president of the Dome Mines, that the company would resume dividend payments with the New Year, has been fulfilled by the announcement of a dividend of 25c. per share on January 15, which has been received with much satisfaction in financial circles, as indicating that the gold mining industry is recovering from the economic strain due to the War. During the fiscal year ended March 31, 1918, the Dome Mines operated at a loss of \$45,869, which was followed by the closing down of the mill, and when re-opened last spring it was faced by the high cost of labor and material. Matters took a favorable turn early in the summer and a considerable reduction in operating costs was effected. It is anticipated that by the close of the current fiscal year, March 31 next, the company will be able to show a surplus of approximately a million dollars. The Keora has called for tenders for sinking 250 ft. and 500 ft. of cross-cutting.

KIRKLAND LAKE.—During October the Lake Shore treated 345 tons of ore with a production of \$5565. The mine has been unwatered down to the 200-ft. level. Equipment is being installed at the Chaput-Hughes preparatory to sinking a shaft.

MATACHEWAN.—Development on the Matachewan (formerly the Otisse) is making good progress, with satisfactory results. One thousand feet of cross-cutting and drifting has been done on the first level, at a depth of 160 ft. and in addition to encountering the veins outcropping on the surface other orebodies have been found. New York interests have secured an option on the Robb-Clemens claims adjoining the Matachewan and a contract has been let for diamond-drilling. Active work has been begun in connection with the scheme for supplying Matachewan and Gowganda with electric power from Indian Chute on the Montreal river. Camps are being built, the power site cleared, and the final surveys of the falls are being made.

BOSTON CREEK.—The shaft of the Miller Independence company is down 350 ft. At a depth of about 250 ft. a new vein was encountered, which dipped out of the shaft

at 300 ft. Cross-cutting will be undertaken on the 500-ft. level. It is expected to secure electric power by about the end of the year. A steam-driven plant is being installed on the Peerless, where development work has encountered some good ore. The Allied Gold Mines are not operating at present. At the Boston-McCrea diamond-drilling has cut four veins, two of which contain some gold.

COBALT.—The part of the Chambers-Ferland purchased by the Northern Concentrator Co. consists of 25 acres lying along the east side of the railway, which still leaves the company nearly 100 acres, on which it proposes to carry out an extensive development program. Cross-cutting will be undertaken at the 425-ft. level on a conglomerate area lying between the Nipissing and La Rose properties. The Hargraves is to be re-financed by

high-grade concentrate, which is packed as far as Cumpas and hauled from there to Nacozari by wagon. The mine is operated under lease by Douglas, Arizona, people. H. W. Kaanta, mill superintendent, has just returned after making arrangements at Nogales for the delivery of the additional machinery late in December or early in January.

BUENA VISTA.—The Buena Vista mine, operated by H. J. Wendler and H. Barney, has completed its cupeling furnace and soon will be shipping its product to the refinery in the form of a high-grade silver-lead matte.

MINA MEXICO.—This property has re-opened for operation after approximately four years idleness, caused by revolutionary disturbances. Following an inspection made by E. P. Ryan, general manager of the mining interests of the Potter Palmer estate of Chicago, and C.

AN ORE-SORTING SCENE IN MEXICO

the formation of a new company capitalized at \$2,500,000. Shares of the par value of \$700,000 will be retained in the treasury. The Peterson Lake company will recommence development work as soon as unwatering, which is now in progress, will allow drilling to be done on the first level. Funds in hand are sufficient to enable work to be carried on for a year. A quantity of wall-rock left in the Seneca property when silver prices were too low for it to be profitably extracted, will be taken out. The payment by the McKinley-Darragh of a 3% dividend on January 1, calling for the disbursement of \$67,428, will bring the total returns to shareholders up to \$5,686,735, or 256% on their capital.

SONORA

RESUMPTION OF OPERATIONS.—NEW TAX ON SILVER EXPORTS.

SAN NICOLAS.—Additional thickeners and another flotation machine will be added shortly to the mill at this property, increasing its daily capacity to approximately 100 tons. At present it is handling between 50 and 60 tons of silver-lead ore daily. The company is making a

D. Cline, consulting engineer, it was decided to erect a 50-ton flotation plant. Delivery of equipment will be made shortly after the first of the year. In the meantime, pack-trains and wagons to transport the machinery to the mine, about 30 miles east of Suaqui, are being obtained. The machinery will be shipped to Nacozari by rail, and hauled by wagon or packed on mules to the property. Although it had been closed for a considerable period, the property was found to be in excellent condition and but little preparatory work underground will be necessary.

AGUA PRIETA.—A Federal decree specifying increased silver taxes, based upon the silver content of all ore or bullion presented for export at any port in Mexico, has been received here. The rate of taxation is on a sliding scale, depending upon the market price of the metal. When silver is \$1 or less per ounce, a tax of 7% is to be assessed. From \$1 to \$1.10 the tax is 8%; \$1.10 to \$1.20, 9%; \$1.20 to \$1.30, 10%; \$1.30 to \$1.40, 11%; \$1.40 and over, 12%. The rate is to be based upon New York metal quotations on the day of presentation, with the added cost

of sight exchange in New York. Another clause provides that the Government reserves the right to purchase all silver bullion presented at Mexico City, at the current New York quotation, plus 1%, less all ordinary expenses of exportation, taxes, and duties. The effect of this decree, according to silver miners, will be to lessen the mining activity in Mexico, insofar as new work or the development of new properties by foreign interests is concerned. In other words it will offset the activity occasioned by the increasingly high price of silver. The fact that the new decree increased 'overnight' the taxes on silver for export will cause foreign investors to consider long before starting any new projects which have been entertained. Such large producers as San Xavier, El Tigre, and other Sonora properties, will have to pay many thousands of dollars monthly in addition to present taxes. The mineral exports from Sonora through this port during November showed a heavy decrease from October, as a result of heavy rains which prevented transportation of ore, the Yaqui Indian trouble which kept freighters off the road early in the month, and the decrease in copper production. A total of 197 carloads of ore, or 9648 tons, valued at \$1,655,000, was exported. The properties were: Nacozari, 8910 tons; El Tigre, 549 tons; Estrella, 126 tons; Las Chispas, 36 tons; Monte Cristo and N. Potosi, 27 tons.

BELGIAN CONGO

A DESCRIPTION OF THE KATANGA COPPER PROPERTY.

Some interesting information regarding the operations of the Union Minière du Haut Katanga in the Belgian Congo was given out by H. Barzin, assistant-superintendent of mines for that company, during a recent trip to Salt Lake City. Mr. Barzin is a Belgian by birth, and a graduate of the University of Mons. He has been visiting the large copper and iron mines in Michigan, Minnesota, and Montana, and before returning to New York will visit the copper mines of Nevada, Arizona, and New Mexico.

The concession of the Union Minière, the head office of which is at Brussels, Belgium, is situated about 11 degrees south of the equator, in the south-eastern part of Belgian Congo, at an average altitude of 4200 ft. The principal town is Elizabethville, on the main line of the Cape to Cairo railroad. The trip up the Congo, by water and railroad, requires about 35 days, while to Cape Town it is a 7-day trip, the distance being approximately 3000 miles. Mr. Barzin states that this railroad has a good roadbed, and that the equipment is as modern as is found in the United States, although the running-time could be improved upon. The climate is mild and healthful, and after the underbrush and tall grass is uprooted and the land drained, fevers scarcely are known. Labor is cheap and plentiful; agitators and strikes are unknown. The natives are more interested in plentiful stores of sugar, coffee, tobacco, and food than in pay. Only a passive interest in wages is displayed. The matter of a few days delay in being paid is taken with *sangfroid*, as long as

meals are regular. Every few months the mining company sends out recruiting parties into the jungles to induce natives to enter a contract for a few months work at the mines or smelter. Compounds, consisting of a number of brick houses surrounded by a wall, are built for the accommodation of the natives. The single 'boys' have separate compounds from the married boys. Bathing-houses are provided and places for the washing and disinfection of clothes. At the mines the natives work 8 hours per day. Saturday is a half-holiday and Sunday is a day of rest, except for smelter workers. At the smelter 3500 natives are employed and at the various mines 12,000 natives are employed.

The concession of the company covers about 20,000 square miles. Outcrops of copper have been discovered in approximately two hundred different places in this area. In three of the mines now operating, the company's engineers estimate there are 25,000,000 tons of carbonate ores, of a high copper content. This estimate does not take into account the large deposits of sulphide ores of lower grade. In one mine an ore zone with a width of 4500 ft. averages 8% copper, and in this particular shale formation, shoots of copper which run as high as 15% are common. So much high-grade copper is accessible for steam-shovel mining that at present no ores containing less than 15% copper are being smelted. Lower-grade ores, which must be mined in order to move the richer ores, are piled up in the reserves, to be treated by a leaching process at a later date. At present the company is producing about 4,000,000 lb. of copper monthly, with five blast-furnaces in operation. Working at full capacity, or with seven blast-furnaces running, the smelter has a capacity of 90,000,000 lb. per year. Coke is shipped in from Rhodesia.

Mr. Barzin states that the formation is more remarkable for its extent and richness of mineralization than for any unusual geological features. In all the mines the geology is similar. A quartzite formation, from 15 to 150 ft. wide, the result of alteration of the dolomite lime, is found flanked on both sides by shale. At depth the dolomite is found. The shale carries some of the best ore; mineralization in the quartzite will run as high as 13% copper and sometimes as low as 3 or 4%. The dolomite carries the sulphides, and the shale and quartzite all carbonates. In some places a talc formation, which carries good ore, is found flanking the quartzite instead of the shale. According to Mr. Barzin, little or no overburden handicaps operations, steam-shovel mining beginning practically at the grass roots. Considerable prospecting is being done. At present the company has 24 diamond-drill outfits at work. In addition to prospecting for copper, coal is being sought and considerable development work is planned within a year upon the company's tin concession, where, Mr. Barzin said, there are enormous deposits of this metal. A short time ago drilling was begun on a spot where a low-grade ore in the quartzite was found on the surface. At a depth of 40 metres, or 125 ft., a bed 120 ft. thick, averaging 33% copper, was encountered.

ARIZONA

Crown King.—A new silver discovery has been made on the property of the Silver Crown Mining Co., one-half mile east of Crown King. The ore is 6 ft. wide, 2 ft. of it assaying 110 oz., the rest being milling ore. Thomas M. Anderson is superintendent. Development is proceeding rapidly at the Mildred, adjoining the Silver Crown on the south. Machinery has been ordered for shaft-sinking purposes. The Mildred is owned by Rosenberg & Co., of Los Angeles. North of the Silver Crown is the Lincoln, the Blue Bird, and the Swastika. Two cars of ore were shipped from the Lincoln and Blue Bird last week, by the Liberty Metallic Co. A car is being loaded now from the Union by Gemmell and Saylor. Poor roads are hindering development in all parts of the district. It is necessary to pack most of the ore and supplies on burros.

CALIFORNIA

Grass Valley.—The Idaho-Maryland Co. has installed the electric hoist formerly operated at the Union Hill and is unwatering the shaft more rapidly. The equipment formerly in commission at the El Oro group has been moved to the Central Consolidated, lately acquired by Oakland and San Francisco people. Shafts are to be sunk on the Banner and North Banner groups. John M. Nichol is superintendent.

Kennett.—Work on extensive development of the Uncle Sam mine and adjoining claims has been begun. A drift is to be driven over 4000 ft., cutting through the Alice, Snyder, Croesus, and Clipper claims. The Uncle Sam was once a famous producer of gold, but it is expected that the long drift will not only cut veins of gold ore but will go beyond into the copper-bearing territory. The work planned will take three or four years.

Masonic.—The Cook-Kibble lease on the Chemung claim of the Masonic Mines Association is shipping high-grade gold ore. A recent shipment of three tons is reported to have averaged \$50,000 per ton, making it the richest ore ever sent out from this district.

Redding.—The United States Smelting, Refining & Mining Co. and the Balaklala Copper Co. have demanded the refund of taxes from the county on the ground that the raise of over \$600,000 in assessment made by the Board of Equalization in July was "illegal and arbitrary". The first company asks for \$7520, the second for \$5391. Both claims were rejected. The copper companies announce that they will bring suits in the United States courts. Alfred Hanford, superintendent for the Atascadero Copper Co., owning the Greenhorn mines near French Gulch, has been succeeded by W. J. Weller. Hanford has gone to Montana.

Scott Bar.—The Rockberry Mining Co. has purchased San Jose ditch and water rights and plans to extend the 14-mile ditch 8 miles into the mountains, commanding waters of Kelsey, Canyon, Middle, and Thomson creeks. Work will start next season and when completed the ditch will deliver 2500 in. of water all the year to the property. The holdings cover 500 acres extending from Scott Bar to confluence of Scott and Klamath rivers. Three giants are operating. R. J. Baker is manager.

Tailorsville.—Trask & Coffey M. Co. plans to add 20 stamps to the 5-stamp mill next spring. Present development includes a 1000-ft. tunnel and drifts, and plans include a second tunnel, 100 ft. deeper, and a 100-ft. shaft; 4000 to 5000 tons of ore assaying 4% copper, 16 oz. silver, and \$2 gold is said to be exposed. G. P. Ronan is superintendent.

Yreka.—An orebody four to five feet wide has been opened in the tunnel of the Hoboken, on Cherry creek, near Yreka. The ore shows free gold and sulphides. A 30-ton Gibson mill is in operation. The lower tunnel is expected to reach the vein shortly, and a hoist has been ordered preliminary to sinking on the vein. The property is owned and operated by R. N. Diggles of Fort Jones.

IDAHO

Coeur d'Alene.—Caledonia is producing and earning about \$15,000 or \$16,000 per month, which is somewhat less than its present dividend rate of \$26,000 per month, according to Stanly A. Easton. The company has a considerable surplus and probably will continue the present rate until some time during the coming year, when it may be necessary to reduce it. Rapid progress is being made in the lower cross-cut tunnel of the Sterling Silver Mountain Mining Co., on Big creek. Specimens of native silver, taken from large pieces of float encountered in driving through the slide rock in facing up the tunnel for deep operations, are being shown.

Elmore County.—A total of \$90,000 will have been expended when the Treasure mine reaches a producing basis of 200 tons per day, part of which comes from Virginia interests. A deep tunnel will be driven to several veins containing gold-bearing ore, and the capacity of the mill will be increased. The mine is in the Rocky Bar district, home of the Elmore, Pittsburg, Goat, and other mines, credited with a yield of several million dollars in free-milling ore.

Hailey.—The Federal Mining & Smelting Co. is completing a tunnel that will connect its Independence and North Star mines. The bore penetrates a mountain and will permit the rapid delivery of ore from the Independence mine to the North Star mill.

MONTANA

Helena District.—It is estimated that about \$350,000,000 has been taken in the past from properties in this neighborhood that are now being re-opened after lying idle for a number of years. Many of the old dumps are now being sorted and shipped to the smelters. The concentrating plant of the New York-Montana Testing & Engineering Co. at Helena is now making a test-run on several cars of ore from the Jib Mining Co. of Basin. The Liverpool mine at Clancy, 13 miles south of Helena, has been unwatered to a depth of 725 ft., leaving only 25 ft. yet to be unwatered to reach the lowest level of the mine. This mine, which has been one of the largest silver producers in this district, has lain idle for 13 years. Work of taking out the water was begun on July 18 of this year. The water was lowered to the 400-ft. level by means of an air-lift, and a station pump was erected on this level. The air-lift was again used, and the water lowered to a depth of 650 ft., at which point the

lift ceased to function owing to lack of submergence. A sinking-pump was then put down and the unwatering continued. It is expected that a large amount of profitable stoping ground will be found on the 750-ft. level when the water has been lowered sufficiently.

The recently organized Montana Mining Association has opened a well equipped office in Helena, in charge of A. M. Alderson. It is expected that this association will prove of great benefit to mine operators, prospectors, and the mining industry in general throughout the State.

NEVADA

Contact.—The Gray Copper Co. reports the development of a large deposit of 4% copper ore. Some gold and silver occurs. The property has been opened by a 1400-ft. tunnel and drifts. Continued satisfactory development will be followed by the erection of a smelter, according to E. G. Gray, president of the company. C. W. Cray is superintendent.

Ruth.—Nevada Consolidated's answer in the suit brought by Minerals Separation Co. admits that the "alleged invention is of value and utility" but denies that plaintiffs have made the invention profitable to themselves and, on the contrary, alleges that "accredited representatives and agents of Minerals Separation, Ltd. (British parent concern), did on various occasions assert that the invention could not be adapted to the ores such as defendant's ores; and further that invention was developed in the United States by others, from which alleged licenses the plaintiff gathered data and useful information adapting it to the ores of the United States". The Nevada Con. states that "for a short period prior to August 31, 1917, at McGill it installed apparatus to carry on use of ore concentration by mechanical agitation but it avers that before notice was received from plaintiffs regarding said alleged infringement it had abandoned alleged infringing use and has at no time since infringed or contemplated infringement but that on the contrary all of the uses of ore concentration which it carries on at present and has since August 31, 1917, are non-infringing uses". It denies that it has copied any of the apparatus or procedure of the plaintiff. Also that Sulman, Picard, and Ballot were not the original and first inventors of any substantial and material part of the things patented, but that they had been previously invented by several others. The answer also states that the alleged invention has been successfully applied in Australia to Broken Hill ores as early as December 1904.

WASHINGTON

Northport.—The Electric Point Mining Co., operating near Northport, has declared a dividend of \$23,790. This is at the rate of 3c. per share on the issue of 793,500 shares. Payment will be made December 22. The forthcoming payment will increase the total disbursements to \$301,530, all of which were made in the last three years.—Fifty tons of clean lead ore, removed in the course of sinking, has been accumulated on the dump at the No. 2 shaft of the Gladstone Mountain Mining Co. The shaft has been sunk to a depth of 56 feet.

ONTARIO

Kirkland Lake.—The official summary of operations for the Lake Shore Mines for the month of October shows that the mine was being unwatered and the shaft and manways repaired, and the storage-bins at the mill emptied and necessary repairs started. The mill-yield was \$5565.80 from 345 tons.

CHIHUAHUA

Batopilas.—The Batopilas Mining Co. is expected to resume operations at an early date. J. R. Harbottle, general manager, has left Silver City for the mine.

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

J. H. Curle is in New York.

Charles Butters has returned from New York.

C. R. Corning has returned from Paris to New York.

R. L. Richie has returned from New York and is now at Tonopah.

C. W. Purington was in Paris recently, after his return from Siberia.

K. Byron Moore sailed for Sydney from Vancouver on December 16.

F. S. Baker, of Columbia City, Indiana, has gone to Un-sankino, Korea.

Walter M. Brown has left Searchlight, Nevada, for Long Beach, California.

A. H. Case, of the Development Company of America, is here from New York.

Ernest W. Miller, petroleum geologist of St. Louis, has just returned from the Orient.

A. P. Coleman, professor of geology at Toronto University, has been made dean of that institution.

J. B. Parker is flotation engineer with the Consolidated Interstate-Callahan Mining Co. at Wallace, Idaho.

T. M. Smither, recently demobilized from the First Engineers, has been investigating the Texan oilfields.

F. C. Riser, superintendent of the Chino Copper Co.'s concentrating plant at Hurley, New Mexico, is at Salt Lake City.

S. Hayashi, mechanical engineer at the Ashio copper mines in Japan, has been visiting mines and metallurgical plants in Utah.

Herbert W. Gepp, general manager for the Electrolytic Zinc Co. of Australasia, sailed from Vancouver on his return to Australia on November 29.

C. B. Lakenan, general manager for the Nevada Consolidated Copper Co., has returned to McGill, Nevada, after a trip to Chicago and New York.

T. H. Jenks of Phoenix, Arizona, and Los Angeles, is now engaged on professional work in New Mexico and Texas, and expects to visit Mexico shortly.

Denton Thompson, metallurgist of Salt Lake City, has accepted a position with the metallurgical department of the Kennecott Copper Corporation in Alaska.

E. J. Franklin, consulting mechanical engineer to the Ray Consolidated Copper Co. and Chino Copper Co., has been at Salt Lake City. He has returned to Hayden, Arizona.

Millard K. Shaler, of the Belgian Relief Commission, and engineer to the Congo company, is visiting his father at Portland, Oregon. He is returning shortly to Brussels.

N. O. Lawton, who has been conducting exploration work at the old Pilley's Island pyrite mine on Pilley's Island, Newfoundland, for the summer, returned to New York on December 10.

W. F. Lamoreaux, manager for the Ducktown Sulphur, Copper & Iron Co. Ltd., of Ducktown, Tennessee, was here last week to attend the funeral of his brother-in-law, the late W. H. Freeland.

D. D. Moffat, consulting engineer of mills for the Jackling porphyry properties, has returned to headquarters at Salt Lake City after an inspection trip to the Chino and Ray properties in New Mexico and Arizona.

D. C. Jackling has been awarded a Distinguished Service Medal for his services during the War, when he had charge of the construction of the enormous smokeless-powder plant at Nitro, West Virginia, which involved the expenditure of nearly \$70,000,000. Mr. Jackling has returned to San Francisco from New York.

THE METAL MARKET

| Zinc-dust, cents per pound..... | 12.50-15.00 |

EASTERN METAL MARKET

(By wire from New York)

December 9.—Copper is more active and higher. Lead is quiet and higher. Zinc is stronger.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

Eastern Metal Market

New York, December 3.

All the markets are quiet but show differences of trend; some are strong to steady and others weak.

Copper has continued to decline and the whole market is weak. This situation has also been reflected in stock-market quotations.

Heavy sales of tin have been made in a strong, quiet market.

Demand for lead is light, but prices are firm and the tone is steady.

Zinc prices are higher both here and in London and the market is quiet but strong.

Antimony is unchanged.

IRON AND STEEL

Unless the coal output can be considerably increased the steel industry will soon face serious curtailment, the shortage already shutting off production in some districts. The place of steel in the essential list will be much farther down in the scale than in the war-time heatless days of 1918. Four blast-furnaces have had to be banked by the Bethlehem Steel Co., and the Illinois Steel Co. at South Chicago has had to bank five blast-furnaces and blow out one. Most of the bar-iron and re-rolling mills in the Chicago district are idle and two iron mills at Cleveland. Pig-iron output in November made a distinct recovery from the strike conditions in October. The November total was 2,392,350 tons, or 79,745 tons per day against 1,863,558 tons in October, or 60,115 tons per day. December will probably show a considerable lapse. Furnaces in blast December 1 were 251 with a capacity of 84,550 tons per day, against only 231 on November 1, producing 65,625 tons per day. Because of the coal situation steel companies have brought their sales forces to a standstill, but demand is coming in from all directions so that business is piling up. Some companies are reaping the benefit of premium prices. Export business can have little consideration under these conditions.

COPPER

The more important producing interests continue to lower their quotations, but consumers still exhibit a decided reluctance to enter the market. Production also is considerably larger than consumption. As a result prices have again fallen. Electrolytic copper for December delivery is obtainable as low as 18.25c., New York, which we quote as the market. It could perhaps be obtained as low as 18c. in certain quarters. Lake copper is largely nominal at 18.75 to 19c., New York, for December delivery. Were it not for the value of silver many of the smaller producers could not sell copper at a profit under 21c. In general, consumption is figured as only about 50% of actual supplies, or 60,000,000 lb. per month, with production and imports totaling 120,000,000 to 130,000,000 lb. Today a better demand has started to appear with certain consumers at least inquiring for substantial quantities. It is not known at this writing whether this has resulted in much business or not.

TIN

With the exception of one day, about the middle of last week, the market has been quiet and steady. On the day referred to large sales were made for November, December, January, and February shipment from the East at prices ranging from 54.12½ to 54.50c. It is estimated that these sales aggregated at least 1000 tons. On all other days there have generally been more sellers than buyers. Spot Straits tin has sold in limited quantities at prices ranging from 54 to 54.37½c., New York, the last quotation yesterday having

been 54c. On the whole, deliveries of the metal are very good, although congestion still prevails at the docks. Because of this, deliveries into consumption in November were not as large as many had expected. The total was 6665 tons whereas not less than 7000 tons was looked for. Of this total 5600 tons is credited to Atlantic ports. The quantity in stocks and landing as at November 30 was 4955 tons, still a relatively large amount. Consumption of tin in general is better. The London market has risen rapidly—too fast to be followed by this market.

LEAD

The market has been quiet and steady but very little business has been done. Most producers have little to sell, but they seem more disposed to meet the market than they did a week ago. Some are holding at a premium above the A. S. & R. Co.'s price of 6.75c., New York. Spot lead as re-sale material has been available at 6.75c., New York, in small quantities. We quote the market firm at 6.75c., New York, and 6.55c., St. Louis, the latter being still at a slight premium over the 6.50c. quotation of the leading interest.

ZINC

Prime Western for December delivery has again gradually advanced and is today quoted at 8.10c., St. Louis, or 8.45c., New York. This is 20 points over the level a week ago. The London market is also higher. Prospects for foreign consumption are good and domestic demand is fair. Many producers are fairly well booked on orders taken in November, and are disposed to wait, but others are willing to take advantage of present levels and sell. The tone of the entire market is strong and prospects fairly good.

ANTIMONY

Wholesale lots for early delivery are quoted at 9.25c., New York, duty paid, with the market quiet and steady.

ALUMINUM

Virgin metal, 98 to 99% pure, is obtainable at 32 to 33c. per pound, New York, in wholesale lots for early delivery. Re-melt metal of the same analysis is 1c. per pound less.

ORES

Tungsten: There is little change in the general situation. Quotations are nominal at \$7 to \$12 per unit in regular concentrate, depending on the quality of the ore. It is argued by some that now is the time to buy for future consumption, as prices will more likely advance than otherwise within the next year, so that those who stock up now are likely to be in pocket at the end of a year. Ferro-tungsten is nominal at \$1 to \$1.25 per pound of contained tungsten. British ferro-tungsten has already been shipped to this country.

Molybdenum: The market is quiet with quotations nominal at 75c. per pound of MoS₂ in 90% concentrates.

Manganese-Iron Alloys: Sales of 1500 to 2000 tons of American ferro-manganese have been made at the new price of \$120, delivered. One British maker is again in the market for first quarter delivery at \$110, seaboard, and sales have been made on these terms. Spiegeleisen is active and strong at \$37 to \$45, furnace, with domestic orders good. About 4000 tons is under negotiation for foreign consumption, of which 2000 tons is for direct shipment to Germany.

Ferro-chromium: Prices are lower and the market is active. The regular alloy, 60 to 70%, is quoted at 22 to 23c. per pound of contained chromium, with the carbon range at 6 to 8% in carload lots; in less than this 1c. per pound more is asked. For 4 to 6% carbon alloy the asking price is 1c. per pound higher than the foregoing levels.

Book Reviews

Applied Science for Metal Workers. By William H. Dooley. Pp. 467, ill., index. The Ronald Press Co., New York. For sale by 'Mining and Scientific Press'. Price, \$2.

This book is designed particularly for use as a textbook in the metal-working classes of vocational high-school courses. The principal facts of elementary physics and chemistry are discussed and their application to the metal-working trades considered. The treatment is necessarily condensed, but the explanations are clear, and the book could be read and even studied with profit by many that are not high-school students.

Quantitative Analysis by Electrolysis. By Alexander Classen. Revised and enlarged translation by Wm. T. Hall. Pp. 346, ill., index. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$3.

The original edition of this book, which appeared in 1882, has been subject to frequent revision and the present volume is practically a new work. In addition to a comprehensive discussion of fundamental theories and recent developments tending to establish electro-analysis on a more scientific foundation, methods and procedure in various determinations are detailed. Part 4 gives directions for about 20 analyses which are of special practical value. The book should be of use to chemists whose work includes problems in electrolytic analysis.

Strength of Materials. By John Paul Kottcamp. Pp. 189, ill., index. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$1.50.

This is an elementary textbook requiring a knowledge of algebra and preferably of theoretical mechanics on the part of the student. The first chapter reviews the elementary principles of the latter subject, after which simple stresses are discussed. The more common materials of construction, their strength and the methods used in their manufacture are then considered. Stresses in, and the design of, beams, shafting, columns, and riveted joints are then discussed in their order. The last two chapters deal with combined stresses and resilience, and with reinforced concrete. A number of practical problems are given at the end of each chapter.

Handbook for Highway Engineers. By Wilson G. Harger and Edmund A. Bonney. Third edition. Pp. 969, ill., index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$5.

In the third edition of this useful handbook about 350 pages of new material has been added, covering particularly mountain-road location and design, camp equipment, camp hygiene and medicine, photography, special design of road-bed for moderate-traffic roads, and the more recent developments of hard-surfaced types. The general arrangement of the book is unchanged from previous editions. It is a handbook rather than a textbook, and as such will be found useful by the engineer that has to do with either highway construction or maintenance.

Foundry Practice. By R. H. Palmer. Second edition. Pp. 377, ill., index. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$3.

In preparing the second edition, the book has been revised and some new material added, principally about methods of making particular types of castings. The first part of the book deals with molding, commencing with the simpler kinds of castings and proceeding to the discussion of the more complex. There are special chapters on gates, risers, and feeding-heads. Cleaning and mending castings

are also discussed. A chapter is devoted to molding-machines. Other chapters discuss iron and its composition, the cupola, the air-furnace, the brass foundry, and foundry equipment. There is a glossary and an appendix containing mathematical and other tables. The book will be useful not only to the student and the apprentice, but also to the experienced molder.

Principles of Reinforced Concrete Construction. Third Edition. By F. E. Turneure and E. R. Maurer. Pp. 481, ill., index. John Wiley & Sons, Inc. For sale by 'Mining and Scientific Press'. Price, \$3.75.

The third edition of this standard treatise has been rearranged and considerable new material added. In particular a new chapter has been written covering the analysis of flat slabs and the chapter on building construction has been extended to include a more detailed treatment of continuous beams and girders. The chapter-headings, besides the introduction, are Properties of the Materials; Theory of Flexure of Beams; Shear and Bond Stress; Design of Beams; Deflection of Beams; Columns; Analysis of Flat Slabs; Building Construction; Arches; Retaining-Walls and Dams; Miscellaneous Structures; Reinforced Concrete Chimneys; Diagrams and Tables. An appendix contains the report of the joint committee of the various engineering societies and other interested organizations on 'Design and Working Stresses'. The book is intended as a text rather than for reference, but its use for the latter purpose would be materially facilitated by a more complete index. It will, however, be of great value to those engaged in reinforced concrete construction.

Engineering Education. Essays for English, selected and edited by Ray Palmer Baker. Pp. 185. John Wiley & Sons, New York. For sale by 'Mining and Scientific Press'. Price, \$1.25.

This attractive little book contains 14 articles, all written during the last twenty years, by authoritative exponents of literary English as applied to the expression of scientific ideas. This series of articles is meant "to present an ideal of engineering education" such as cannot be found elsewhere. Each of the seven divisions of the general subject is discussed by two distinguished men: 'The Origins of Engineering Education', by Simon Newcomb and J. J. Thomson; 'The Types of Engineering Education', by John Butler Johnson and Howard McClenahan; 'The Bases of Engineering Education', by John Lyle Harrington and Charles P. Steinmetz; 'Mathematics', by Sir William White and Arthur Ranum; 'Physics', by Matthew A. Hunter and Robert A. Millikan; 'Chemistry', by John B. C. Kershaw and Alfred Senier; 'Imagination', by Isham Randolph and Julian C. Smallwood. It will be noted that several Englishmen take part in the symposium. The book is not only a discussion of a timely and engrossing subject, but it furnishes an excellent example of style to those desirous of improving their use of the language. It is a book for thoughtful men and women.

Public Utility Rate Fixing. By C. E. Grunsky. Pp. 164, ill., index. The Technical Publishing Co., San Francisco. For sale by 'Mining and Scientific Press'. Price, \$2.50.

Questions of rate-fixing and valuation are engaging and will continue to engage the attention of many engineers. Since the question is partly an engineering and partly a legal one, there is less agreement among the authorities than if it were entirely a matter of engineering. The author of the present volume has already contributed to the literature on the subject in 'Valuation, Depreciation, and the Rate Base', and in a paper on appraisals presented before the American Society of Civil Engineers in 1912. In the latter

paper he was among the first to controvert the hitherto accepted theory that accrued depreciation should be considered in fixing rates, even though the property of the utility be maintained to give 100% service. Also in this and other writings he advocates, in the fixing of rates, the determination of a 'natural rate-base' as distinguished from fair value. The first chapter is devoted to a general discussion of rate-fixing. The second treats of special factors to be considered in determining rates, such as obsolescence, losses from fortuitous events, hazard, reward for management, unearned increment, volume of business, and going value. The point that will be found of the greatest interest by most readers is the contention that the volume of business rather than the amount invested should be the principal factor in determining reasonable profit over and above interest on investment. Valuation of real estate is then considered, and then depreciation and appreciation, the inadequacy of many of the most popular formulas being pointed out. Succeeding chapters discuss the value of a water-right, the rate of return, the rate-schedule, the public utility rate-base, and fair value and the rate-base. Many examples are given from court decisions, particularly the Spring Valley Water Co. case in San Francisco. While some valuation engineers will not agree with many of the conclusions expressed, they will all find the book to be of interest and value.

Engineering Descriptive Geometry and Drawing. By Frank W. Bartlett and Theodore W. Johnson. Pp. 577, ill., index. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press'. Price, \$5.50.

The senior author is a captain in the U. S. Navy and was formerly a professor at the Annapolis Naval Academy; the junior author is now a professor at the Academy. The book is primarily a textbook for use at the Academy; in fact, it would be difficult to use it as a textbook at any other technical school unless the courses of instruction had been modeled directly on those at Annapolis. The treatment of the various subjects has the thoroughness that we are accustomed to associate with military and naval matters. The book is divided into three parts, which are virtually independent of each other. Part I on Line-Drawing discusses thoroughly the various instruments and other equipment required in the drafting-room, together with their use. The remainder of this division of the book is devoted to ordinary lettering and line-drawing, as these subjects are taught at Annapolis. Part II, on Engineering Descriptive Geometry, discusses in an equally thorough manner the descriptive geometry of lines and plane and curved surfaces, together with isometric sketching. Part III on Engineering Drawing proceeds from the discussion of simple sketches of small machine parts to the more difficult branches of mechanical drawing, including ship lines and plate and structural-steel work. There is an appendix giving lists of standard pipe-fittings, bolts, screws, and structural material.

The Strategy of Minerals. Edited by George Otis Smith, Director of U. S. Geological Survey. Pp. 360, maps and tables. D. Appleton & Co., New York. For sale by 'Mining and Scientific Press'. Price, \$2.

This book gives emphatic point to the proposition of our national dependence upon mineral resources. This is one more of the lessons brought home to us by the War, and the thirteen chapters, by as many government officials, point out, first, the unusual requirements brought about by the War, second, the way in which these requirements were met, and third, the necessity for maintaining efficient production, with a constant recognition of the need for conservation, now that the War is over. The vital importance of

mineral supply is illustrated by Germany's ability to continue the War as long as she did, solely by virtue of her possession of the minette iron deposits. There are brief surveys of our resources in fuels, iron, copper, lead, zinc, and miscellaneous minor minerals, with some general information of a statistical character. That we are far more abundantly endowed with mineral wealth than any other country is demonstrated, and in the final chapter the editor points out the need for exceptional foresight and sagacity in organizing industry in this country. He has faith in "the scientific efficiency of the American engineer, the highly productive capacity of American labor, and the far seeing conservatism of American democracy". The book commends itself to readers of forward vision.

Pp. 321, maps, diagrams, tables. Price, \$1.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

A MOTOR-TRUCK IMPROVEMENT

Problems having to do with the use of the motor-truck in soft going, such as muddy roads in pioneer mining districts, have apparently been solved by the Fulton Motor Truck Co., Farmingdale, Long Island. This company has just announced the Fulton 'ground grippers', designed to promote the wider use of the motor-truck where the ground is muddy and impassable for trucks equipped with ordinary tires. This invention requires but little time for application to the wheels, which need not be removed when the truck passes from soft to hard ground. The 'grippers' are so placed upon the wheels that they do not come in contact with hard ground and do not injure the roads. They grip as soon as the wheels bear down into soft material.

'Ground grippers' are wide iron bands with metal flanges bolted diagonally across the outside of the band. These flanges are similar to those found on tractor wheels. They are attached to the wheel of the truck in a simple way requiring only 20 minutes to place all four bands in position for work. There are four 12-in. bolts with special wide metal bands. These bolts are at-

A Close View of the Fulton 'Ground Gripper'

Fulton 'Ground Grippers' Enabling a Fulton Truck Loaded to Full Capacity to Traverse Heavy Ground

tached to two L-shaped metal strips, which are held in position by two spokes. The bolt from these strips is attached by nut and washer to the band and quickly tightened.

Thorough tests have been made with the 'ground grippers' for some time. Their advantages for outlying mining districts are evidenced by the fact on freshly ploughed fields, one of the most troublesome types of ground a motor-truck is likely to attempt, the 'grippers' have enabled the transportation of heavy loads and have given the utmost satisfaction. Passing from the field to the road the 'grippers' are left in position, as the flanges are so placed that they clear the road-bed and cause no injury to it. If soft ground is encountered on the road the flanges immediately take hold. The accompanying illustrations show the type of ground on which motor-trucks equipped with these 'grippers' are being successfully run.

The building of the electrically-operated battleship 'California', which was recently launched at the Mare Island Navy Yard, was facilitated by the use of two ship-building cranes of the hammer-head type,

built by the McMyler-Interstate Co. of Cleveland, Ohio. The San Francisco offices of this company are in charge of L. A. Somers, who will be glad, on written request, to furnish bulletins describing these cranes and other types of cranes this company manufactures. Requests should be addressed to the company's offices, 407-409 Merchants Exchange Bldg., San Francisco.

COMMERCIAL PARAGRAPHS

'Telsmith Jaw Crushers' is the title of bulletin 264, issued by the Smith Engineering Works, Milwaukee. This bulletin describes jaw-crushers from 7 by 12 in. to 11 by 20 in., together with elevators, portable bins, and other accessory equipment.

Grubnau, Bryant & Grubnau are operating a zinc-oxide plant at Waldo, New Mexico, manufacturing zinc oxide and zinc-lead pigments for sale to the rubber industry and paint industry. They are making the finished product, put up in 10-lb. paper bags and 300-lb. barrels, according to the requirements of their customers.

The Goulds Mfg. Co., Seneca Falls, N. Y., have issued bulletin No. 122, entitled 'Centrifugal Pump Sales Service Data'. This was originally issued as a series of sales letters for use in their own organization, but the demands from outside have been so great that it has been decided to print it in their regular bulletin form. This bulletin contains a large amount of information on theory, design, testing, and many other matters connected with centrifugal pumps that have never been published before, and should be extremely useful to anyone who has occasion to purchase or operate centrifugal pumps. The company will be glad to send copies on request.

Recently there was organized in Chicago a new corporation under the laws of the State of Illinois to be known as The Booth Electric Furnace Co., with paid-up capital of \$1,000,000. Of this amount one-half is preferred stock and one-half common. The new company has acquired all the patents, assets, and good-will of the Booth-Hall Co., manufacturers of electric steel and brass-melting furnaces, and has taken over the business formerly carried on by that company. It will greatly enlarge the scope of operations, and develop the electric furnace business along standard manufacturing lines rather than on a special engineering contracting basis.

The Sierra Asbestos Co., whose mines and mill are in Nevada county, California, have made a great success in reducing the serpentine rock containing the veins of chrysotile asbestos by crushing with a 20-stamp mill and Canadian fiberizer, separating the fibres by screening and air suction. The stamp-mill puts through 100 tons of ore per day, which is to be soon increased to 200 tons per day. Trucks are now hauling the asbestos fibres of No. 1, 2, 3, and 4 grades for shipment. John D. Hoff and R. E. Conrad calculated the mining and milling possibilities of this asbestos mine. Large quantities of asbestos fibre are used for asbestos plastic flooring and asbestos stucco on the Coast.

The Allis-Chalmers Mfg. Co. has received an interesting letter from H. A. Martens, vice-president of the Mayville White Lime Works, testifying to the durability of a crusher bought from them in 1882. Mr. Martens says in part: "The old No. 5-B crusher, sold by you in 1882, is still 'on the job'. We started operation in our Richwood quarry in the month of May and we have had no repair work except re-babbitting, up to this time. It seems that the old crusher has been active in a good many quarries since 1882, but according to all appearances it has stood the knocks and hard service very satisfactorily. Judging from the condition at the present time it ought to be crushing stone for a good many years yet."

Bulletin No. 400 on the DFC oil-forge, and bulletin No. 450 on DFC melting-furnaces, are two pamphlets issued by the Denver Fire Clay Co. The first treats of an oil-forge designed for heating drill-steel, and describes in detail the burners, motor-blower, and pyrometer that are part of the equipment of the forge. The second bulletin describes the various fuels that may be used for melting-furnaces, the types of burners, tanks, and other equipment best adapted to these different fuels, and then takes up the furnaces for use with each fuel. Both bulletins are amply illustrated, and contain list-prices. They have been arranged with the idea of presenting the material in such a form that it will be of interest to all users of furnaces and forges. Copies will gladly be furnished on request to the company.

Modern industrial enterprises have expanded to such a degree that the handling of material in quantity for comparatively short distances is no longer practicable by the old wheelbarrow method. Without reference to the high cost of such outworn methods, the present labor shortage makes them almost impossible where materials must be handled on a large scale. Various automatic devices, of which the belt-conveyor, and particularly the portable belt-conveyor, is one of the chief exponents, have been coming into increasing use every year. Therefore the appearance of a carefully compiled catalogue on belt-conveyors and bucket-loaders, such as that just issued by the Barber-Greene Co., Aurora, Illinois, is always welcomed by those whose work involves the handling of large quantities of ore, coal, coke, ashes, and many other substances. This catalogue, which is known as No. 3, is a 32-page, 8½ by 11-in. booklet. It is profusely illustrated with exceptionally clear half-tones showing various types of conveyors and elevators at work under many different conditions, and accompanied by descriptive matter and tables. Emphasis is placed upon the advantages of the portable conveyor, particularly for storing bituminous coal, where there is always danger of a fire putting stationary equipment out of commission. This catalogue should be in the hands of every user or potential user of conveying machinery.

'Dependable Power' is the title of a catalogue issued by the Midwest Engine Co., Indianapolis, through its exclusive representatives, Collins & Webb, of Los Angeles and San Francisco. This catalogue describes attractively and clearly the organization, plant, and products of the Midwest Engine Co. For nearly 50 years this organization has concentrated its energies on the design and manufacture of engines. The results of this continuous effort in one field can be seen when it is stated that during the War this company sold to the United States and its Allies over 600,000 hp. of heavy-duty oil-engines, Diesel type, besides large quantities of steam-turbines, gasoline motors for artillery tractors, gasoline engines for submarine chasers, turbine-driven lighting and pumping sets, and other smaller units. The heavy-duty oil-engines are made in units from 75 hp. to 666 hp. each. With this company's broad experience as a specialist in the manufacture of engines, it is rare for any engineering problem to arise in which some member of its engineering service department has not had exhaustive personal experience. The value of this experience to its present as well as prospective clientele cannot be overestimated. It is a part of Midwest service to make, on request, an exhaustive survey of the conditions under which any prospective piece of equipment will have to operate, and to render scientific and expert judgment on the precise type of equipment that, under the determined conditions, will give maximum service at minimum first cost and minimum maintenance expense. If a client maintains an engineering department of his own, Midwest engineers are at his disposal to check his conclusions and assist in any manner found desirable.

With power interruptions eliminated by the use of electric power, production reaches new records.

Electric Hoists Are Economical and Dependable

EIGHT times as much coal is often burned to supply steam to a small steam hoist as would be necessary to supply steam, in an efficient central station, for the generation of electric power to operate the same hoist.

Piling up of cars at the foot of the hoist is almost unknown where elec-

tric hoists are used. The steady pull of the electric hoist greatly reduces the possibility of delays due to general upkeep, repairing ropes, shaft guides, etc.

Hoist operators are universally proud of their electric hoists and anxious to have them make a fine tonnage record.

General Electric
General Office **Company** Schenectady, N.Y.

AS it is so near the end of the year, we shall postpone the serial publication of Mr. Sulman's paper on flotation, in order to avoid part of it appearing in one volume and the remainder in a later volume of our own journal. The series will begin to appear in January.

CROP statistics are most favorable. Thanks largely to the increased area put under cultivation, the value of farm crops for 1919 is estimated at 14 billion dollars, which is $1\frac{1}{2}$ billions better than last year. There is need for all this supply of food, at home and abroad. We congratulate our friends the farmers, and invite them to put some of their excess profits into mining.

MOLYBDENUM is a metal that has come to the front during the War, as a factor in the manufacture of alloy-steels. We are glad to publish a thoughtful and suggestive article on this metal and its industrial uses, by Mr. W. E. Simpson, of Cobalt, Ontario. It is worthy of remark that the American Metal Company, through a subsidiary company, appears to have started a campaign of advertisement in behalf of this kind of steel, most of its full-page displays carrying the slogan, "Out of the furnace of war came molybdenum steels." The company mentioned owns, as our readers are aware, a molybdenum mine called the Climax, near Leadville, which was described in an article by Mr. L. F. S. Holland appearing in our issue of October 19, 1918.

COAL MINING in the bituminous fields has been resumed generally and the strike is declared 'off'. The President sent a 'may I not' to the leader of the strikers and he responded by promising his "sincere co-operation", but we do not like the nature of the settlement, which is temporary and fraught with further trouble. The Government, through the Fuel Administrator, decided, after careful enquiry, that conditions justified a raise of 14% in the coal workers' wages, but did not warrant any increase in the price of coal to the consumer. Mr. Garfield estimated that the 14% would meet the advance in the cost of living since the last adjustment of wages. Later the President started negotiations, through his secretary and the Attorney-General, with the leaders of the striking unions and arranged for the grant of the 14% raise, together with an agreement to submit the controversy to a commission of three, which, among other things, will decide whether an increase in the price of coal is justifiable. Thus the judg-

ment of Mr. Garfield was set aside and he was placed in a position compelling him to tender his resignation as Fuel Administrator. He will take with him the respect and gratitude of the public. It seems to us that he showed sagacity and fairness in his treatment of the big problem with which he was suddenly confronted and if he had been properly supported he could have settled it satisfactorily and definitely. Now it remains unsettled, and, what is worse, the use of threat and clamor by the unions has been permitted to prevail.

AMONG the publications announced by the University of California Press is one on the geology of the Santa Ynez district. We hope and believe that this publication is valuable, but it is evident from quotations appearing in the current press bulletin from the University that the report needs editing. For instance, we read that "although the stratigraphy of the Santa Ynez district is similar to that usually occurring throughout the California Coast ranges, a few observations of interest may be emphasized." How can a stratigraphy "occur" usually or unusually anywhere? why should the adjective of the word 'California' be ignored? and why should it be necessary to emphasize anything that the gentleman is able to render interesting; or if he emphasizes it, does it not become interesting forthwith? Indeed, why should geologists be false to their education?

ON another page we publish a letter, by an engineer unwilling to disclose his name, taking up the cudgels in defence of the War Minerals Relief Commission, and protesting against the attempts of unsuccessful producers of War minerals to make the Government pay the costs of their ventures. Our correspondent characterizes the affair as "dollar patriotism", and states, in substance, that the mines were developed and equipped as ordinary business enterprises, undertaken for profit, and that patriotism played a subordinate rôle in determining the actions of their promoters. This letter is interesting as setting forth a side of the question with which we are not at all in sympathy; so we shall demur to some of our correspondent's statements. As has been previously acknowledged, the expectation of a legitimate profit undoubtedly was a factor in motivating many of the producers; so long as men have families to support they must consider that obligation; all are not so fortunately situated as to be able to place their services and their funds gratuitously at the disposal of the Government. But

the fact that patriotism was not the only motive behind many of these enterprises seems to us beside the question. There is a clear distinction between the business enterprise undertaken solely for profit, in which the risks are carefully balanced against the expectant gain before setting to work, and the enterprise undertaken in response to the urgent appeal of the Government, when, for the avowed purpose of stimulating production, it extends certain guarantees intended to protect the promoters against risks that ordinarily would cause them to prefer some other business. For instance, one example cited by our correspondent details the experience of some miners of chrome ore, who, in November 1918, were "assured that the 1918 schedule would be continued until July 1919". That is the crux of the matter. Prospective miners of war minerals, considering the advisability of equipping properties for an uncertain life, were at the first glance obliged to face the probability of an early end to the War and a consequent disastrous break in metal prices. The prospect was not attractive. But at this stage the Government, through a well-organized publicity campaign, in the course of which it used the 'Mining and Scientific Press', advertised that the metals were urgently required and that it would protect producers to the extent of guaranteeing the market until July 1919, as our correspondent states. This assurance satisfied the operators; confident that they were protected from the loss of their market, they erected their plants and commenced production. The issue now is not how much self-interest was alloyed with their patriotism, nor how some irresponsible operators defrauded their creditors, nor how an occasional venture was profitable in spite of the collapse of the metal-market. The issue is, shall the Government redeem its pledge to the miners?

FROM Washington comes the grandiose statement that the money owed by foreign governments to the United States is equivalent to \$100 for each man, woman, and child in our country. This is misplaced emphasis. With the pound sterling at \$3.60 and the mark worth two cents, it is possible that neither the \$100 nor the interest on the \$100 will be forthcoming. When a merchant's customers are threatened with insolvency, he does not congratulate himself. That \$100 owing to each one of our own people depends for its value upon the restoration of international commerce, which is hindered by the continuation of a state of war between us and the German alliance. The drop in quotations on the New York Stock Exchange is closely related to the collapse of European exchange. The idea that the United States is an island in mid-ocean is as economically unsound as it is geographically untrue.

ANOTHER strike is over, thank Heaven. We congratulate our contemporary in New York, and the other publishers victimized by the pressmen's union, in having brought the affair to a satisfactory conclusion. It would have ended sooner if the compositors had not chosen to go on vacation. This pressmen's strike and its

sequelae are to be deplored by all those who wish labor to be justly treated, because in this case sundry unions showed themselves to be undisciplined and dishonorable. The pressmen broke the agreement of their own national organization and the compositors took concerted action to stop work without even going through the form of stating their grievance. Such performances can do no good to the cause of organized labor. Bad faith will damn any cause. If unionism is to prevail as a means for peaceable adjustment of industrial disputes, it must 'play the game'.

HUMOR is no more lacking in mining than in other human affairs. We have been privileged recently to read a report, meant to be serious, on a mine in Eldorado county, California. The writer of the report starts by stating his intention "to ascertain facts, not fancies, conditions, not theories, avoiding always the sinking shafts of the imagination into chimerical bonanzas of hope". That augurs well; but he ends by doing exactly what he set out not to do, and soon has to acknowledge that he may be charged with indulgence "in optimistic dreams or driving Utopian drifts into exhaustless pay-shoots of wealth, deep-seated but opaque". This characterization of flapdoodle is not as good as the one with which he started. Unabashed, however, he proceeds to dwell upon "the romantic, marvelous tale" of Eldorado county, where gold was first discovered in California, and to expatiate upon the early days "when every stream, every flat, every bench, and every hillside [why not say "the entire landscape"?] was literally [and apparently 'illiterately'] strewn with gold, released by ages of erosion from the gold-quartz veins and from the break-outs [what a breaking out of verbiage is here!] in the ancient channels of gravel which occupied the ridges". Then comes a description of pioneer mining, followed by a reference to the Mother Lode, thus: "The gathering of this enormous harvest of gold revealed the existence of many thousands of gold belts and districts, gold lodes and veins, of which the most remarkable, permanent [meaning 'persistent'] and greatest is the famous Mother Lode". Again, he says: "The Mother Lode is a vast system of fissure-veins with fillings of gold [as if Nature were a dentist] containing quartz, talc, lime, schist, serpentine, etc., [that "etc." saved us from the index of a treatise on petrography or mineralogy, or both] a complex of both igneous and sedimentary rocks [what is the matter with eolian formations; surely windy agencies might be dragged into the description with some appropriateness], which have undergone deep-seated dynamic and metamorphic alterations". So has the language of this gentleman's technology, which is metamorphosed English pseudomorphic after piffle. We expected the old yarn about persistence of ore in depth, and here it is: "The developments of more than 50 years have proved that, on each and every quartz vein lying in and on this central belt of the Mother Lode, those leading mines which have fortunately had the capital and the luck to be continuously worked, have never been bot-

tomed". Some of them bottomed the pockets of their owners. But Eldorado county will do even better, says our writer, presumably a 'professor' in his own right and an 'expert' in the eyes of his uncritical acquaintances. "The veins of Eldorado county," says he, "have not been any more than merely scratched, and these magnificent, powerful, potential [he throws adjectives with the lavishness of H. G. Wells] producers of enough gold bullion to liquidate the world's war-debts, now lie awaiting capital to extract their vast wealth; they rest silent, eloquent [our scribe ought to imitate them in the eloquence of their silence] implorers, alluring the attention of men of courage, men of energy, and justifiable greed of gain" and presumably, shall we say, just to alliterate, of glorious gullibility? Then come several 'conclusions', each failing to abate the flow of verbiage. Among them we find the assertion that "the pay-ores in the veins are free-milling and cannot be worked out for 4000 feet of depth in 100 stamp-mills in 50 years". Which might be true if his estimate of a cost of \$1.50 per ton could be confirmed. He attributes the idleness of the mine to "the prankish peculiarities of crank owners", and suggests that the property "is not a squeezed lemon but a virgin mine with its millions of valuable, incalculable treasures lying in Nature's safe-deposit vaults". Then, at last, comes the real conclusion, in which he states, in a grand flourish of words, that his "professional, mineralogical, geological opinion and his academic, economic, and financial view of the property is, it is phenomenal, illimitable, fascinating". All this is meant to be serious, and for that reason it is funny.

Silver

The Western miner ought to feel happy these days, for his favorite product has appreciated to a figure that is above the rate of coinage, making the metal in a dollar worth more than its face value. On November 24 silver touched \$1.37½ at New York, the official price on that day being \$1.35 per ounce. This was the highest quotation since 1872 and compares with an average price of 51.8 cents in 1915 and of 98.4 cents in 1918. Our silver coinage-rate is \$1.2929, at which figure the dollar has the same value as coin and as bullion, but our smaller silver coins contain less silver proportionately than the dollar, namely, two half-dollars, four quarters, or ten dimes contain only 347.22 grains of pure silver as against 371.25 grains in the dollar itself. Therefore whereas the parity point is reached by the dollar when silver is \$1.2929, it is not reached by the subsidiary coinage until the quotation for the metal is \$1.3828. We see therefore that on November 24 even the subsidiary coins were nearly ready for the melting-pot. Moreover, it is a curious fact that the United States differs from other countries in having no law against the melting of coins, so that if the market-value of silver bullion should remain above the coinage-rate, the melting of coins would undoubtedly follow. The reason for over-valuing the subsidiary coins, by giving them less than their face-value of silver, was because, says Mr. George E. Roberts, for-

merly Director of the Mint, they were meant to be merely token coins, purposely over-valued in order that they might not be exported or melted; but they are redeemable at the Treasury in full legal-tender money.

On November 1, 1919, the Treasury estimated that the total stock of silver dollars in this country was \$308,145,000, but of these dollars only those that have been held by the Treasury against certificates are of full weight; the others have become abraded by use, so that they would have lost a little of their original weight. However, the exportation of silver coins by private individuals is restricted by the law of April 1918 to transactions licensed by the Government, and we are informed that last week the Government stopped the export of silver from San Francisco to the Orient, then proceeding at the rate of a million dollars a day, except for the purpose of adjusting balances of exchange. The extraordinary demand of China for silver is explained largely by the fact that the War checked the normal movement of the metal to India from 1914 to 1918, and during that period the needs of India were supplied by shipments from China, which is now replenishing her reduced stocks, for which there is an enhanced demand on account of the depreciation of European paper moneys, as well as rupee notes. In 1916 the rising price induced the people of India and China to put their hoards on the market; they sold to the European governments; the price fell, until the selling stopped; the continued demand caused a rise; London was isolated by the German submarine campaign; it became cheaper to ship the metal from New York across the continent and over the Pacific to India, than through London and the Suez Canal. In this Oriental trade, San Francisco has a geographic advantage over both London and New York, therefore prices here were, and are now, at the best. Thereupon London, in behalf of the Indian government, approached Washington, and the Pittman Act followed in 1917. Silver was stabilized at 101½ cents. This permitted the United States to melt and ship 260,000,000 ounces to the Far East. The balance of trade in favor of China is causing a demand for silver, and various other factors have united in stimulating exportation of the metal to the Far East. Similarly in Europe the depreciation of paper money, the scarcity of gold, the paying of the soldiery have caused a scarcity, assisted there likewise by hoarding among the peasants. Great Britain and France have prohibited the exportation or melting of silver coins. Meanwhile production has continued to decline. In 1911 the world's output was 226,192,000 fine ounces. In 1916 it was only 156,626,000 ounces, this decrease being attributable largely to disturbed conditions in Mexico, where production fell from 70,000,000 in 1913 to 22,000,000 ounces in 1916, rising to 31,250,000 in 1917. Since then it has been increasing, thanks largely to the Real del Monte mines at Pachuca, and is now at the rate of about 45,000,000 ounces. In the United States production has decreased only slightly, in sympathy with the diminished output of copper, for 75% of our silver is a by-product from copper, lead, and gold mining. In 1918

the Anaconda copper mines, for example, yielded 10,976,905 ounces of silver.

During the year now closing there has been a notable stimulus to the mining of silver, as was to be expected. All over the West the old mines have been re-opened in the expectation of winning a profit from ore discarded in the years when silver fetched less than half its present price. In May 1919 the war-time embargo on exportation was lifted, the market was freed, although still under Government control, and silver had a chance to find its logical level. It is there now. To the miner the rise in silver is associated with the regret that the gentlemen in Mexico are so disorderly; he would like to return to the mining districts south of the Rio Grande, where he knows of hundreds of idle mines or abandoned mines that could be worked today with highly satisfactory results. To the miner the 'watchful waiting' of the Administration is most annoying; he itches to be picking and gadding in rich veins, even *hilos*, of argentite, proustite, stephanite, and all the other luscious 'ites that betoken the white metal. The Mexican dollar is at a big premium. The Mexican government is buying 50% of the mine output for its own use. The Mexican people can buy from Europe on enormously advantageous terms, placing their appreciated silver against the pitifully depreciated moneys of the old world. To be mining silver ore in Mexico would be heavenly, if only the *istas* would cease from troubling and the *revoltosos* would but be at rest.

Who Said Thrift?

Subscribers to the Hoover dinner of the Institute at New York have received a statement of accounts showing that the cost of the affair was \$11,800. Nobody, least of all the present writer, would begrudge any honor to Mr. Hoover, but it seems proper to protest against the unseemliness of spending nearly \$12,000 on a dinner to the man who worked so nobly in behalf of the famished and destitute peoples of Europe. Many members of the profession subscribed to the fund for Belgian children in 1916 on the understanding that \$12 would suffice to provide one good meal per day for one child during a whole year. Thus the banquet to their benefactor represented dinner for a thousand hungry children during an entire year. In San Francisco we heard Mr. Hoover at a dinner that cost only \$3 per cover; in New York it cost \$10. The extravagance was all the more out of keeping with the character of the guest and of the occasion, because Mr. Hoover cares little about the frills and would have been just as pleased to talk to an assemblage after a sandwich and a cup of coffee. It is curious to see such things done when the public is being bombarded by the Government with appeals to exercise thrift and buy War Savings Stamps and Treasury Savings certificates. For example, we have a circular from the War Loan Organization quoting a speech by Mr. B. F. Irvine, of Portland, in which we are told: "Expenditures are terrific. The people are on a mad financial spree. Normal business principles are dead. Thoughts of thrift are for-

gotten. A man's hat at \$20 has become a commonplace. . . . Nothing is stable. New York manufacturers and jobbers no longer quote prices of goods on future delivery. . . . The public comes along and pays whatever is asked. And so the pyramiding goes on." This is true, and it should cause all good citizens to determine to do their part in checking this orgy of spending. Unfortunately the Government itself sets a bad example. It spends its money without formulating a national budget. It threw away about four billions out of the 25 billions spent in the War. The lavish scattering of money enriched certain classes of people, from ship-workers to manufacturers, who are now spending like drunken sailors the money contributed by the citizens of this country in the form of Liberty bonds and taxes. A day of reckoning must come. The blind editor in Portland whom we have quoted says that at the age of 65, ninety-seven out of every hundred persons in America are dependent upon relatives or charity for their daily bread; fewer than 6,000,000 American families own their own homes; one person in every ten of those who die in our large cities is buried in a pauper's grave. Any poverty in this rich land is due mainly to thriftlessness; poverty means dirt, ill health, unhappiness, discontent. It is a crime against civilization that we should be spending \$12,000 on a banquet or \$20 on a man's hat when millions are suffering and dying in Europe for lack of fuel and food, and, what may be even more to the point, millions are suffering in our own land from similar causes; for the orgies of the profiteer, which includes the \$10 per day shirker in the dockyards and munition factories no less than the manufacturer and contractor at cost plus 10%, afford a violent contrast with the poverty of the school-teacher and the want of thousands of unorganized working people from New York to San Francisco. The strikes and other troubles are due in part to this exhibition of extravagance, which is bound to unsettle the minds of the uneducated. Some workmen get their \$200 or \$300 per month and buy silk shirts, gramophones, and automobiles, while others, unassisted by a truculent and irresponsible leadership, receive hardly enough to meet the cost of living, which is rising continually owing, in part, to the extravagance of the lucky ones. Educated men show no greater restraint than the uneducated; the mania for reckless spending is almost epidemic; it is worse than the intoxication caused by alcoholic liquor, for it is general among the women as among the men. The prices for women's dresses today reflect the utter unreason of the purchasers. It can end only in one way: in a collapse and a crash that will involve immeasurable unhappiness and disorganization. Just when the world at large is disorganized by the effects of the calamitous war, and when we are talking, at least, of the urgent need for the systematic reconstruction of industry in this country, there comes this mania of extravagance, rendering futile any wise measures of rehabilitation and any humane effort to settle the difficulties arising between capital and labor. It is time to pause and think seriously, lest we be caught in the reaction that assuredly is coming.

State Compensation Insurance

The Editor:

Sir—Because of your editorial comment, indicating that you are not entirely in sympathy with impressions of the State Compensation Insurance Fund given by Mr. George E. McClelland of Sonora in a letter published in your issue of November 29, I feel that in justice to your paper as well as to this Fund a reply is in order.

Mr. McClelland first refers to a Mr. Eaton, who claims to have had a "very disagreeable experience with the Bureau regarding his garage-men's insurance". A search of our files fails to reveal any record of insurance having been issued to cover anyone by the name of Eaton in a garage business. We would welcome an opportunity to answer a specific criticism with particulars.

The Mine Safety Inspectors of the Industrial Accident Commission work entirely independent of the State Compensation Insurance Fund, and we must dispute Mr. McClelland's statement that insurance could not be obtained until \$1200 had been spent for off-setting the ladder-line. It is true that we might rightfully refuse to issue insurance to any risk if we knew that the employer persisted in a failure to comply with the necessary safety rules.

Your correspondent states that he could secure no information as to how to apply for State insurance at Sonora, the county-seat. Surely he must have known that a postal card or other inquiry directed to any State Department at Sacramento would bring a reply in case he did not happen to know that the main office was at San Francisco.

The law prescribes representation of this Fund as a duty of City and County Clerks and Treasurers, but in practice this is unsatisfactory, as the duty is not welcomed by officers who have more pressing local duties to perform. We hold that the agency system is entirely unnecessary in a State where insurance is compulsory, and where that unnecessary item of overhead can be saved for policy-holders merely by the use of a postage-stamp.

Mr. McClelland's letter offers further evidence of the fact that this Fund is continually subjected to unfair competition through deliberately untruthful statements by insurance agents. I have the manual of rates before me which was followed by corporate companies under the Roseberry Law, before the State entered the business. That manual shows that the rate for compensation insurance was \$8.40. The rate established by the companies (and followed by the State) in 1914 was \$7.86. Toward the end of the first year this Fund gathered independent

statistics and adopted a rate of \$5. This action forced the companies to adopt the same rate, even though their bureau in New York insisted that it was inadequate. The rate has since been increased because of changes in the law which have added to the compensation and medical costs.

Since the rating statute was enacted which holds all insurance carriers to a certain minimum rate for each classification for protection of the solvency of insurance carriers and the ultimate protection of industrial workers, several increases in rate have been proposed by insurance companies. We have considered that the increases asked for were unjustified, and have consistently opposed their approval by the State Insurance Commissioner. While some increases have been approved by the Insurance Commissioner, he has not allowed the full increase asked by the insurance companies, and we hold that the Fund has been a consistent and material factor in keeping down the cost of compensation insurance, to say nothing of the large amounts returned to employers through dividends. These statements can be readily verified by reference to the public records, which conclusively prove that the statements which Mr. McClelland attributes to the "agent" are false.

I hardly think Mr. McClelland could have made a thorough survey of the situation in his county if he received the impression that no one in that county was insured by the State. Most all of the members of the California Metal and Mineral Producers Association are insured by this Fund, and we are carrying over 70 risks in Tuolumne county at this time, the large majority of which are mines. The latest comparative figures of the total mining business in the State, which are on file in the office of the State Insurance Commissioner, show that the total mining payroll of the State covered by insurance in 1917 was \$4,764,891, and that of this amount, this Fund, in competition with many insurance carriers, covered a mining payroll of \$3,451,128, or 72% of the total. The Fund is writing about 40% of the total compensation business in all classes, and these figures hardly bear out Mr. McClelland's belief that State insurance is not being made available and is not being taken advantage of by employers generally.

This Fund is in no way responsible for the difference in rate in California and Nevada. In the first place, it is unfair to compare rates without comparing the relative compensation costs under the two laws. In the second place, the Nevada Fund enjoys a monopoly of the business, and is not compelled to charge a 35% loading for expense in order to permit insurance companies to fairly

compete as is the case in California. It should also be borne in mind that the Nevada Fund has charged inadequate premium rates in the past and showed a deficit.

Your correspondent also shows that he does not understand the difference between a 'premium' and a 'minimum'. A minimum premium is an amount which is arbitrarily charged for a risk when the rate applied to the payroll produces a less amount than the minimum. When the State first began its competitive business with corporate companies the companies charged a \$25 minimum for ordinary risks and usually charged a minimum of \$100 upward for mines. The minimum premiums established by this Fund were very much lower and some of the companies have been forced to meet those lower minimums. These arbitrary minimum premiums are designed so that the employer with the small payroll will bear his proper share of the overhead expense. It costs practically as much to record, inspect, and audit the payrolls of the employer with a small payroll as it does in the case of the large payroll, and the minimum premium tends to equalize the contribution to the overhead expense.

For the benefit of such of your readers as may be interested, I might add that a telegraphic or mail inquiry to our main office at 525 Market St., San Francisco, is all that is necessary to bring full particulars to any employer seeking information about State insurance. We also maintain branches at Sacramento, Oakland, Fresno, Los Angeles, and San Diego.

C. W. FELLOWS, Manager.

San Francisco, December 3.

War Minerals Relief

The Editor:

Sir—Anent this much mooted question of reimbursement of those who went to more or less expense in connection with the demand for manganese, chromite, and other metals and minerals needed by our Government during the past unpleasantness, by the War Minerals Relief Commission. As an engineer, and at times a miner, and at all times a citizen striving to assist the Government and to reduce the cost of the essentials of living, I have been interested in this question and its discussion and although it may seem out of my province to attempt to judge, even for my own satisfaction, a question on which so many eminent authorities disagree, yet I would like to express to the many who did not enter the field of mining, concentrating, and shipping of these minerals during the War, my opinion in regard to some of the work done and its value to our Government and to ask some of those who are crying most loudly for reimbursement if they really, honestly, think that the Government, overburdened as it still is with war debt, should pay for their misguided errors.

Of the work done outside California in these lines, I cannot speak. Hearsay evidence is no evidence at all and I may only speak of what has come directly under my own eye and hand, so I will confine myself strictly to what I know to be facts.

For a great many years prior to the commencement of

the War, Californian chromite was mined and shipped to eastern U. S. points. Some of this mining was done by the consumers themselves. They bought or leased claims, equipped and operated them, and shipped the ore to their plants near the Atlantic coast. It is safe to assume that they would not have done this had it not been profitable. The price of chromite was much less then than it is now.

A few years before the War commenced a Californian corporation desired both chrome and manganese in connection with its operations and employed engineers to examine many of the properties offered them, opened up a few of the many that were offered, and extracted some commercial ore. The pre-war conditions demanded a much higher grade of ore than was afterward considered 'good enough' and the price offered was very low compared with prices pending during the War. Mining conditions had necessarily to be very good indeed in order to make a profit.

During the War, but prior to the actual entrance of our country into it, there was a general stampede for chrome and manganese prospects. People who never before took interest in mining began to hunt prospects and get right busy mining, sorting, and shipping. Many of them sampled (?) their own ore and shipped it and were righteously (?) indignant when the sampling at the destination showed the ore not to be as represented, and, in many cases, not of commercial value. The volume of ore which could be cheaply mined but which was not of commercial value led many to experiment with concentration of chromite ores and some of the experiments met with success.

During the period of the War before the United States actually entered it, I was called on to make some examinations of alleged chromite deposits in the vicinity of some chrome mines which had been operated for many years and were then shipping East by rail. In connection with the examinations, I looked over these operating mines as well and found that they were not cobbing the ore as closely as I should have done had I been in charge. Questions in regard to this matter brought out the fact that they frequently, when mining high-grade ore, deliberately mixed country-rock with it as they stated "to keep it slightly below \$25 per ton in value", as there was an advance in freight-rate on ore that went over this value. However, they were mining, hauling, and shipping it to the East coast at a profit.

One of the first successful attempts at concentrating chromite on a commercial scale was discussed with me before the work was started. The ore went from 10 to 20% chromite in its natural state and the promoter had pulverized and panned some of it and was confident that it would concentrate. The property was favorably located, and, against a whole lot of disinterested advice, he went ahead and built a plant which was successful and secured contracts for his product at an extremely advantageous figure. This plant, which had a capacity of 50 tons of ore per day, cost less than \$10,000 to build in its entirety. It operated during the balance of the war period and for some time thereafter to fulfil its contracts. After the

price of chrome broke and contracts were hard to get on account of the stocks on hand in the East, it shut-down; then opened up again to fill an occasional small order, and a short time ago the owner started it up to produce a few cars of concentrate for which he could get 55c. per unit f.o.b. a San Francisco Bay terminal. His concentrate averages better than 45% chromite and he is willing to make it for \$27.50 per ton delivered. A few days ago he stated that he had another inquiry for a few cars and "guessed he would go down and start up the mill as it was easy money". This was a well-advised, well-carried out, legitimate mining and concentrating proposition and its owner is not running to Uncle Sam with a tale of woe and a request for reimbursement.

In the latter part of October 1918, I was called on to go into the mountains and 'rush' the work on a milling and concentrating plant for chrome ore which was then just being started. It was completed about a month later and was run but a short time, produced a good grade of concentrate, hauling and shipping conditions were good, everything favorable, but the price had broken and only existing contracts were being carried out. These had but a short time to run. Operators however, even at this late date, were assured by telegrams from the East that the "1918 schedule would be continued until July 1919". This plant cost about \$35,000 (including the development of the mine) and I am sure of my ground when I state that the owners built it because they expected to make a profit by operating it. They were not purely patriotic, they expected prices to hold and a large profit to be made. They took a business risk; prices fell; they lost. They are making a claim against the War Minerals Relief Commission and will or will not be reimbursed. Which, I cannot say. I can state from my own knowledge, however, that a large portion of the material entering into this plant (and with many other plants the same conditions exist) was bought on open account from the merchants in the nearest town and is still unpaid for.

I recall also, at about the time this work was progressing, visiting another mill, built under most unfavorable conditions, miles from the ore it was supposed to mill and no way of getting the ore to the mill except by teams hauling over a steep, new, mountain road which became impassable after the first rains, on which a considerable portion of the labor as well as the material was unpaid and I believe is still unpaid. The workmen were duly impressed with the patriotic necessity by the promoter of the proposition and worked for weeks under bad climatic conditions only to be mulcted of their earnings. The plant never produced a car of merchantable concentrate or at least not over one car.

There are instances of the building of such mills before the alleged mines were opened up enough to show that there would be sufficient ore to keep them in operation sufficiently long to be sure that the profit from the concentrate produced would pay for the cost of the mill and the mining and milling.

I visited another mill a short time ago. It is said to have cost about \$100,000. With the exception of about

half a carload of concentrate lying on the drying-platform, there was no evidence that the mill had been run. Concentrators, etc., looked like new. I was told that there is a \$15,000 mortgage on this plant and, if this is the case, the only hope of the holder of the mortgage seems to be in the Relief Commission, as the salvage would not cover one half that amount. This is one plant for which the Relief Commission is looked to for reimbursement. I cannot state that the showing in the mine warrants a mill such as this, nor can I conceive of anyone in their sober senses placing such a mill on a chrome mine intended only to reap the harvest of war-prices. The buildings, if properly cared for and painted occasionally, would last for 50 years. Under the ore-bins are massive concrete foundations, built for all time, concrete floors in the mill-room, in the concentrator-room, concrete retaining walls of the most massive type, the whole mill built with a most lavish hand and only for a 'war baby'. Uncle Sam is expected to foot the bill.

Within a mile or two of this plant is another which cost some \$50,000 or \$60,000, possibly shipped a car or two of concentrate, and now lies idle, while there is a market for 250 to 300 tons a month of its product at a price which would make a profit and reduce the cost of the claim against Uncle Sam were the owners not more willing to sit by and await the award by the Relief Commission rather than to work out their own salvation. They believe the Government will reimburse them so why run the mill and work and worry when they are sure they will be paid back their losses without the necessity of mining, milling, and selling their product.

If this is patriotism, it is of the "dollar variety".

San Francisco, November 30.

MERCURY.

The Concentration of Platinum in Placer Mining

The Editor:

Sir—The inability of Russia to supply the increased market demand concurrent with war conditions gave increased impetus to attempts at the recovery of platinum from placer operations in the United States and Canada. The mining departments of the governments of both these countries gave liberal support to research work to foster the production of the metal. Unfortunately, an ample supply had made economic metallurgical research heretofore unprofitable, and any research had been confined chiefly to the improvement of refining methods on the crude metal and its associated metals, and what knowledge was available was scattered and fragmental.

At this time I was connected with a hydraulicking operation in a known platiniferous district of British Columbia, and gave considerable time and effort to the subject. It is with the hope that the publication of my results will lead to information being printed from others, that this necessarily curtailed summary of results is offered.

The preliminary work of testing was done with the pan and rocker. The first testing was done by rocking indi-

vidual measured cubic yards, and then panning the rocker concentrate to a bulk of one-half to three-quarters of an ounce, representing a concentration of approximately 80,000:1. An assay of this concentrate showed gold with traces of platinum.* From a suggestion made by Mr. Klink, of Shreve & Co., the next testing was carried out in the same manner, but the panning concentration was reduced only to five pounds, from one cubic yard, or a concentration of approximately 500:1. The assay of this concentrate showed a remarkable increase in both gold and platinum. By this I do not mean that the actual metal-content per half-ounce of the 500:1 concentrate was in excess of the 80,000:1 concentrate. The figures, however, when expressed in value per cubic yard, showed an average increase of 4 in gold, and an increase in the platinum from traces to an appreciable amount.

The investigation of machinery that could continuously concentrate the bank of gravel in connection with, and without impeding, hydraulic operations, led to the adoption of:

First, a set of under-current bars, 36 in. long with $\frac{1}{4}$ -in. spacing for screening the material traveling through the sluice.

Second, a hydraulic elevator for elevating the screenings to a dewatering hopper.

Third, two Neill jigs for the first step of concentrating, and handling the large capacity discharged by the elevator.

Fourth, one Overstrom Universal table to each two jigs.

With this equipment the sluice-screenings were worked, and the tailings returned by gravity to the sluice 40 ft. from where they were taken out, effecting a concentration of 150:1 on the screenings, and, based on the percentage of minus $\frac{1}{4}$ in. material per cubic yard, a concentration of 600:1 on the gravel.

The experimental equipment proved mechanically efficient. One unit, as above, turned out an average of 2000 lb. of concentrate per diem.

Contemporaneously I did some experimental work to determine the most economical method for the extraction of the valuable metals. Any known method, patented or otherwise, that came to my attention was given fair consideration, and in many cases a trial.

Flotation resulted in a simple separation of the sulphides, principally iron.

Magnetic classification yielded a gradation from clean magnetite on No. 1 magnet to clean pyritic tailings.

Electro-amalgamation proved inconclusive.

Matte-smelting apparently resulted in an incomplete extraction.

Electric smelting gave the only definite result when the concentrate was smelted in combination with either a copper or silver ore.

In ordinary laboratory assays the only consistent results were attained by the use of comparatively small quantities of litharge and silica, using equal quantities of litharge and silver chloride, heating to quiet fusion in the gas-furnace, and completing the melt in the electric furnace before pouring.

In this may be embodied the explanation of the wide variation of assay-values on so-called black sands in general; that at ordinary furnace temperatures the finely-divided metals of the platinum group form silicates with the silica in the flux that can only be broken up by the additional heat of the electric furnace. Let the experimenter who doubts this take a known weight of pulverized platinum and introduce it in an ordinary assay-charge and compare his recovered metal with the original amount.

It is with the hope that other investigators, not of the alchemistic variety, may shed more light on this interesting subject that the above is written.

Hydraulic, B. C., December 1. K. C. LAYLANDER.

Mr. Ingalls and Walkerian Economics

The Editor:

Sir—Although Mr. Brinsmade's exhaustive criticism of Mr. Ingalls' address on economics undoubtedly would be frowned down at a meeting of a dignified society or would be refused publication in the ordinary conventional periodical, on the ground that it does not stick to the rules, it makes interesting reading—as do most of Mr. Brinsmade's articles. Mr. Ingalls' economics are representative of the New Yorker who associates with financiers and high officials of industry. His pronouncements are exactly the type of philosophy that floats about Manhattan offices. Part of Mr. Brinsmade's objection to Mr. Ingalls' views undoubtedly comes from his not agreeing with this New York type of mind; and in that, of course, he voices the sentiments of many engineers in the West.

The New York business-man believes implicitly that life is strictly a survival of the fittest, as Mr. Ingalls suggests; and that no sentimentality or other nonsense should be allowed to interfere with the great law of supply and demand—in fact, that all such interference only operates to make commodities cost more to the consumer. New York business firms figure things out in hard facts, much as Germany did, and let Napoleon's "great imponderables" take care of themselves—which they occasionally proceed to do. The typical business-man neglects to notice that even in biology things do not always go according to the rules; or rather that there are other rules, such as the rule that too highly specialized and too restricted types fail and die off. Mr. Ingalls' assertion that any objections made by the people at large against the leadership of those on top reacts to the harm of the foolish ones sounds like the German dicta to the Belgians, which have now been proved to have been in bad taste.

Mr. Ingalls' address had impressed me differently from the way it impressed Mr. Brinsmade. It seemed to me a sign of a disposition at least to consider the point of view of the other fellow. At any rate it appeared to admit that there is another side to the question, which is a considerable concession, everything considered.

P. B. McDONALD.

New York University, November 11.

Short Cuts in Mine Surveying—III

By DOUGLAS WATERMAN

THE 500-FT. TAPE is of great assistance when measuring vertical shafts as well as all distances greater than 100 ft., especially when the ground is sloping. Horizontal and vertical distances between points may be obtained by measuring the inclined distance and observing the vertical angle, whereas, with the shorter tape, levels must be run to determine the difference in elevation, and the horizontal distance measured by 'breaking tape', a tedious method, and one in which the chances for error are greatly increased.

Owing to the fewer number of operations, the labor involved in carrying points down a vertical or inclined shaft is greatly lessened, and the accuracy of the survey increased by using the longer tape.

A tape of this length must be stretched tightly between points in order to eliminate the sag. This is best done by passing the tape over the right shoulder, and either taking a turn around the body with the slack, or holding it against the left side with the arm extended so that the strain will come on the shoulder and back. In this position any desired tension of the tape may be obtained.

The use of the 500-ft. tape may be easily understood by following the various steps in the operation of carrying a line down an inclined shaft. The instrument is set up over a point previously established at the collar of the shaft, in such a position that a sight may be taken down the shaft as well as a back-sight to a permanent or known point on the surface. The helper fixes a transit-point in the shaft in an advantageous position for future use, as at a station or change of angle in the shaft, which will necessitate a new set-up. If the shaft is timbered, a staple may be set in a cap, from which a plumb-line is suspended in exactly the same manner as in the survey of drifts underground.

The helper signals by waving his candle that all is ready, and illuminates the plumb-line to enable the instrument-man to turn the horizontal angle between the known point on the surface and the new point in the shaft. After turning the double angle the central wire is brought to cut a certain point on the plumb-line, which may be the point of the plumb-bob itself, a pelet of candle-grease, or a button strung on the plumb-line.

The vertical angle is read with all possible exactness, as this enters into the calculations of horizontal and vertical distance. The measurement of the slope-distance then follows. The tape is stretched as tightly as possible between the two points; that is, the point on the plumb-line from which the vertical angle was read, and the horizontal axis of the instrument.

The exact distance to the centre of the horizontal axis of the instrument is determined by the transit-man by holding the tape at this point firmly grasped between the

thumb and finger of the right hand. When the strain is released he measures with a pocket-tape from this point to the nearest footmark, and makes the necessary addition or subtraction in feet, tenths, and hundredths. Careful measurements of 'height of instrument' and of 'height of point' complete the operation.

In this connection it may be well to explain the use of the auxiliary telescope, which is employed when the inclination of the shaft is too steep to permit a sight with the main telescope. The auxiliary telescope is attached, preferably to the top of the instrument, and balanced by the counterweight furnished for that purpose. It is lined in with the main telescope by sighting on the plumb-line or the corner of a building, and thereafter is used in exactly the same manner as the main telescope. The slope-distance is measured as usual to the centre of the horizontal axis of the main telescope, while the vertical angle is measured from the axis of the auxiliary telescope. This necessitates a certain correction in the observed vertical angle as follows: The distance between the axes of the two telescopes divided by the slope-distance, equals the tangent of the angle that must be added or subtracted from the observed vertical angle before making the calculations for vertical and horizontal distance. If the vertical angle is a minus angle, the correction is made by subtracting, and if a plus angle, by adding. The distance between the axes may be measured directly on the instrument.

It often happens that while it may be necessary to use the top telescope in back-sighting up the shaft, the minus angle may be taken with the main telescope, thus avoiding the calculations just described. The procedure in such a case is to use the top telescope in turning the horizontal angle, after which the horizontal cross-wire of the main telescope is made to intersect the point, and the vertical angle read as usual.

FIELD-BOOK. Engineers' field-books are generally in blank form, the arrangement and style of headings being left to individual choice. Their use is apt to occasion a lack of uniformity in the notes if filled in by different engineers, which impairs their usefulness for purposes of reference.

The form of transit notes here presented should recommend itself to engineers, as it combines in one book a form admirably adapted for mine surveys, as well as general field-work, and covers every requirement for recording surveys above and below ground. The headings are for the most part self-explanatory, but a detailed explanation, accompanied by a few examples, will serve to emphasize their range of application.

The first column 'At Station', of course, is the point where the instrument is set up. This may be any estab-

lished station in an underground survey, any point in a traverse, or a turning-point in a series of levels.

'H. I.' as usual denotes the height of the instrument, but in mine surveys it is also used to record the distance of the axis of the instrument below a point in the roof, which would then be designated by a minus sign, or by a plus sign if the instrument sets above the point.

'Station sighted to' is used in place of 'back-sight', as this may be any point from which an angle is turned, or an elevation read; the heading is therefore more explicit in this way.

The heading 'Slope Distance' is required for underground work, although it may be used for surface-work as well where the slope is measured with the tape. This column also has the heading 'Stadia Reading', in which the reading of both wires is recorded.

The 'Vertical Angle' is recorded with the plus or minus sign as the case may be.

'Vertical Distance' is calculated. 'Horizontal Angle' (L-R), and 'Magnetic Reading' are self-explanatory.

The next column is used to record the calculated bearing as determined from the horizontal angle, or the deflected course starting from an assumed meridian, both of which are true courses or bearings, as distinguished from the magnetic bearings.

'Horizontal Distance' is either measured or calculated from the stadia reading, or from slope-distance and vertical angle.

The 'Roof to Floor Distance' will give the height of the drift that is of use in drawing cross-sections of the workings.

'Offsets left and right' are necessary where an accurate platting of the drifts or stopes (called contours by some engineers) is required.

'Height of Point' is the distance above or below the level line of sight, and is recorded plus or minus in the notes.

Under 'To Station' is recorded the station or object to which the instrument is directed and observations taken, a detailed description of which follows under 'Remarks'.

A column is provided for 'Co-ordinates' if these are used.

MINE PLANS may be platted according to the co-ordinate system, by bearings, or a combination of both methods. The courses may be referred to the true meridian, the magnetic, or an assumed meridian. The choice of the best method to adopt will usually be governed by the prospective magnitude of the mine-workings, by a consideration of possible legal difficulties, and, finally, by the system to which the engineer is accustomed.

The co-ordinate system ensures more accurate platting than can be done with the protractor, as the errors are not cumulative, but it entails more office-work. Productive mines in many districts, and especially in the United States, are so often involved in legal disputes with adjoining claims, that it is well to be prepared for such a contingency, and employ every means for producing an accurate map of the mine. More often, however, the size and importance of the property will hardly justify the

additional time expended on the calculations for co-ordinates, the platting by bearings being quite satisfactory.

It is advisable when important connections are to be made, as, for instance, with a new shaft or adit, to check the platting of the survey involved by working out the co-ordinates of the courses. Calculations of latitude and departure are also necessary when the accuracy of previous work is to be checked by a closed survey; but in general the platting by bearings will suffice.

The instrument work, as previously stated, involves the reading of the horizontal angle, from which the true course is later calculated in the office. While the reading of the needle, as a rule, will furnish a check on the calculations, it is not safe to rely upon this check when the bearing is within a few degrees of the cardinal points of the compass. For example, the true bearing might be N 2 W, while the needle might read N 2 E, there being 4° of local attraction at that particular station. The same thing might occur when the bearing is nearly due east or west. It is best therefore to check the bearing by the angle itself, which is in every case doubled, while the needle is read but once. This is done after the calculated bearings of the courses are platted on the plan and an absolute check obtained as follows: The parallel-ruler is laid parallel to the trace of the line connecting the two transit-points constituting the back-sight, and the horizontal angle, if less than 90°, laid off on the protractor, the limb of which should then coincide with the trace of the forward course on the plan. The use of the protractor in this test requires an angle less than 90°. If the angle is more than 90° and less than 180°, subtract 90 from it, and with the protractor set at this angle lay it with its base at right angles to the parallel-ruler. The limb of the protractor should then coincide with the calculated course, as by setting the protractor in this position the mechanical equivalent of subtracting 90° has been performed. If the angle is between 180° and 270°, the subtraction to be made is 180°, which again leaves an angle less than 90°. The required acute angle can be read at a glance by the following rule:

If the obtuse angle is less than 180°, add 1 to the second digit; the angle being 167°, read 77°, which is 167°-90°. For angles less than 270°, add 2 to the second digit; thus for 240°, read 60°, which is 240°-180°. For angles greater than 270°, add 3 to the second digit, but read two places only; thus as for 280°, read 10° and not 110°. This is a simple rule by which the acute angle may be determined at a glance. If the platted bearings are always checked in this manner, any mistake either in calculating the true course or in platting can be discovered instantly.

DRAWING-PAPER. The paper intended for a mine plan should be of a kind capable of withstanding the constant and hard usage to which it is sure to be subjected. There are specially prepared papers for this purpose backed with linen, which not only adds strength to the paper but prevents shrinkage in a changing climate. If the drawing is to serve as a working-plan of the mine, it is

FIG. 7

advisable to use such a paper in preference to a cheaper but less serviceable grade.

COLORING FLUIDS. It adds greatly to the intelligibility of a mine map if the various levels and workings are colored, especially if the vein has a steep pitch and the plans of successive levels cross and re-cross each other. The coloring should be done with a light wash in order not to obscure lines or lettering. Dilute colored inks will serve, but a cheaper coloring matter in the form of a powder, from which large quantities can be made, may be purchased from supply-houses. If these are not readily obtainable, the easily procured diamond dyes make an excellent coloring fluid, which by blending, will produce a great variety of colors.

SCALE OF THE PLAN. For the working-plan of the mine a scale of 30 or 40 ft. to the inch will prove satisfactory, as it falls just within the limits required for accurate plattings. Reproductions to the scale of 100 ft. to the inch are useful in supplementing monthly and other reports. A scale of 200 ft. to the inch will prove a convenient one for property and surface maps, but in this case the scale is largely determined by the scope and importance of the map.

REDUCTIONS may be made in several ways. With the aid of a pantograph a rapid reduction of a map may be made, but, as already stated, unless an expensive instrument is used, it is difficult to produce an accurate reduction. An excellent and fairly rapid method for reducing a mine-map is as follows: The compass directions having been chosen for the reduction-sheet, and the north and south line drawn, the paper is laid by the side of the larger map and oriented to correspond with its established meridian. If tracing-paper or cloth is used, it may be superimposed so that the meridians coincide. Starting from any point on the larger plan, the parallel-ruler is laid in the direction of any course that is to be transferred to the reduction. The ruler is then rolled along until it assumes a similar and parallel position on the smaller plan, and a line is traced in pencil. The distance is then scaled with the proportional dividers, previously set to the scales of the two plans, and transferred to the reduction.

If it is a succession of points or a series of courses or directions not traced on the plan that is to be transferred to the reduction, it is necessary to draw the connecting lines on the large plan as well as on the smaller, in order to identify the termination of the several measurements. An accurate reduction or enlargement may be made by this method.

Enlargements or reductions of surface-maps can be made quite easily by dividing both sheets with light lines into small squares, the size of which are in proportion to the scales of the two maps. It is then a simple matter to locate the position of roads, creeks, fences, etc., by noting their position with respect to the sides of the squares. Proportional dividers may be used to measure distances or the topography sketched in, judging relative distances with the eye.

TRACINGS, if intended for much handling, should be made on cloth, but there are excellent tracing-papers that

will serve for all other purposes. Tracing-paper is much cheaper than cloth, and in a moist climate will retain its transparency longer.

PRINTING-PAPER. Blue-print paper is much used for plans of buildings, mechanical drawings, and surface-plans. For mine-plans the black-line print is preferable to blue-print, as additions can be drawn in black lines and the print colored if desired. It has the disadvantage of being rather brittle, the process seemingly destroying the paper. Not much trouble will be experienced on this account if the print is intended for office use, but it does not stand folding and handling in the mails as well as the blue-print paper. Cloth prepared by this process is entirely satisfactory, but is rather expensive.

If the co-ordinate system is used in platting it is convenient to have the plan ruled off into squares of, say, 100 ft. on a side. If the platting is by bearings, the plan may be ruled with a few light lines parallel to the assumed meridian. These will serve as a convenient base-line when using the parallel-ruler.

On the working-plan the courses of raises and winzes are indicated by parallel lines, one solid and the other dotted, to distinguish them from drifts and cross-cuts. On the reduced plan it will be found less confusing if both lines indicating the course of raises are dotted. The survey of development work, as long as it is carried with the compass, should be traced in pencil, but it may be inked in and colored as soon as the instrument survey is completed.

A longitudinal section of the mine is as necessary as the plan. It represents a section on the plane of the vein. Some engineers prefer to consider a section parallel to the general strike of the vein, and project everything on it. This is quite satisfactory where the vein has no marked change in the direction of the strike, but in other cases it is evident that such a section would represent the length of the vein and the distances between raises as being much shorter than they actually are. This makes it difficult to measure the area of orebodies directly, and gives a false picture of the section. These difficulties can be overcome by projecting onto a plane, which, while not necessarily following all the waves in the vein, is in a general sense parallel to it.

Fig. 8 represents a plan and longitudinal section of a mine developed by means of three levels and an incline-shaft with a pitch of approximately 60°. The shaded areas of the section represent the ground already stoped, the solid black being the portion stoped since the last estimate of the ore-reserves was made.

Such a stope-map is extremely useful in supplementing the monthly or bi-monthly report. If a black-line print is taken from the tracing the ore-reserves may be colored with crayon pencils, or light coloring fluids to represent the different grades of ore. The hatched areas may represent the ore stoped prior to, let us say, the first of January, and the solid black, the ore stoped up to the date of the last report.

By taking a print of such a map with him underground, the engineer can easily find his position in any of the stopes. Moreover it enables him to record the

SECTION ON PLANE OF VEIN
Horizontally developed along the strike

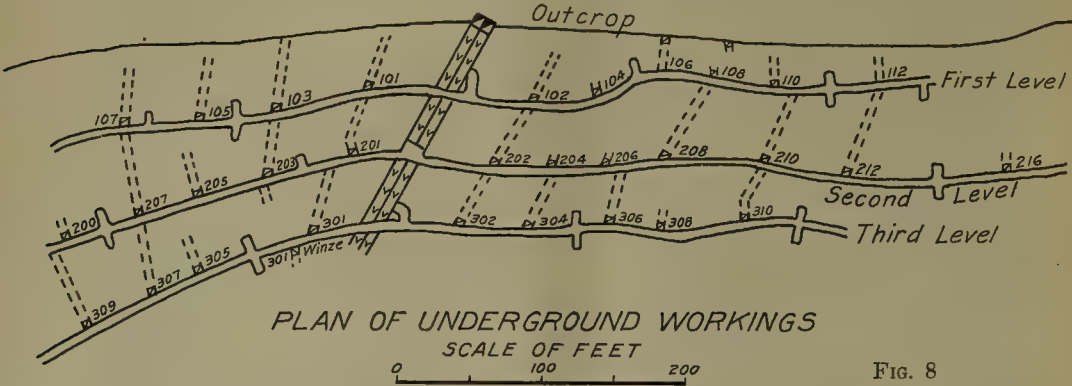

FIG. 8

FIG. 9

present outline of the stopes quite accurately. Measuring down from the level above to the roof of the stope, he scales the distance on the print and sketches in the contour of the roof over the intervening space. A record is thus obtained of the outline of the stopes drawn to the scale of the tracing, to which it may be easily transferred in either ink or pencil.

Prints are now taken for the report, or for office use. The more recent stoped areas may be indicated by a wash of india ink. The areas stoped prior to the last report, and since the first of January, will appear as solid black on the print, and the remainder in hatched lines, the ore-reserves being colored as already described. Such a stope-map gives at a glance a comprehensive idea of the condition of the mine.

Fig. 9 shows a map suitable for the purpose of illustrating a report on a mining property as yet in the early stages of development. By scaling the sectional view in the manner shown, the reader can get a better idea of relative distances on the dip and strike of the vein, and can follow with little difficulty the engineer's estimate of ore-reserves and plans for possible future development.

Ventilation at the World's Deepest Mine

In the discussion of the report of the committee on working conditions in hot and deep mines, which was presented at the meeting of the Institution of Mining Engineers held at Birmingham, England, last month, Eric Davis gave some particulars of the problem at the Morro Velho gold mine of the St. John del Rey Company, in Brazil. As is well known, this mine is the deepest in the world, the lowest working being 6400 ft. vertically below the surface and 3650 ft. below sea-level. Luckily the rate of increase of rock temperature with depth is considerably less than that indicated in the report as being usual. Whereas the report gave 1° F. for every 70 ft., at Morro Velho it is only 1° for every 140 ft., although there are indications that the rate is increasing slowly for increased depth, so that for the lowest 2100 ft. the rate has been about 1° for every 119 ft. In the year 1913 Mr. Davis was entrusted by George Chalmers, the superintendent of the mine, with an investigation into this matter with a view to overcoming the difficulties and rendering the mine workable at depths considerably greater than those that had been reached. The only instruments he had were an aneroid barometer and wet-bulb and dry-bulb thermometers. Readings were taken at every level in the mine, and the results were plotted on diagrams having depth in feet for base. It was found that the dry-bulb temperature at any one point in the mine remains practically constant all the year round, but that the wet-bulb temperature undergoes considerable variations. For the same dry-bulb temperature and barometric pressure the wet-bulb temperature depends on the moisture content, and the tests he took showed that—the conditions being equal, and the mine being a dry

one—the moisture content at any point underground, and therefore the wet-bulb temperature at that point, depends almost entirely on the moisture content of the surface air entering the downcast shaft. The whole question therefore boiled down to finding by analogy from the diagrams the volume of entrance moisture that would give wet-bulb temperatures in the working zone, below those fixed upon as the limiting value, corresponding to the 80° F. mentioned in the report. Then the temperature at which the air when saturated with moisture would have this required initial moisture content was that to which the downcast air would have to be reduced before it entered the mine. By hourly hygrometric observation at the surface, extending over a whole year, the worst conditions likely to be reached by the surface air became approximately known. Hence, knowing the volume to be dealt with, the amount of refrigeration necessary, power required, and so on, was calculated. It was found from the diagram that in order that the wet-bulb temperature in the stopes should not exceed 82°, which they had fixed upon as the maximum desirable, the initial moisture content must not be more than about 50 grains per pound of dry air, corresponding to a saturated condition at 45.5° F. The plant now being erected is capable of eliminating about 100,000 b.t.u. per minute. This corresponds to cooling the volume of air, 80,000 cu. ft. per minute, from an initial wet-bulb temperature of 72° (slightly below the maximum actual condition) to 43.5°, so that it will be on the safe side. As the surface wet-bulb temperatures varied during the year between 75° and freezing point, 32°, the refrigerating load on the plant will be a variable one. To meet these conditions the plant is being divided into six stages, each complete with its own motor-driven ammonia compressor, condenser, and evaporator. The number of sets running at one time will, of course, depend on the initial temperature. The air-cooling will be accomplished indirectly, as it would be deadly to have ammonia mixed with the entering air. Therefore the ammonia will be used to cool brine, which, in its turn, will cool the air by Heeman air-coolers. The whole plant is on the surface and deals with the downcast air before it enters the mine at all. The mine is absolutely dry, and, therefore, there is no fear of any great amount of moisture being picked up by the air in its course. The plant now being erected will cost about \$200,000; the power required is about 500 hp. Provision is made for the addition to the original six stages of three further stages in case they should go deeper and still further cooling be required. The ventilation is effected by means of exhaust fans.

THE TOLSTOI district in Alaska includes an area about 12 miles wide by 20 miles long, which lies on the flanks of Mount Hurst. Most of the district is in the basin of the Tolstoi river, on the branches of which placers that yield gold and platinum have been worked for several years. The topography, geology, climate, vegetation, and animal life of the district, the producing placers, and the economic factors that affect mining are described by G. L. Harrington in Bulletin 692-F, U. S. Geological Survey.

Reminiscences of Prichard Creek, Idaho

By ADAM AULBACH

The operations of the Yukon Gold Company's dredge are now one mile west of Murray on what is termed the Prichard Creek flat, for the gulch here is about 600 ft. wide and the width continues to the western end of the town of Murray, where it narrows considerably. This flat was heavily timbered in the early days, principally with huge cedars, which made it an ideal spot during the summer and the reverse during the usual six months of winter, when the snow on the level lay from five to eight

since become known as Eagle, the first boom camp. Prichard was the leader, but he had initiated the others to such an extent that they separated after a day in camp, Markson going up the creek about a mile, while Gelatt wandered to the place where the dredge was built, 30 years later. Here the "Old Man" found gold, according to his own statement to me, high on the rim of the gulch where the bedrock was only two feet deep. He declared he washed several pans that day, but

MURRAY, IDAHO

feet deep. The locality has considerable historic interest, for here was the scene of the dispute over the discovery of gold on Prichard creek, which electrified the country in 1883. I was on the ground in April 1884; so were the parties to the claim of discovery, A. J. Prichard and "Old Man" Gelatt. Prichard claimed to have made the discovery in 1882 in the centre of the gulch, about half a mile below Murray, where bedrock was about eight feet deep, covered densely with forest and close to the running stream. This would have made it difficult to get to bedrock to secure the gold said to have been taken out by Prichard himself. The party camped on the ground. At that time it consisted of three, Prichard, Gelatt, and Phil Markson. Two others had remained at what has

said that he went back to camp without saying anything about it. Next day he resumed work, and found coarse gold in paying quantities. He showed the gold to Prichard that evening and Prichard took it and put it into his pocket. Prichard denied this afterward and declared that he himself had taken the gold out of what he located as the discovery claim. Then Prichard took this gold and some more found elsewhere with him to the outside and shortly afterward the Coeur d'Alene placer excitement was born. I could never reconcile the two versions of the discovery.

Prichard was of a domineering temper; he had served in the Civil War, and was called Captain by his associates. His friends recognized him as the head of the prospecting

party and desired to give him credit for the discovery, even if he did not actually pan out the first gold. Therefore I gave him the honor of the discovery, although it was with some qualms of conscience. Gelatt was a man in the seventies, small of stature and of a gentle disposition; he had been a prospector since the early days of California and was about down and out. He had no desire to controvert anything that Captain Prichard claimed and was thankful to be allowed to retain the ground he had opened up as his own claim. He found that his claim covered shallow ground, but he made slow progress. The bedrock was spattered with gold and he cleaned up quite a stake, when two gentlemen named Porter and Henderson secured the claim by some process that aroused a bitter feeling among the miners in the neighborhood. Porter and Henderson took little notice of the sentiment against them; they hired a force of from 15 to 20 men and worked the ground with the utmost energy, guarding it with shotguns and rifles night and day. They cleaned up a large amount of gold, but whether Gelatt ever received any share of the output could not be learned, he being kept under close watch by Porter and Henderson. The miners in the meantime were worked up to a high pitch of excitement over what they considered a case of "jumping" and proceeded to arm themselves with what weapons they could buy or borrow, when it became suddenly known that Gelatt had disappeared, whether by his own free will or coercion was never revealed. We never heard of him again. The amount of gold taken out of the claim was not made known. Porter and Henderson worked the ground about a month after the disappearance of Gelatt and then likewise vanished. The Gelatt claim was the premier ground in the flat now being turned over by the dredge. However, the rim was the only part from which gold was recovered at that time; it was fairly coarse and well washed, being known as 'channel-run'.

The adjoining claims were a fraction owned by C. L. Jackson and Michael Melley; the O. K. claim, owned by Charles and Toft Simpson, Kid Price, and others; and the Last Chance claim, owned by Bill Stillwell and Bill Day. These claims were subsequently consolidated and patented.

The Jackson-Melley fraction has the distinction of producing the largest nugget ever found on Prichard creek. It was valued at \$270, and came from ground 12 ft. deep. Jackson died here some years ago. He was an old Californian and a typical miner. Melley is still in the flesh and a resident of Murray. The claim will be worked by the dredge during the coming year.

The O. K. claim was known as the tragic ground of Prichard creek. Early in 1884 it became the abiding-place of kindred spirits, mostly young and untamed men, who desired to pose as gun-men. What idle time they had from placer employment was devoted to revolver and rifle practice, entirely oblivious of the safety of their neighbors, or of those who passed on the trail through the timber. One of these youngsters, about 25 years old, whose name I have forgotten, except that he was called

George, became known as an expert with the revolver, not only as to marksmanship, but as to quickness and rapidity of firing. This elevated him to the leadership of the gang. When a visit was made to Murray, which was practically every evening, the town soon became aware that the gang was all there, and everybody was careful not to get mixed up with it, although the provocation was pronounced in the dancehalls and gambling-houses. The gang terrorized the town while they occupied it, and in quitting they did not steal away silently, but 'shot the place up'. Tranquility, however, followed one of these violent demonstrations. The leader was called upon to exhibit his skill with an automatic, that is, twirling the gun on his right fore-finger and firing with every revolution at some object. Five shots went all right, but the sixth sent the huge bullet into the left shoulder of George. His ascendancy was shattered; so was his shoulder in a most horrible manner. The wounded man was carried to Murray by his companions, and the following day sent East to his relatives. He never returned. The spirits of the gang shortly afterward revived and it became known as the 'Kid Price band'. This was broken up by a combination of citizens, who notified the 'Kid' and his compatriots that they had got to the end of the rope, and that there might be a jerk to it. They vanished. Peace then reigned on the O. K. claim for several months, when a message reached Murray that Charles Simpson had shot and killed Lew Wyatt. These miners, however, had no connection with the Kid Price gang. They quarreled among themselves. There was no eye-witness. Simpson claimed self-defence. He was acquitted. Considerable gold was taken out of the O. K., although bedrock was 12 ft. deep. All the gold was coarse, up to nuggets of five, six, and seven ounces. Besides gold, the dredge, in its progress just below the O. K. claim, has already caught on its riffles several pounds of big soft-nosed bullets.

The Last Chance claim, lying immediately above the Gelatt on the rim, had the distinction of yielding two different qualities of gold, one regular 'channel' and the other bright and clean 'quartz' gold, the latter predominating. It was lower in value, however, and had to be separated in part before sale. The 'quartz' gold was scattered over the bedrock as if it had dropped out of a vein close-by. Pieces of several ounces in weight were not uncommon and were highly prized as specimens, selling above their weight-value. It is believed that the dredge quite recently cut the vein from which this quartz gold came. Of course, search was made for it by tunnels in the early days, but it could not be found. More may be revealed several hundred feet farther up the gulch where a huge vein crosses and can be traced for miles north and south. Singularly, too, the southern end is in limestone, and there the ore, in small seams, runs high in silver, assays giving 150 oz. per ton and only \$15 in gold. A well-defined vein 30 ft. wide has been uncovered sufficiently to indicate its course. On the northern side of the gulch this 'ledge' has been located for three miles and gives out nothing but gold, except what silver usually

follows quartz gold. This vein unquestionably enriched Dream gulch and Missoula gulch, both of which were rich in placers; and these gulches, in turn, particularly Dream, poured out much of the gold that the dredge is now digging up. Dream gulch was also noted for its yield of nuggets and coarse gold in 1884-85. Very much later a 10-oz. nugget was taken from a shaft at the eastern end of the mouth of the gulch, and almost every nugget of any size carried the characteristic quartz of the big vein that forms the ridge between Missoula and Dream gulches.

Another historic feature of this part of Prichard creek, where the dredge is operating just now, is the Nye Pump enterprise, which was promoted by Col. Ramsey of Minnesota and H. C. Davis, assistant general passenger agent of the Northern Pacific Railroad in the latter 'eighties. It was Davis who got out and circulated the famous circular, which told the world that gold could be dug up like spuds on Prichard creek in the Coeur d'Alene mountains, near the Northern Pacific Railroad.

It had been demonstrated by the miners that no deep ground could be worked successfully on Prichard creek unless bedrock could be unwatered, and to meet this emergency Col. Ramsey contracted with the Nye Pump people of Chicago to ship one of their largest pumps to Murray and start it. It may be stated here that the pump had scored a success at Chicago in sucking sand out of Lake Michigan near Chicago in great quantities, but that was quite a different thing from the work to be done in a deep placer. This evidently was overlooked. However, an agent of the Colonel's, accompanied by his handsome wife, arrived at Murray in advance of the huge boilers and pump, with a letter of introduction to me, with the request that I locate the scene of operations on the best and most likely placer claim that could be secured for a proper test of the pump. I promptly obtained permission from the owners to locate the pump on the O. K. claim, already mentioned in this article. It was not too deep to bedrock; there was plenty of water for surface and lower operations; and there was also a fairly good chance to handle boulders with a windlass. The agent, a Mr. Argyle, a very young man and inexperienced, accepted the O. K. site and was awaiting the arrival of the machinery. One morning he called upon me and said he had concluded to give up the O. K. site and place the pump near the county road at the west side of the mouth of Dream gulch. This was done shortly afterward. When the local people woke up to the fact that the change of location had been made, there was some gnashing of teeth, but they could do nothing. The enterprise got under way and the machinery and pump worked well, until a depth of about 20 ft. was reached. Then the little side stream that had furnished the water for boilers ran dry and there was no water in the shaft for the pump. Here was a dilemma. A pump and boilers was brought to the spot at tremendous expense to unwater the mines placed high above the water-level. Relief was obtained from the California Ditch people. They laid a line of pipe from the ditch several hundred

feet distant and sold water to the pump folk, who had come with the purpose of getting rid of water, not of buying it. The work thereafter continued spasmodically until a depth of 42 ft. was attained; there they found a sloping bedrock, dry as a bone. A short drift was run before the plant was shut down by Col. Ramsey in person. He paid the bills like a good sportsman and declared he had all the placer-mining experience he wanted. The loss was said, by the Colonel to me, to be above \$40,000. The machinery reverted to Nye senior and his two sons, all mechanics.

I had satisfied myself that the Nye pump was not a failure under proper conditions and might yet succeed on Prichard creek to unwater some of the shallower ground. So I got Nye's permission to locate the pump on the O. K. claim. This was done, and a pit about 12 ft. square and 12 ft. deep was pumped out in the main channel. Boulders larger than a baseball were lifted by windlass. This was slow and expensive work. However, the water gave no trouble whatever. The pit yielded 17 oz. of gold, not half enough to pay the expense of sinking. Hence the Nye pump was added to the list of failures to wrest gold from the hard bed of Prichard creek, a feat being done so successfully by the Yukon Gold Co.'s steel dredge.

THE VALUE of tin ore produced from the tin-fields of New South Wales to the end of 1918 is \$56,022,564. The value of the output for the year 1918 was \$2,671,105, as compared with \$1,818,592 in the preceding year, thus showing an increase of \$852,513. In the Emmaville division the output was 873½ tons, valued at \$934,928, as compared with 936 tons, valued at \$688,941, in the previous year. The yield from the Tingha division was 601½ tons, valued at \$739,708, as against 600 tons, valued at \$440,676, in 1917. The output from the Wilson's Downfall division was 155 tons, valued at \$167,602, as compared with 128 tons, valued at \$84,502, in the preceding year. The yield from the Glen Innes division was 143½ tons, valued at \$152,336. In the Torrington division the production was estimated at 90 tons, valued at \$89,057. The output from the Ardlethan division was valued at \$376,584, as compared with \$302,059, in 1917. The tin ore recovered by the dredges during the year amounted to 1253 tons, valued at \$1,374,241, which was an increase of \$482,913 in value over that produced in 1917. The most successful results were secured by the plants of the Emmaville division, the output of tin recovered amounting to 504 tons, valued at \$539,598, as against 520 tons, valued at \$383,655, in 1917. In the Tingha division the output was 444 tons, valued at \$497,950, as compared with 403 tons, valued at \$294,589, in 1917. The yield from the Glen Innes division was 123 tons, valued at \$134,812, as against 132 tons, valued at \$102,673, in the year 1917. In the Wilson's Downfall division the production was 145 tons, which was valued at \$158,974, as compared with 118 tons, valued at \$78,536, for the preceding year. There were in all 50 plants in operation during the year in winning tin ore.

Molybdenum and Molybdenum Steel

By W. E. SIMPSON

According to textbooks, the principal use of molybdenum is in the manufacture of tool-steel, but current reports as to its behavior in that capacity are so much at variance with each other that some difficulty may be experienced in forming a reliable opinion as to the exact state of affairs. Claims are made that the influence of the metal upon steel is similar to and several times more active than that of tungsten, but writers declare that its high price prevents it from becoming a serious competitor to the other steel-alloys in general use.

It is quite true that during the War, when cost was of minor importance, molybdenum did enter largely into the composition of various tool-steels, but diligent inquiry leads to the belief that its use for that purpose was confined to such times as the supply of tungsten fell short of requirements, and, if one may judge from information available, considerable doubt can be entertained as to whether at any time the resulting product really proved an unqualified commercial success. The highly volatile nature of the metal, as is well known, would naturally cause a change in chemical composition at each re-heating, and, consequently, an ever increasing alteration in physical structure must eventually result in the creation of a most unsatisfactory condition of affairs. The loss by volatilization involved in converting the mineral molybdenite into the alloy ferro-molybdenum is stated to be 15% of the metallic content. This gives a rough idea of the extent of change in composition likely to happen during exposure to a high temperature. At any rate no records are available of these tools having been in general use for any great length of time and we must assume that the chief utility of molybdenum must lie in some other way than in the manufacture of tools.

Investigators of fifteen or twenty years ago were unanimous in their outspoken condemnation of the metal under any conditions as a steel-alloy, and, so far as early day experiment went, the outlook for its commercial application was decidedly discouraging. A recent repetition of these investigations, however, has shown that the undesirable qualities imparted to the steel have been due, not to the molybdenum, but to the impurities with which ferro-molybdenum was then invariably associated; in fact, the real influence of molybdenum in steel-alloys is only now just beginning to be understood and future developments are likely to be of far-reaching industrial importance.

In the early stages of the War, reports were most consistent that the great German howitzers, which battered down the supposedly impregnable forts of Liège and Namur, and which were captured when on their way for similar work near Paris, owed their quality of endurance to the presence of a lining of molybdenum-steel. The

American government, in order to test the value of these rumors, I am informed, caused chemical analyses to be made of the linings of two four-inch pieces of German field-artillery, and were unable to detect the presence of molybdenum in even the smallest traces. This is quite likely, and yet both reports may be perfectly correct. Lack of co-ordination of information in these and similar matters tends to give the impression that everything relating to molybdenum is surrounded with uncertainty from the exploration for the mineral to the marketing of the final product. Hence a situation has been created which to those interested is decidedly exasperating.

Certainly, wide experience in mine-examination work indicates that deposits of molybdenite, the chief source of molybdenum, are highly erratic both as to extent and richness, while market statistics show that the price of ferro-molybdenum has fluctuated within recent years between four dollars per pound and an offer that failed to evoke a bid.

It seems remarkable, for instance, that a comparatively large quantity of high-grade molybdenite concentrate should lie for many months at New York unsaleable and yet that there should be simultaneously, in the same city, representatives of European metal-brokers in search of quotations for the regular delivery of large quantities of this very self-same mineral. Yet it is a fact.

During the War a feeling existed among steel metallurgists of the Allied governments that the Germans possessed information regarding certain merits of molybdenum that could be turned to military advantage. Certainly statistics have shown that, in the three years preceding the War, the whole output of Queensland (Australia), then the world's greatest producer, went to Germany. The British government, therefore, as a matter of military necessity, bought every pound of molybdenite at sight, in order, not so much to use it themselves, but rather to prevent it from reaching the Germans. As a result, the price rose in Norway, on account of its geographic position, to over six dollars per pound.

Metallurgical research in England, during the War, showed that molybdenum, when added to certain steels, imparted not so much a hardening but rather a toughening property, which permitted the manufacture of plates possessed of great strength with comparatively little weight. The British War Department was not slow to realize that in this steel they had an ideal material for the construction of the famous 'tanks', and for that purpose it was used extensively, if not exclusively. It is always difficult to obtain information of a military nature but I believe that the steel plates of which the 'tanks' were manufactured contained, besides nickel and chrome, slightly in excess of one-half of 1% of molybdenum.

The alloy was so tough as to be unaffected by machine-gun fire at ten yards point-blank range.

No test could have been more severe than that to which the 'tanks' in France were subjected, and no better testimony could be desired as to the super-excellent quality of the materials of which they were constructed than the record of their performances under the most trying ordeal imaginable. Many causes are attributed to the winning of the world war, but undoubtedly the work of the 'tanks' was a highly important contributing factor and the real secret of their efficiency was the part played by molybdenum in their construction. In the United States, credible report has it that molybdenum-steel was used for making the crank shafts of the Liberty motor, as well as for other parts of aeroplane construction.

Apart from war uses, the discovery of the toughening properties of molybdenum has led to its commercial application in several industrial directions where increased strength without excessive weight are important factors. Noteworthy instances of useful application, so far as the mining industry is concerned, include such articles as cam-shafts, cams, pitmen, and all parts of mining machinery where heavy duty is demanded. The applications for patents bearing on this matter are, I believe, so numerous as to give the impression that molybdenite mining is in for a 'boom'. One specific case is that of J. W. Weitzenhorn, who was granted a patent on December 10, 1918, for an invention which "relates to alloys for structural articles made of steel" in which "elements in proportion to their weight are required to possess great strength and toughness to resist stresses of various characters". He calls attention to the fact that with the usual steel-alloys from which articles are manufactured, if high ultimate strength and high elastic limits are desired, the effect of the necessary heat-treatment is to cause them to become hard and brittle. On the other hand, if toughness is required, then that quality is commonly "attained at a very substantial sacrifice of strength". According to the claim of the patentee, a most desirable combination of toughness and strength is secured with a steel alloy containing "about 0.35% carbon, 1% chromium, 0.15% vanadium, and from about 0.75% to 1% molybdenum".

It is common knowledge that the crank-shafts and many other parts of aeroplanes are made of molybdenum-steel but its greatest use in the immediate future seems to be in the manufacture of steel for auto-trucks, tractors, and automobiles. In this connection much credit is due to the industrial research-work of Child Harold Wills, so long associated with Henry Ford. He has been granted patents under dates of September 3 and of December 17, 1918, for certain steel-alloys in which molybdenum is the all-important factor. In his specifications Mr. Wills states that, "It has been impossible to obtain the super-excellent qualities of certain special steels without losing other properties absolutely essential to a commercial steel." He classes the various well-known alloys of steel for their defects and disadvantages: vanadium for "its liability to crystallization above certain narrow temper-

ature ranges"; nickel "although having non-crystallizing characteristics superior to those of vanadium steel, is very hard to machine after heat-treatment"; manganese-steels while possessing "super excellent properties, such, for example, as exceedingly high tensile strength and high elastic limit—are unworkable and most difficult, if not impossible to machine"; and chrome falls short in some respects "particularly as to crystallization and narrow range of heat-treatment".

Mr. Wills then goes on to say, "It is the purpose of my present invention to provide a commercial alloy-steel which at the same time has the super-excellent qualities of certain of the special steels and retains all the other characteristics necessary to bring the steel within the commercial class." Then he states:

"I accomplish the foregoing by the use of molybdenum as an added constituent to alloy-steels in fractional percentages ranging substantially from between 0% to 1% or a little higher."

Then follows a detail of experimental tests "which are fully supported in actual commercial developments".

Thousands of test automobiles have now been manufactured of molybdenum-steel and given the severest commercial usage with eminently satisfactory results. Accurate statistics have been taken of miles negotiated per gallon of gasoline, tire-life, oil-consumption, etc., and the particulars, I believe, are cause for much enthusiasm. The year 1920, according to current reports, should see the introduction to the public of the molybdenum-steel car, the superiority of which, it seems, has now been thoroughly demonstrated.

As regards details of automobile construction, I am credibly informed that an axle of molybdenum-steel has been twisted cold six times completely without showing signs of fracture. I do not know how far apart from each other were the twisting vises, as that would have some influence on the value of the test; for if these were close to each other, the pressure of the jaws would naturally tend to prevent any signs of fracture from showing, but, in any case, in this matter, confirmation is given to the assertion that the presence of a small quantity of molybdenum in steel undoubtedly does furnish a degree of uniform toughness that is truly remarkable.

Apart from use in the manufacture of aeroplanes and automobiles for which a steady demand can be confidently predicted, it seems to me that the scope of molybdenum-steel will be extended in degree to all other steel-consuming industries, although I am not prepared to endorse the opinion of some optimists who look to it replacing, to some extent, the other well established steel-alloys, such as nickel. Even if further metallurgical research were to hold out the hope of such a possibility, its realization is unlikely, if for no other reason than that an adequate supply is not available. "The future of molybdenum," said a British steel expert to me a few weeks ago, "depends on two factors, namely, assurance of supply and price."

As to supply, no molybdenite property at present known can offer, say, 50 tons per month, whereas the

FROM OUR OWN CORRESPONDENTS IN THE FIELD

ARIZONA

DEVELOPMENT BY HILL TOP METALS MINING CO.—NOVEMBER
SMELTER OUTPUT.

HILL TOP.—The Hill Top Metals Mining Co., owning a property in the California mining district, near Paradise, Cochise county, plans during the coming year to build a 200-ton unit to its silver-lead smelter. Effort is being directed toward inducing either the El Paso & Southwestern or the Southern Pacific to build a branch line to the property, according to J. O. Fife, president of the company. Mr. Fife said he had taken the matter of railroad building up with the El Paso & Southwestern, but, while the matter seemed to receive favorable attention, shortage of rails and ties would prevent plans from being carried out in the immediate future. The Hill Top mine has been worked for six years and in a series of tunnels extending through the Chiricahua mountains has opened up big bodies of silver-lead carbonates. Every element of a perfect furnace charge, except coke, exists on the property. Considerable bodies of copper ore also have been opened, but it is proposed to ship this class of ore, making no attempt to smelt it. It has been estimated that there are blocked out and ready to be broken 1,000,000 tons of ore which will average better than \$30 per ton. Mr. Fife predicts that when the property is placed on a producing basis it will be in position to maintain normal production for fifty years without interruption. Owing to development by tunneling, the most economical methods of extracting ores by underhand stoping will be possible. Two tunnels extend entirely through Chiricahua range, affording the property an outlet either to the E. P. & S. W. or to the Southern Pacific railroad. The mechanical equipment is excellent. Owing to a cracked cylinder-head in the Diesel engine the property was inoperative for several weeks, but repairs have been made and normal work resumed. R. O. Fife is managing director and mining superintendent. L. D. Huntoon, formerly professor of the geological department of Yale, and Charles Berkey, of Columbia University, have arrived at Hill Top and will be engaged in completing a joint geological survey of the Hill Top Metals Mining Co. and the adjoining Hill Top Extension Mining Co.'s properties. The latter concern, which is owned in Douglas, has developed good orebodies and has an encouraging outlook. John Blumberg is manager.

TUCSON.—W. B. Thompson, who was here recently in course of inspection of his interests in Arizona, sees hope

in the copper situation, even though a portion of the stock held at the beginning of 1919 remains unsold. Domestic consumption, he declared, was the greatest in the history of the country. Colonel Thompson visited the Three R mine, recently acquired by the Magna interests, at Patagonia, and expressed the opinion that it had potentialities as a great mine, though much development would be necessary.

PHOENIX.—The sixth annual meeting of the Arizona chapter of the American Mining Congress was held here December 8, with many delegates present to discuss problems of the industry. Officers for the ensuing year were elected. They were: Norman Carmichael of Clifton, re-elected governor; G. M. Colvocoresses, Humboldt, first vice-governor; F. W. MacMennan, Miami, second vice-governor; John C. Greenway, Warren, third vice-governor; H. J. McClung, Phoenix, re-elected treasurer. In the directorate W. F. Boyd of Ray succeeded L. S. Cates, and F. W. MacMennan of Miami succeeded R. Britton Gottsberger.

DOUGLAS.—November smelter output here was not much below that of October. The Copper Queen smelter produced 8,800,000 lb. of copper, but steps have been taken to reduce the December production to 7,500,000. Calumet & Arizona produced 6,338,740 lb. It is known that considerable reduction is planned for December. Tests of equipment of the new transmission line between the Copper Queen smelter and the Warren district have been made. Large transformers and waste-heat boilers, served by the reverberatory furnaces of the plant, have been installed to produce the current for the line. At the C. & A. smelter a peculiar happening has caused a crew of men to be set at work wrecking the upper half of the 300-ft. fume stack at the roaster-plant. In some manner the stack was dented at a point 150 ft. above the bottom. Recently, during the heavy rains which have marked the fall season, moisture collecting at this point formed sulphuric acid which ate through the plate at the dent, and made immediate repairs necessary. The top half is being taken down, section by section, but will be re-built as soon as the damaged plate can be replaced. A temporary stack has been erected to carry off the fumes while work is in progress.

HUMBOLDT.—The Consolidated Arizona Smelting Co. reports that during November the company's Blue Bell and De Soto mines made shipment to the smelter of 12,100 tons of ore. The concentrator handled 8500 tons

of material while the smelter treated 7400 tons of metal-bearing ores and concentrates. The shipments of fine copper bullion to Eastern refineries amounted to 670,000 lb., of which over 500,000 was derived from ores mined on the company's own properties.

CALIFORNIA

NEW OPERATIONS STARTED.

GRASS VALLEY.—A 7-ft. vein containing free gold has been uncovered on the Mulcahy ranch near Newtown and the ranch has been bonded by T. A. Gill and I. E. King of Grass Valley and Lester M. Dull of Pasadena. The bonders have started a shaft and also are engaged in trenching the vein.

NEVADA COUNTY.—William Buchholz bid in the Black Bear mine in the Rough and Ready district, November 30. The bid, \$24,400, covers the judgment, interest, and costs.

Charles and A. J. Kistle purchased the 5-stamp mill at the Black Bear mine and have about completed its erection near the old Lincoln mine on Little Deer creek a short distance east of Nevada City. The mill will be operated by water-power.

John C. Donnelly purchased a roller gravel mill in Plumas county recently and moved it to the Kirkpatrick mine near Forest. The mill has a capacity of 140 tons per day and will be used in addition to the present plant. A quit-claim deed from Warren Delano of Red Hook, New York, to Frank E. Bradley of Derby, Connecticut, to the New Blue Point gravel mine near Smartsville, has been placed upon record. The mine has been famous as a producer and has changed hands many times since it was owned and operated by the late 'Paddy' Campbell. The property is involved in litigation.

SIERRA COUNTY.—The present workings in the Oro mine near Downieville have been following a 5-ft. vein heavily mineralized and containing free gold. G. P. Reynolds and others of Alameda are operating the property on a bond.

The development work done on the Comet quartz mine near Downieville the past season by the Gold Exploration Co. has been satisfactory. One drift has shown the vein to be 65 ft. wide. This ore contains sulphides and free gold. From present indications the company has pay-ore ready for extraction and treatment. F. O. Richardson is general manager.

REDDING.—The Bully Hill Mines Co. at Winthrop has reduced its force from sixty to twenty men. Enough ore being blocked out for fifteen years, it was decided to stop development work until the first unit of the reduction works is in operation. Construction work will be begun in thirty or forty days and the initial unit should be completed in three or four months. Four units are contemplated.

PLUMAS COUNTY.—The Gruss Mining Co. has completed preliminary work for active driving of a 1000-ft. working-tunnel. The mill is to be remodeled and enlarged during the winter months.

COLORADO

CURTAILED PRODUCTION DUE TO COAL SHORTAGE.

CRIPPLE CREEK.—The output of the Cripple Creek district for November is estimated at approximately 33,182 tons with a gross bullion value of \$292,738. Plants which were down on account of coal shortage are now operating at capacity and the December record, unless another shut-down is found necessary, will be good. The lease of Anderson and Benkelman on the Trail mine of the United Gold Mines Co. expires on January 1. Work is being rushed and in three days of the past week, shipments of ore netted the lessees \$8000 after payment of transportation and treatment. The ore shipped was from the bottom or 1400-ft. level of the Dexter shaft, and averaged better than 3 oz. gold per ton. If no renewal is granted, the company will start work on high-grade ore. A dividend of one cent on the 4,000,000 shares of outstanding stock has been declared by the United Gold Mines Co., payable December 20, to stockholders of record on December 10.

Operations have been resumed by the El Paso Extension Corporation and its lessees on the Index mine and Lexington properties on Gold Hill after a shut-down due to coal shortage.

A. E. Carlton, president of the Cresson Consolidated company, in his annual report says: "During the year 94,920 tons of ore were shipped. The net return was \$1,039,500, giving the ore a net value of \$10.95 per ton. The company received as additional income the sum of \$1438 in royalties from 864 tons of ore shipped by lessees, and also \$12,208 as interest on deposits, making a total of \$1,053,156. The total cost per ton of ore produced was \$4.30. Dividends of 10c. per share per month were paid during the year, or a total distribution of \$1,464,000; total to date being \$8,491,162.

"Development work during the past six months has been almost discontinued on account of labor conditions. This development is essential, for upon the results depends the opening of new high-grade ore and also maintaining our ore-reserves."

TELLURIDE.—Production is very much curtailed, as the Tomboy output has been temporarily stopped, due to changes being made in the milling process. The Smuggler Union Mining Co. has also been making some minor changes in milling operations which have had a like effect. The shortage of railroad cars continues. New generators have been installed at the Bullion tunnel by the Smuggler Union company.

OPHIR.—The Ruutilla & Brown Leasing Co. is getting out ore from the Carbonero that carries about 45% lead, in addition to other metals. Mr. Ruutilla has leased the Favorite mine, formerly operated by Andrew Matson, and will develop and ship from this property in addition to operating the Carbonero. The Delta tunnel is to be driven to the Success vein of the Mountain Flower group. Work will be continued during the winter. The construction work at the San Bernardo mine, under lease to the Valley View Leasing Co., is progressing satisfactorily,

although difficulty is being experienced in excavating. The compressor house, blacksmith shop, and transformer house are completed.

SILVERTON.—The Sunnyside M. & M. Co. is getting under way for a busy season. The rise in lead price offers additional encouragement, and the force of men is being increased from 150 to 300. All the ore-bins are filled, and the mill will be started at an early date. The Iowa Tiger Mining Co. has changed its name to Southwestern Mining Co. All operations are to be confined to the Iowa Gold property, and production from this property will probably be doubled, as the operations on the Mayflower have been abandoned, and the mill will run on Iowa ore exclusively.

RED MOUNTAIN.—The Red Mountain Mines Co. con-

ROUND TIMBERS IN A SQUARE-SET STOPE, BUTTE, MONTANA

tinues to run its mill, in addition to making shipments of crude ore. The Mammoth tunnel is reported to be in, a distance of 2250 feet.

RICO.—Work on the Expectation group has been discontinued by the owner, Charles Engle, owing to the depth of the snow. A large body of high-grade copper ore has been opened up, and development will be resumed at an early date next spring.

PARADOX VALLEY.—The Colorado Vanadium Co.'s mill was tried out on November 19, and after a few adjustments the mill operated smoothly. Three shifts are now working.

OURAY.—The Silver City Mining Co. is developing its property with a view to heavy production during the coming season. Construction work is now under way with a force of 25 men, building a boarding and bunk-house that will accommodate eighty men. A compressor-house, sawmill, and power plant are to be built. A tunnel is to be driven under the old tunnel-site to cut the vein at a greater depth. J. H. White is superintendent.

MICHIGAN

MASS CONSOLIDATED SUSPENDS OPERATIONS.

The present year will see the completion of the Calumet & Hecla's great underground haulageway, connecting the South Hecla with the Red Jacket perpendicular shaft. This connection runs through the Calumet amygdaloid vein at a point 180 ft. below the conglomerate. From this main cross-cut is a drift connecting with each of the operating shafts. Ultimate plans for development at extreme depth centre about this work, so that its completion is expected to mark the opening of a new era in the story of the Calumet conglomerate lode.

Mass Consolidated company has suspended mining operations to be resumed only when conditions become normal. The company has been operating at a loss, and the management does not believe the shareholders of the company desire to exhaust the capital resources with unprofitable operations. The company has 1,250,000 lb. of unsold copper on hand.

The general physical condition of the mine never looked better than it does at the present time, practically all of the underground workings being in good copper ore. The Mass management attributes its suspension to the fact that the miners simply will not do a fair day's work.

Victoria produced 108,000 lb. of ingot copper at the rate of 16 lb. per ton in November. Tonnage was 6750. Comparison shows betterment in quality, but falling off in tonnage.

MONTANA

ANACONDA MINES SHUT-DOWN.

BUTTE.—Owing to the coal strike the mines of the Anaconda Copper Co. have been closed down. Both copper and zinc producers are included, making the most complete shut-down ever seen at Butte. The pumps have been pulled, and the levels below the 2800 of the High Ore mine are filling with water. All water above the 2800 is pumped by electricity at the High Ore pumping plant. Some of the hoisting engineers are being laid off and the engine-room windows and doors are being boarded up, the foreman and watchmen in some instances being the only men retained. While the W. A. Clark zinc and silver mines and the Butte & Superior mine and mills are still working, they may be forced to close at any time. The East Butte company reports about one week's coal supply, and the Davis-Daly's Colorado mine is still operating.

The Hayden-Stone interests have secured an option, or lease and bond on the Otesco group and a large block of surrounding territory. A complete electric surface plant is being erected to sink the Otesco shaft to the 2000-ft. level where exploration will be carried out. A 4-in. air-line has been laid to the Heaney shaft, which is likewise being equipped for a development campaign. This ground is two to three thousand feet south of the Davis-Daly and about the same distance south of the Anaconda company's Belmont mine. The Tuolumne

Copper Co. has picked up the ore-shoot on the 1000-ft. level of the Sinbad shaft by cutting through a local fault. This is presumed to be the downward extension of the orebody which was productive on the 800-ft. level. The stockholders are voting on the bond issue to raise funds with which to sink the shaft from the 1200-ft. to the 2000-ft. level preparatory to further development.

NEVADA

TONOPAH LABOR SITUATION AGAIN NORMAL.—DEVELOPMENT AT DIVIDE.

GOLDFIELD.—Plans of the Development company for enlarging the mill to 2000 tons capacity practically have been completed and as soon as the increase in capitalization of the company has been approved by the stockholders machinery will be purchased. A winze has been sunk 8 ft. on the 12-in. seam opened on the 250-ft. level of the Combination. At 8 ft. the seam assayed \$11,000 in gold. A drift driven 68 ft. north in the vein recently opened on the 500-ft. level of the Red Hill has exposed for this distance ore averaging from \$18 to \$25, with assays of as low as \$8.20 and as high as \$41 for the width of the drift. Assays of from \$16 to \$31 were secured in a raise driven 50 ft. from a short south drift which passed out of the ore-shoot. Unimportant assays are now being obtained in the raise, which, while still in quartz, is thought to have been driven through the south-dipping shoot. The raise is being continued and a drift has been started north from a point 50 ft. above the level. A raise also is being driven from the north drift. At a meeting of the board of directors of the Yellow Tiger, held December 8, assessment No. 1, at the rate of 1 cent per share, was levied, the delinquent date being January 10. The officers of the company are Herman E. Clark, of New York, president; A. I. D'Arcy, vice-president and consulting engineer; Gordon M. Bettles, secretary-treasurer and general manager; H. G. McMahon and H. A. Riedel, directors. The number of directors of the Florence company has been increased from 5 to 9 to enable the transaction of business in New York without holding meetings at Goldfield. The new directors are connected with the Whicher interests.

SILVER PEAK.—The Mary, 10 miles north-east of Silver Peak, is practically closed as the result of a strike of the 15 employees. A compressor is being put in place and it is planned to resume work on a larger scale than before the labor trouble. This is a gold mine, the ore being found in irregular deposits. A number of long tunnels have been driven, but the greatest depth reached is less than 400 ft. Ore from the Nivloc and Mary is treated in a 10-stamp mill at Silver Peak. The Silver Peak Chemical Co. is constructing a 100-ton leaching plant 9 miles north-east of Silver Peak to treat what is said to be the only known deposit of water-soluble potash alum, of commercial size. The deposits are developed through eight shafts of an average depth of 75 ft. and 60,000 tons of material containing 20% potash alum is reported to be blocked out. A report on the deposit was made by J. E. Spurr in the early days of Tonopah and Goldfield and

after the War started it was sampled by E. E. Free of the U. S. Geological Survey.

TONOPAH.—Labor conditions in the Tonopah and Divide districts are again normal. During the first week of December a total of 92,710 oz. of bullion valued at \$139,565 was shipped from the Belmont, West End, and MacNamara mills. The West End paid a dividend of 5c. per share on December 9, making the total disbursements \$1,251,940, or 14% on the outstanding capital stock. The principal work in the West End is being done on the upper levels in the Ohio workings and on the 800-ft. level, where a cross-cut is being driven to cut the Ohio vein. The Belmont mill is treating over 3500 tons of ore weekly, much of which comes from the Tonopah Mining, Butler, Montana, and other mines. The MacNamara mill is treating over 60 tons of ore daily from the Tonopah Divide.

PIONEER.—From July 1 to November 30, 1925 ft. of development work was done in the Mayflower on the 200, 300, 400, and 500-ft. levels. According to a report issued by J. B. Kendall, general manager, containing revised estimates made in the past few days, there is 80,000 tons of ore of an average value of \$10 per ton blocked out in a vein 8 ft. wide, with 5000 tons of an average value of \$12 stored in the mine. The report places the capacity of the mill at 40 tons daily, based on recent capacity runs, and the extraction is estimated at 80%. Water supply at the Mayflower is a serious problem and it has been necessary to construct a 4000-ft. pipe-line to a spring recently purchased by the company. It will be necessary to develop more water at this spring to permit the mill to operate 24 hours daily, when the profit over all operating expenses in mine and mill will be from \$3000 to \$5000 per month, according to the report. The company levied a 1c. assessment on December 6, stock to be delinquent in 30 days. Mr. Kendall states that this would have been unnecessary but for trouble in the mill, principally from freezing.

DIVIDE.—The Sutherland, in the northern part of the district, has been closed until the company can be re-organized and additional funds raised through an assessment; 400,000 shares of stock have been sold for 5c. per share and 315,000 remains in the treasury. A 500-ft. shaft has been sunk and over 1000 ft. of lateral work has been done. A drift on the main vein of the district is being driven south-east on the 170-ft. level of the Brougher. A drift on this level is being extended north in a narrow ore-channel supposed to be the extension into Brougher ground of the Divide Extension vein. Assays as high as \$60 are being secured at this point. On the 500-ft. level a drift is being continued south-east in 8 in. of sulphide ore from which assays of from \$5 to \$30 are being secured. At the end of the main north-west drift on this level, 600 ft. from the shaft, a cross-cut is being driven to open a vein, the outcrop of which has been found. The Tonopah Divide has resumed sinking the shaft, which will be continued to water level. On the third level a cross-cut is being driven south-west toward the gold vein, which is expected to be reached with an additional 100 ft. of advance. On this level a drift is being driven north-west in the main vein to prospect the

territory toward the Brougher. On the fourth level a raise has been started in the 'gold shoot' opened several months ago. Assays of 17.2 oz. gold and 10 oz. silver are being secured from a 16-in. width in this raise. Cross-cuts are being driven from the south-east drift on the fourth level to prospect far into the walls of the silver vein, or main ore-channel.

UTAH

LABOR TROUBLES DURING 1919.—UTAH SECTION A. I. M. & M. E. MEETS.—NOTES.

SALT LAKE CITY.—After more than 30 days, during which Utah has been one of the few States not seriously

of men that would be thrown out of employment. One of the first metallurgical plants affected by this order was the International smelter at Tooele, which was compelled to draw the fires in several furnaces and lay off a number of employees, temporarily. At present the smelter is running one reverberatory and two blast-furnaces. On December 8, a telegram was received from Mr. Holden, advising that no exceptions would be granted to Utah industries falling within the 'non-essential' classifications. On the same date, local passenger service on the Oregon Short Line, Denver & Rio Grande, and Los Angeles & Salt Lake railroads was curtailed approximately 30%. On December 10, the Union Pacific Railroad Co. issued an embargo against the acceptance of freight of any de-

CONCENTRATORS OF UTAH COPPER COMPANY AT GARFIELD, UTAH. ARTHUR PLANT IN THE FOREGROUND. TAILING POND IN BACKGROUND WITH MAGNA PLANT AT EXTREME RIGHT

affected by the strike of bituminous coal miners, the development of shortage elsewhere, resulted in the first material curtailment of distribution in the State on December 5. Simultaneously with the announcement by railroad officials that they had been directed to distribute coal only to essential industries falling within the first five classifications of the Federal priorities list, came the announcement that the plant of the Utah Iron & Steel Co. was compelled to close down for lack of fuel, resulting in several hundred men being thrown out of employment. Mining and smelting companies were listed in sixth class. This resulted in a vigorous protest being sent to the State's representatives in Congress and to Hale Holden, regional director of the U. S. Railroad Administration at Chicago. It was pointed out that the metal mines and smelters of Utah are employing about 22,000 men, and that there were a number of less essential industries that could better afford to close down, considering the general welfare of the State and the number

of men that would be thrown out of employment. One of the first metallurgical plants affected by this order was the International smelter at Tooele, which was compelled to draw the fires in several furnaces and lay off a number of employees, temporarily. At present the smelter is running one reverberatory and two blast-furnaces. On December 8, a telegram was received from Mr. Holden, advising that no exceptions would be granted to Utah industries falling within the 'non-essential' classifications. On the same date, local passenger service on the Oregon Short Line, Denver & Rio Grande, and Los Angeles & Salt Lake railroads was curtailed approximately 30%. On December 10, the Union Pacific Railroad Co. issued an embargo against the acceptance of freight of any de-

scription, on account of climatic and fuel conditions in Wyoming. It is stated that when the coal mines of Utah are operating at full capacity, their daily output is 370 cars. At present the mines have plenty of cars, but there is a shortage of good miners. Labor troubles during 1919 in Utah cost the industries directly affected and the employees on strike a total of more than \$900,000, according to information furnished by the State Industrial Commission. Wages lost through strikes in the mining industry averaged \$3825 per day for a period of 40 days, making a wage loss of \$153,000, while the loss to the industry is estimated at \$517,242, making total loss of \$670,242. Wages lost through strikes in miscellaneous trades was \$2187 per day for a period of 93 days, while the loss to the industries is estimated at \$120,900, making a total loss of \$324,391. Therefore, the total loss to the State through strikes is approximately \$904,633. There has been little unrest in the State, due to the fact that labor leaders here are conservative.

The Utah section of the American Institute of Mining and Metallurgical Engineers held its semi-annual dinner and program at the Hotel Utah on the evening of December 11. Not in years has a more distinguished gathering of engineers been assembled in this city than on that occasion. John P. Gray, the well-known mining attorney of Idaho, acted as toastmaster. Speeches were made by H. V. Winchell, president of the Institute; Waldemar Lindgren, head of the Department of Geology at the Massachusetts Institute of Technology; W. E. Colby, professor of mining law at the University of California; Albert Burch consulting engineer of San Francisco; R. H. Haffenreffer, Jr., president of the Utah-Apex Mining Co.; and R. C. Gemmell, assistant managing director of the Jackling porphyry properties. Among the guests of honor were D. C. Jackling, of San Francisco, and engineers and attorneys from out of the city, who have been here in connection with the Utah Apex-Utah Consolidated lawsuit.

GOLD HILL.—Recent operations at the mine and mill of the Western Utah Copper Co. have been satisfactory, according to Owen F. Brinton, general manager. Sixty-two earloads, aggregating 3100 tons, were shipped during the past month. The mill has been operating steadily, without loss of time. The product of the treatment of the copper-tungsten ore, tungstic acid, is being stored, awaiting market developments. Development work in the upper levels at the mine continues to expose good ore. On the 700-ft. level, the drift along the foot-wall of the vein which has been developed from this level to the surface, has been driven a distance of 100 ft., all in ore.

EUREKA.—A car of silver-lead bullion, probably the highest grade produced at the Tintic mill for some time past, was shipped recently. The car contained 30 tons and was valued at \$100,000. Because of the prevailing high price of silver and the excellent grade of the bullion, the value was higher than usual. During the week ending December 6, mines of this district shipped to valley smelters 147 cars of ore, as compared with 150 for the previous week. The Chief Consolidated shipped 34 cars; the Tintic Standard, 27; Iron Blossom, 18; Mammoth, 13; Eagle & Blue Bell, 11; Dragon, 9; Centennial-Eureka, 8; Grand Central, 8; Colorado, 7; Gemini, 5; Ridge and Valley, 2; Victoria, 2; Alaska, 2; and Sunbeam, 1.

Officials of the Lehi Tintic company have outlined a policy for the development of the mine, which lies in the East Tintic district. The mining claims of the company are now being surveyed for patent. The property has been equipped with a 12 by 12-in. compressor, 40-hp. motor, 3 clipper drills, 1 water Leyner drill, an Anaconda air-hoist, and accessories. A 10,000-ft. pipe-line is to be laid by the company to ensure a water supply for the mine. The results of last summer's work in Tunnel No. 3 show conclusively the desirability of staying close to the known orebodies because of their peculiar occurrence in the limestone.

The output of the Ridge & Valley mine has been increased somewhat during the past two months by the

heavy shipments from the block of ground under lease to Messrs. Zalinski and Hillsdale, Salt Lake mining men, who have been operating in this district for more than a year.

Plans are being made by the Tintic-Standard Mining Co. to build a 50-ton mill upon its property in the eastern part of the district to handle low-grade ores, according to E. J. Raddatz, general manager. In doing development work considerable low-grade ore has been encountered near the high-grade. None of this low-grade material has been moved, except that necessary to reach the high-grade bodies. For some time the company has been conducting tests to determine the best method of treating this material. If the milling process proves as satisfactory as it has in the laboratory tests, the first 50-ton unit will be increased.

At a meeting of the directors of the Grand Central Mining Co. at the head office in Provo on December 11, a dividend of 2c. per share was declared, payable December 23. This calls for the payment of \$12,000.

PARK CITY.—Shipments of ore from local mines for the week ending December 6 show an increase over the previous week, being 2037 tons. Of this amount, the Silver King Coalition shipped 612 tons; the Judge M. & S., 593 tons; the Ontario Silver, 475 tons; the Daly, 54 tons; the Naildriver, 110 tons; and the Daly-West, 190 tons.

Recent development work on the 1100-ft. level of the Silver King Coalition property has opened up a high-grade orebody in a practically virgin part of the company's large estate. A thin streak of mineralization was followed off into a block of unprospected territory. For some distance the streak showed no improvement; then suddenly it spread into 18 in. of ore rich in silver and lead. Samples indicate a market value of around \$200 per ton. The lense is still widening, and promises to form one of the large chambers of ore which is characteristic of the western half of this district.

BRITISH COLUMBIA

SALMON RIVER DISTRICT PROMISING.—ORE RECEIPTS AT TRAIL.

STEWART.—The first shipment of ore from the Premier mine is still at Hyder, Alaska, awaiting shipment, according to P. Daly, who took it out under the terms of a lease he had from O. B. Bush in 1915. There is about eight tons assaying around \$200 per ton, which he will send to the smelter as soon as transportation is obtained. There is no doubt in the minds of mining men who have visited the various camps in the Salmon River district, as to their future. Without exception they are enthusiastic. M. W. Bruner, who has just returned, describes it as a most remarkable mineral belt and looks forward to seeing a railroad constructed up the Salmon river. Charles F. Caldwell, the well-known British Columbian operator, anticipates much development in the spring, and states that the mine-owners propose solving the transportation problem at once.

NELSON.—In the Kaslo district the Cork Province company has been reorganized in order to raise finances

for further development of large orebodies at depth and to acquire more water power, which is needed for the milling plant. The Silver Bell, Index, Gibson, Flint, and other properties are also under development. All these are new prospects opened within the last eighteen months. The Old Blue Bell, the oldest mine in the country, the Ainsworth, Florence No. 1, and several others have been shipping. The same rate of progress is being made in the Lardo district, where the White Water, Comstock, Bannockburn, Bullock, Silver Cup, Tenderfoot, and other properties are expected to be among next year's shippers.

SLOCAN.—The Silver Glance property, Bear Lake, has been bonded and will be developed quite extensively by the new owners. The vein in granite is a true fissure

TRAMWAY OF THE BRITANNIA MINE, HOWE SOUND, BRITISH COLUMBIA

about 25 ft. wide, striking north and south, and dipping about 60° to the east. Owners of the Index mine have acquired the Flint claim, on which some development has been done with satisfactory results, the consideration being \$22,500. A Government mining engineer in 1917 reported that "a nice showing of one foot of solid ore averaging 100 oz. silver and 65% lead" had been opened up.

VANCOUVER.—Maurice D. W. Bacon, of Los Angeles, has filed suit in Spokane against B. K. Neill, of Spokane, for a half interest in the Premier, formerly the Bush mine situated near Stewart, B. C. It is asserted by Mr. Bacon that a partnership existed between him and Mr. Neill; that the value of the Bush mine, as it then was termed, was misrepresented to him, and that Mr. Neill thus obtained possession. Mr. Neill states that there is no foundation for the claim made.

Percy Scott Leggatt, director for Thomas Summerson & Sons, railway owners and car builders of Darlington, England, is quoted as stating that his firm is considering launching an iron and steel industry here, perhaps drawing on the Lillooet limonite ores in the White Water Creek region. His firm is interested in smelters and refineries in England. Mr. Leggatt evidently is satisfied that the ore necessary is available. He seems to be impressed with the possibilities of the electric hearth methods of steel fabrication and, in this connection, declares that the imperative need is to obtain cheap power.

PRINCETON.—The property of the Princeton Mining & Development Co., situated on the Similkameen river about four miles from Princeton, is to be re-opened.

TRAIL.—Ore receipts in gross tons for the week November 21 to 28 inclusive, at the Trail smelter of the Consolidated Mining & Smelting Co. totalled 7708 tons. The chief independent shippers were Alamo, Alamo, 107 tons; Josie, Rossland, B. C., 721 tons; Mandy, Le Pas, Manitoba, 156 tons; North Star, Kimberley, 316 tons; Standard, Silverton, 403 tons. Of the company's properties the main contributors were Centre Star, Rossland, 2907 tons; Emma, Eholt, 479 tons; St. Eugene, Moyie, 1507 tons; Sullivan, Kimberley, 858 tons. It is apparent from the latter figure that the Sullivan mine gradually is recovering from the effects of the recent strike when all its employees walked out.

PRINCE RUPERT.—The Indian group, in the Salmon River district, is developing well, three shoots of milling ore having been cut in a 400-ft. tunnel. A second tunnel has been driven on the vein 150 ft. lower down the mountain, and in its 60 ft. of length has exposed some good ore. The Boundary group, which adjoins the Indian, is under option to the Granby Consolidated M. S. & P. Co. The Hercules Mining Co. claims have been bonded to C. F. Caldwell, and the Lake & O'Leary mine has been taken over by the B. C. Silver Mines, Ltd. The Drum Lummon mine, on Douglas channel, is turning out an excellent grade of copper concentrate; the assay return from the last shipment to the Tacoma smelter ran 62.88% copper, 0.68 oz. in gold, and 27.66 oz. in silver per ton. The Silver Standard mill, at Hazelton, which was closed temporarily on account of the freezing of the water in the supply pipe, is running again. As the pipe is now covered with snow, no further trouble is expected this winter. The Sunrise mine, near Hazelton and about a mile from the Silver Standard, has been bonded to the Guggenheim interests.

ONTARIO

CONIAGAS REPORTS.—NOTES.

COBALT.—The reported offer of the Northern Customs Co. to purchase the old La Rose mine has been rejected. The offer was voluntary on the part of the former company, the La Rose not having offered its property for sale. In the annual statement to be issued this week by the Coniagas company, an output of approximately 900,000 oz. of silver will be shown. This compares with

974,000 oz. during the preceding year. The average price of silver was 10c. higher during the fiscal year just closed, so that there will be shown an increase in the value of production. The Mining Corporation of Canada announces its intention to pass the regular dividend for the fourth quarter of 1919, due to loss of time during the recent labor strike. The purchase of a 70% interest in the Buffalo mine, and the purchase of a lease on the Foster mine has also depleted the treasury. The Peterson Lake company is resuming underground operations, and the mill is in readiness for operation at full capacity. Diamond-drilling operations commenced at the 319-ft. level of the Adanac. Other underground work in the meantime has been suspended. The Hargraves and the Reliance properties have been merged and will operate under the name of the Hargraves Consolidated. The company is capitalized at \$2,500,000 with 700,000 shares in the treasury. Work is to be started this month. A shipment of high-grade ore will be made during the last half of December from the Castle property at Gowganda, controlled by the Trethewey-Cobalt company. The new shaft has reached a depth of 100 ft. The Reeves-Dobie property at Gowganda is producing silver at the rate of about \$1000 per day. No definite information appears to be available regarding the ore in sight or the probabilities of continued output. At the leading gold mines of Porcupine, including the Hollinger, Dome, and McIntyre, the outlook is good. An official statement just made by the Ontario Bureau of Mines asserts that the industry is now almost on a pre-war basis, and that some \$10,000,000 is the indicated output for Ontario for 1919.

BOSTON CREEK.—Development is being energetically pushed by several companies. At the Miller Independence the delay in securing electrical equipment, which has held work back for some time, has been overcome. The road to the mine has also been completed. A mining plant is being installed at the Peerless and it is hoped to resume underground work about the first of the year. The Ivanhoe-Boston, a new company, has acquired a large group of claims lying to the north-east of the Patricia mine.

WEST SHINING TREE.—The shareholders of the Wasapika Gold Mines at a meeting held on December 2 ratified the plans submitted by the directorate for consolidation with three properties to the north and the formation of a new company capitalized at \$6,000,000 to be styled the Wasapika Consolidated. The Wasapika transfers its property to the new company for \$3,000,000, each shareholder receiving three shares for one.

Premier Ernest C. Drury, head of the newly founded Ontario administration, accompanied by Hon. Harry Mills, Minister of Mines, is making a tour of the mining districts of Northern Ontario to familiarize himself with the needs of the district. There has latterly been much dissatisfaction among the people of this part of the Province who were of the opinion that the Government was not aiding the opening up of the country sufficiently in consideration of its large contributions to the wealth of

the Province, and greater liberality in providing needed public improvements is expected to result from the visit of the new officials.

SONORA

NACOZARI CONSOLIDATED REPORT.—SEVERAL FLOTATION PLANTS TO BE OPERATED.

BUENA VISTA.—The Louisa Mining Co., a West Virginian corporation, operating the Buena Vista mine in the south end of the Moctezuma mining district, has completed the installation of a 50-ton flotation plant and soon will be shipping its product. Shipments of high-grade ore also will be started in the immediate future, hauling by wagon to Nacozari and from that point by rail to the smelter at El Paso. H. J. Wendler of Los Angeles is the manager.

PROGRESO.—The Progreso mine has begun shipping its concentrates and precipitates to Douglas, to be sent to the El Paso smelter and the refinery at Perth Amboy, New Jersey, respectively. For several weeks all of the mining properties of the southern part of the Moctezuma district and the northern part of the Sahuaripa district were unable to make shipments or get in supplies owing to the heavy rains which had washed out the roads.

NACOZARI CONSOLIDATED.—The annual report of the Nacozari Consolidated Copper Co., whose property is situated near the Pilares de Nacozari mines of the Moctezuma Copper Co., has been issued. From February 15 to November 1, 1919, 1540 ft. of driving had been done in the main development tunnel on the Galera group and 600 ft. of driving in the old San Pablo, the company's silver property. Actual mining expenses for the period were \$28,684.46, over \$8000 of which was spent for other than actual mine work, such as roads, motor-trucks, fuel, oil, and many other necessary items. Several deliveries of high-grade silver ore, returns from which have not been received, will swell the company's receipts soon. Of the company's 1,200,000 shares, 953,288 have been issued and 246,712 remain in the treasury. The breast in the main tunnel shows chalcopyrite and bornite in greater quantities than ever before and the east drift exposes a network of copper seams, indicating proximity to ore.

EL TIGRE.—This camp was water bound during the greater part of two weeks, roads being washed out and the Bavispe river too high to cross. Operation was maintained at normal level, however, the power-line extending from the Copper Queen smelter at Douglas not being affected by the storms. Quantities of concentrates accumulated, however, and the December shipments of the company should show a heavy increase. An attempt to hold up the stage carrying \$15,000 of the company payroll from Esqueda, the company station on the Nacozari railroad, to the mine, 35 miles east, was frustrated December 4, by military guards, one of whom was killed and another wounded. Several arrests have been made and it is predicted by the Mexican authorities that all of the six bandits participating in the attempt will be captured soon.

ARIZONA

Bisbee.—It is reported that an important discovery has been made in the shaft being put down on the Courtland property of the Great Western Mining Co. The ore was found at a depth of 350 ft. and was more than 5 ft. thick. The shaft was sunk where a diamond-drill hole revealed good prospects. The shaft is to be sunk to the 500-ft. level.

Douglas.—It is announced by Gordon R. Campbell, secretary of the Calumet & Arizona Co., that the company will again cut its production to 50% of normal.

Flagstaff.—Work is to be resumed on the property of the Navajo Copper Co., which is situated 125 miles north of Flagstaff. The property has been taken over by a syndicate represented by H. W. Malch of San Francisco. A leaching plant and concentrator are to be erected, and a 20-mile water-pipe line is to be laid.

Jerome.—Changes with the view to increased production at the United Verde Copper Co.'s mine have been made. Firing at the smelter is to be changed from oil fuel to powdered coal, the plant for the latter being practically completed. A Cottrell plant is also to be installed. Three additional 25 by 100-ft. reverberatories, two Great Falls converters, and eight 700-hp. Stirling boilers are being added to the smelter. Six of the last will run on waste heat from the furnaces.

It is reported that the Gadsden Copper Co. is sinking a winze on the 1200-ft. level in soft schist which carries native copper and copper oxide.

Miami.—The Porphyry Consolidated Copper Co. has purchased two No. 27 Star portable drills from the Miami Consolidated Copper Co., and other necessary equipment to carry out extensive exploration. The drills are now on the property. In addition the company has rented a diamond-drill from the Sullivan Machinery Co., to be used on the 650-ft. level.

The Superior & Boston Copper Co. has lately started regular shipments from the orebody recently opened in the foot-wall vein. The extent of the strike has not yet been fully determined.

Prescott.—The Yaba Copper Co. has been organized to operate the old Carrol holdings which parallel the Franco-American property. The Carrol property is a silver-gold producer of earlier days. The Dome group of claims owned by C. B. Hayes has been sold to the Dome Silver Mining Co. for \$15,000.

A new reduction plant is to be installed at the Monte Cristo mine on Groom creek as a result of the recent development carried on by W. D. Worthington.

Ray.—It is announced that the White Metal Mining Co., which acquired the Pioneer group of mines a year ago, is to commence shipments. A large tonnage of silver ore has been developed and plans are being completed for the erection of a flotation plant.

Swansea.—This camp is now operating with over 200 men on the payroll. Will L. Clark, formerly with the United Verde, is in charge and it is reported that high-grade ore has been opened on the 600-ft. level. Encouraging results are being obtained from the flotation plant recently installed.

Tucson.—A complete geological investigation of the Strat-

ton mines in the Old Hat district is being made to determine the site of the proposed tunnel. Claims and milling plant of the Emery-Whitcomb Tungsten Co. and the National Tungsten Co. in the Guijas district are to be sold at sheriff's sale as a result of the foreclosure judgment received by J. H. Emery against the two companies.

CALIFORNIA

Angels Camp.—The Lightner mine, an old-time producer and one of the bonanza mines of days gone by, is to be reopened by a company headed by Alex. Chalmers, who was superintendent when the mine was operating before. Work is to be commenced immediately. The shaft will be unwatered and repaired, the head-frame gone over, and the hoisting machinery put in condition.

Downieville.—Gold Exploration Co. is vigorously developing the Comet mine, in Jim Crow canyon, and has completed erection of several buildings. Cross-cuts show the vein is 65 ft. wide with sulphides and some free gold disclosed. A mill and concentrating plant may be installed next year. F. O. Richardson is general manager.

Engelmine.—Engels Copper Mining Co. has improved and remodeled the Superior mill and is shipping 50 tons of concentrate daily. Alterations and additions to the mill were under the direction of F. G. Sherwood, consulting engineer.

—Feather River Copper Co. has installed a two-stage, 300-cu. ft. Sullivan compressor, drills, and other equipment. Driving of the main tunnel, 2500 to 3000 ft. long, has begun.

Kennett.—Afterthought Copper Co. is treating 250 tons of ore daily in its flotation plant. The reverberatory furnace is making a matte running 25 to 28% copper; 110 men are on the payroll. —Uncle Sam Mining Co. has started development under Mr. Charlson, superintendent. It is planned to run a cross-cut from the Uncle Sam shaft to prospect the Alice, Clipper, Snyder, Croesus, and Dittmar-Monohan claims. —Mammoth Copper Co. is increasing development work and opening new ground.

Keswick.—Mountain Copper Co. has added a night shift to the force at Hornet mine. Shipments of sulphide ore to the Martinez smelter have been increased.

IDAHO

Bonner County.—The Lakeview Silver Mines Co., operating the Conjecture and Spider mines at Lakeview, is preparing for the installation of a 100-ton flotation mill early in the spring. Hydro-electric power will be developed and transmitted a distance of about three miles to the mine, where hoisting and shaft equipment is to be remodeled and a compressor installed. Development work has been in progress during the past six months, and a large tonnage of ore is already blocked out for the mill. T. C. Cunningham is superintendent.

Clarksfork.—The Lawrence Mining & Milling Co. is in receipt of \$2526 in net payment for a carload of lead-silver concentrates shipped to the East Helena smelter. This increases the total net receipts to \$55,500. The ore in the last lot contained an average of 14 oz. of silver and 75% lead, or a total of \$77 per ton.

The main tunnel, driven 1240 ft. from its portal, has just

passed through a porphyry dike 15 ft. wide, one-third of which on the hanging-wall side is mineralized with copper. Joseph Reed is manager.

Coeur d'Alene.—John A. Shelton, attorney of Butte, has secured an option on the control of shares in the Black Bear Mining Co. owning a property in the Lelande district.

The Tamarack & Custer Consolidated Mining Co. has declared a dividend of \$56,400, being at the rate of 3c. per share. This dividend is the first declared by the company in 14 months, and when paid will increase the total disbursements to \$446,992.

The Hypotheek mine has resumed work according to information from Otto A. Olson, secretary and manager at Wallace. This property is situated about three miles south of Kingston and over the divide west of the Pine Creek district.

Hailey.—The Federal Mining & Smelting Co. is completing a tunnel that will connect its Independence and North Star mines, near Hailey. The bore lacks about 400 ft. of completion. It penetrates a mountain and will permit the rapid delivery of ore from the Independence mine to the North Star mill.

Wallace.—The following notice has been sent by the Hecla Mining Co. to its stockholders:

"In reply to inquiries as to threatened litigation we wish to advise you that on November 22, 1919, we were served with notice of suit filed by Federal Mining & Smelting Co. alleging that we have mined and taken out ores belonging to them by virtue of apexing in the Russell lode mining claim. This claim is owned by the Federal and is under lease by them to the Marsh Mines Consolidated. Our answer to their complaint will be made only in court at the proper time. We may state, however, that the ore involved is only what is known as our East orebody and cannot affect the main orebody nor the Ore-or-No-Go, and that all ore mined by us has been taken from within our own lines. There is a great deal of misinformation being published on this subject, exaggerating the amounts involved and the probable effect on dividends.

"You are hereby notified that a dividend of 15 cents per share will be paid on December 28, 1919, to stockholders of record at the close of business on December 1, 1919."

MONTANA

Butte.—The North Butte company has recently re-opened the Edith May vein on the 3200-ft. level where it has a 20-ft. face of 6% copper ore. The company is now capable of a sustained production of 2,000,000 lb. of copper per month, and with high silver prices and increased mine efficiency the management has been able to effect a remarkable reduction in costs. In November its cost was below 13c. per pound and it has been a very long time since North Butte costs were anything like that.

Helena.—The Liverpool mine, the old silver property in the Lump Gulch mining district, which is being re-opened by the Liverpool Silver Mines Co., under the management of Eichelberger and Fryberger of Helena, has been unwatered to the 750-ft. level. At the 600-ft. level a considerable quantity of rich silver ore, left by previous operators, was found.

NEVADA

Denio.—Ashdown Mining Co. is erecting a 60-ton mill. Property has been developed by ten tunnels, with No. 10 level showing an orebody 3 to 7 ft. wide. All levels are said to be in good silver and gold ore. T. S. O'Brien is general manager.

Midas.—Arrangements have been made to sink the 225-ft. shaft of the Gold Circle Queen 100 ft. deeper. On the bottom level of the shaft the vein is 18 in. wide, assaying \$75 in gold. A test run is being made at the Koontz mill. R. S. Bolam is superintendent.

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

John B. Farish has returned from New York.

J. W. Teale, of Bainbridge, Seymour & Co., is in Brazil.

Malcolm Maclaren has returned from Rumania to London.

Clarence Woods has returned from Honduras to Los Angeles.

Tudor G. Trevor, Inspector of Mines in the Transvaal, is in London.

W. L. Honnold has gone to London, on his return to South Africa.

Oscar H. Hershey, on his return from Colorado, has gone to Oatman, Arizona.

H. V. Seale is now manager of the Junction North mine at Broken Hill, Australia.

Charles A. Banks is now established as consulting engineer at Vancouver, B. C.

E. J. Franklin, mechanical engineer for the Ray Consolidated Copper Co., is at Salt Lake City.

Ralph Stokes, Colonel and Chief Engineer of the British force on the Archangel front, has returned to London.

J. F. McCarthy, of Wallace, Idaho, has been nominated as chairman of the Columbia Section of the A. I. M. E. at Spokane.

William B. Daniel, general superintendent for the Nicaragua Mining Co., sailed from New Orleans on the 'Managua' for Bluefields on December 8.

S. E. Bretherton, Jr., who recently returned from an engagement on the technical staff of the Burma Mines Co., is now at Atascadero, California.

C. B. Lakenan, general manager for the Nevada Consolidated Copper Co., at McGill, Nevada, was at Salt Lake City recently, conferring with D. C. Jackling.

Frank Yeoman, of Oroville, California, and **W. W. Wishon**, of Searchlight, Nevada, have just returned from a detailed examination of the Cariboo district in British Columbia.

Joseph T. Singewald, Jr., professor of economic geology in Johns Hopkins University, has been granted several months leave of absence to engage in geologic work in north-western Peru.

R. F. Goodwin, assistant consulting engineer for the Guggenheim brothers and the Chile and Braden copper companies, was in Utah recently, on his way from British Columbia to New York.

Obituary

Benjamin Hollinger, discoverer of the Hollinger mine of Porcupine, Canada, died at Pembroke, Ontario, on November 26 at the age of 34 years. He took to prospecting when quite young, but had no marked success for some years, when the discovery of the celebrated Hollinger mine placed him in a position of affluence. He also discovered the Hollinger Reserve and was interested in a number of other mines. He leaves a widow and three children.

J. W. Moffatt, formerly manager of the Beaver and Temiskaming mines, at Cobalt, and a pioneer of Northern Ontario, died at Haileybury on November 27 of tuberculosis. He came to Canada about 14 years ago from Colorado, and engaged in mining. He built several mills, including those at the Penn Canadian, Silver Cliff, Beaver, and Kirkland Lake mines, and, until forced to retire owing to ill-health, was in charge of the Beaver and Temiskaming mines. He leaves a widow and one child. He was interred at Toronto on November 29 with Masonic ceremonies.

EASTERN METAL MARKET

(By wire from New York)

December 16.—Copper is quiet and firm. Lead is quiet and stronger. Zinc is dull and easy.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times, the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

MONEY AND EXCHANGE

When the Edge bill becomes law there will be two measures provided for financing export trade having Government approval. The other measure is the amendment to the War Finance Corporation Act authorizing that institution to extend loans up to \$1,000,000,000 "to promote commerce with foreign nations through extension of credits". Both measures are distinct, and while they operate with the same purpose, the administration and extension of credits are different.

The Edge bill provides for incorporation, under Federal charter, of private financial institutions, such as are not now operated, of two classes—one doing principally a banking business, like that done by international banking corporations already organized, and the other doing principally an investment business, taking long-time paper, including bonds and mortgages of foreign concerns, and subsequently issuing their own debentures against them.

There are eight organized international banking corporations helping finance foreign trade. These are American International Banking Corporation, Asia Banking Corporation, First National Banking Corporation, French-American Banking Corporation, International Banking Corporation, Mercantile Bank of the Americas, Park-Union Banking Corporation, and the Shawmut Corporation.

To facilitate flotation of proposed corporations under the Edge bill and provide necessary financial support from established banks, Congress has already legislated to permit national banks to invest up to 5% of their capital in such corporations. Authority of the War Finance Corporation to extend loans for commerce purposes has not so far been exercised. Explaining inactivity in this respect, the Secretary of the Treasury says in his annual report: "During the first few months after passage of the amendment, loans by the Treasury to foreign governments, authorization of the War Department to sell its surplus stock on credit, authority of the Food Administration to sell on credit, and special measures passed by Congress for relief of European nations, sufficed to maintain an exceptionally high level of exports, but the time has now arrived when this new authority conferred upon the War Finance Corporation is beginning to be used in the way contemplated."

The corporation is authorized to extend loans to persons and firms engaged in export trade, if such concerns are unable to obtain funds upon reasonable terms from banks. It may also loan to banks direct which have made loans to persons for exporting products. Loans may be made for not exceeding five years, and power for making loans is granted to the Corporation until expiration of one year after termination of the War as proclaimed by the President.

The War Finance Corporation holds large amounts of Liberty bonds as well as Treasury certificates. Liquidation of Treasury certificates at maturity and sale of a large part of holdings of bonds to the Treasury for its bond purchase fund, will enable the corporation to liquidate its bonded indebtedness, due April 1, 1920, and provide a considerable surplus of available funds. Stimulation of export trade, not only with European countries, but with South America and the Orient, will be the obvious result.

Quotations on December 16 are as follows:

Eastern Metal Market

New York, December 10.

The speculative nature of all the markets, particularly in London, is a feature. Advances have been recorded here in most metals.

Copper is higher and it is believed the low price has been reached.

The tin market has been quiet with prices steady and sales moderate.

Lead is strong and higher and supplies are scarcer.

Prices for zinc have advanced again due to the export demand and speculation in London.

Antimony is nominally higher.

IRON AND STEEL

A much more serious shortage confronts the iron and steel trade than that which has been a matter of concern for weeks. Restrictions in the use of fuel are likely to be in force for weeks, no matter if the Indianapolis meeting results in a settlement. Beehive coke-ovens are limited to 50% of the coal charged into them in November and by-product ovens are put on 30-hr. coking time, thus cutting their output by 50%. A 10-day enforcement of this order would result in a shut-down of nearly half the blast-furnaces of the country. A sharp flurry in the coke market last week resulted in an order from Washington restoring the war-time prices of \$6 at oven for blast-furnace coke and \$7 for foundry coke. Thus far iron and steel producing plants seem to have been hurt more than those of consumers. In the Pittsburgh district sheet and tin-plate operations are much restricted. Pig-iron prices continue to advance rapidly. Steel makers are less inclined to accept new business and the Steel Corporation maintains its policy of holding at the March 21 schedule of prices. Export orders booked in November do not bear out the report that American steel makers had withdrawn from the market.

COPPER

The market has taken a turn for the better. Electrolytic copper sold as low as 18c. a few days ago, but there has been a gradual advance since then until today the level seems to be 18.50c., New York, for early delivery and in some cases January shipment also. Lake copper is held at about 19c., New York, although last week it sold at the same level as electrolytic. These are the prevailing quotations of leading producers, and it is understood a good business has been booked with regular customers. Smaller interests are in a few cases quoting under this level, but 18.50c. seems a fair appraisal of the general market. There is a moderately active speculative market, which exhibits some unusual features. Speculators and dealers are bidding actively for the metal, and are paying as high as 19 to 19.50c. for electrolytic. There is also activity in copper speculation in London, which is having some effect here. Some believe that the low level was reached here last week at 18c. and a more confident tone is discernible. The copper stocks are also stronger in Wall Street.

TIN

The week has been a quiet one. Consumers have bought lightly because of the coal strike. The predominant influence, however, has been the fluctuations in sterling exchange. The decline on this first frightened sellers and then the buyers, and any advance in London was ignored. In that market speculation has been rife, and on Monday, December 8, tin advanced over \$5 per ton. This would ordinarily mean an advance here of 1c. per pound, but the rise was only ½c. Spot Straits, which had declined to 53.50c., was yesterday quoted at 54c. All favorable news has been

offset by the exchange situation. Future shipment, December-January, from the Far East has been quoted at 54.25c. with no buyers. One estimate is that the buying last week has been under rather than over 500 tons. Spot Straits in London yesterday was quoted at £308 10s. Arrivals thus far in December have been 1765 tons, of which 640 tons is credited to Pacific ports. The quantity afloat is 5890 tons.

LEAD

Curtailed production, which has been referred to before and which has been evident for some time, is now being felt in several directions; at least it is more noticeable. Some of the independent sellers are in a bad way, for they have not got the metal. Those who did have it have made good sales recently, as has also the leading interest. It is estimated that the tonnage for the week has been fairly large. The American Smelting & Refining Co. has been the cheapest seller, but in the outside market premiums of \$2 to \$5 have been asked and realized on some brands. Last Friday, December 5, the leading interest advanced its quotation from 6.75c. to 6.90c., New York, and from 6.50c. to 6.65c., St. Louis. The tone of the market is strong and the tendency upward. Outside of the United States lead supplies are also more limited. Supplies from Australia and Spain have been interfered with and the British government is still holding its stocks.

ZINC

The market is largely controlled by the London situation, where speculation seems to be a dominating factor. Advances have been recorded over there almost daily, and they have been reflected in this market. Yesterday prime Western for December and first quarter shipments sold for export at 8.37½c., St. Louis, or 8.72½c., New York, which we quote as the market. Domestic demand is very light. The strength of the market is also due to the lack of eagerness by large producers to sell. The coal situation is an uncertain factor also, so far as it may influence future output of metal. Export demand is excellent but the exchange situation is a deterrent factor. The price of zinc in London advanced £1 12s.6d. per ton on December 8 to £53 7s.6d. for spot and £53 17s.6d. for futures.

ANTIMONY

The market is strong and nominal at 9.50c., duty paid, New York, for wholesale lots for early delivery.

ALUMINUM

Wholesale lots of virgin metal, 98 to 99% pure, are unchanged at 32 to 33c., New York, for early delivery.

ORES

Tungsten: The market is devoid of feature and is quiet. Quotations are nominal at \$7 to \$15 per unit, depending on the grade, Chinese being the lowest. The Tool Steel Association has come out against the tariff on tungsten and there is very little chance of any action on this for some weeks, since Congress has too many important matters on hand. Ferro-tungsten is nominal at \$1 to \$1.15 per pound of contained tungsten, according to one authority, but the market has had no definite test lately.

Molybdenum: The market is dull with quotations nominal at 75c. per pound of MoS₂ in 90% concentrates.

Manganese: No transactions in high-grade ore are reported, and quotations are nominal around 50c. per unit. Importations in October were 15,863 tons against 48,917 tons for the same month in 1918. The total to November 1, 1919, is 285,274 tons against 431,299 tons to November 1, 1918.

DISCUSSION

MR. SULMAN AND FLOTATION

By Theodore J. Hoover..... 913

Reference to Mr. Sulman's paper before the Institution of Mining and Metallurgy in London on flotation and to subsequent editorial comment in the 'Mining and Scientific Press'.

SMELTING IRON ORES

By Dwight E. Woodbridge 913

An exception to a statement regarding the smelting of iron ore in the blast-furnace made in a recent communication from F. H. Mason.

AMERICAN MINING CONGRESS

By Edwin Higgins 913

A statement of the activities and aims of the American Mining Congress. The difference between that organization and the U. S. Bureau of Mines. Greatest field for the 'Congress' is in connection with legislation affecting the mining industry.

ARTICLES

TECHNICAL OPERATIONS ON THE SUAN CONCESSION, KOREA—V

By A. R. Weigall and J. F. Mitchell-Roberts... 915

The Suan mill. Equipment and flow-sheet. The treatment includes amalgamation, table concentration, and flotation. The products are gold-silver bullion and two concentrates, one of which contains approximately 3½% bismuth.

A CALCULATOR FOR MINE VALUATION

By Ross B. Hoffmann..... 925

An ingenious device for the mechanical solution of problems in mine valuation. With certain factors given any one of a number of unknowns can be determined.

MINERAL PRODUCTION IN BRITISH COLUMBIA

Staff Correspondence 930

While the production has declined, exploration and development have given encouragement for the future. Zinc output alone has increased.

Actual Experience with Marcy Crushing Efficiency is Convincing

Results accomplished mean more than abstract discussion—they speak in terms of lowered milling costs—and that's an interesting language to every millman.

There are very definite reasons for Marcy efficiency—in the first place Marcy Mills carry a smaller ball load and therefore economize in power—that's the reason for their increased mechanical efficiency.

Marcy Mills carry a small amount of pulp *and keep it moving*—rapid change of mill content is a recognized factor for higher crushing efficiency—then, too, the full weight of ball charge is effective for work.

Marcy Mills with the patented Marcy grate lead to lower crushing costs in every installation.

Here are the results that are accomplished—Marcy crushing is adapted to every metallurgical requirement:

1. Crusher product may be reduced to 10 mesh at one pass of the mill.
2. Crusher product may be reduced to -40 mesh when operating in conjunction with screens or classifier.
3. Crusher product may be reduced to flotation feed by Marcy Mills in closed circuit with mechanical classifiers.

Investigate the crushing operations at Inspiration, Engels, Braden, Utah, Kennecott, Sunnyside and other plants—and send for our booklet on "One Easy Step Crushing."

PRODUCTION of gold in Australia continues to decrease; for the first half of 1919 the total was 667,398 ounces, as against 750,249 ounces in the corresponding period of last year. Production elsewhere in the world is decreasing, slightly in South Africa, more pronouncedly in Rhodesia, West Africa, and India.

GOLD from South Africa is selling in London at a premium of 20%. This means a handsome increase of profit to the mines of the Rand. For example, to the Crown Mines company the premium means a gain of £49,000 per month. It will, of course, bring large tonnages of banket within the category of 'ore' and add considerably to the life of the mines. Financiers expect the premium to continue for several years. It is logical.

WE are informed that Mr. Horace Pomeroy, of Palo Alto, California, has been appointed the third member of the War Minerals Relief Commission, to fill the vacancy created by the death of Dr. Foster. Mr. Pomeroy is an experienced mining engineer and ought to prove a welcome co-worker with Mr. Philip N. Moore, on whom so much of the work of the Commission, owing to sundry circumstances, has developed. Mr. W. R. Crane, who has been acting as chief engineer to the Commission since the retirement of Mr. J. E. Spurr, has been appointed his official successor.

CONDITIONS in Russia are suggested by the following items from letters received recently from mining engineers. In the Don coal region, there is a general lack of food, because General Denikine has failed to consolidate the country behind his advance, so that the people see no improvement of affairs and regard his rule as but slightly better than that of the Bolsheviks. It is true they are no longer tortured or killed, but food and clothing are as scarce as ever. In the anthracite district the peasants have no flour-mills, so the manager has rigged up a mill out of the machinery available and he is now grinding the wheat, taking a pood of flour for every pood he returns; in this way he has been enabled to raise the bread ration to two loaves per day, instead of one, but as regards supplies of clothing he is in despair, the people being clothed in nothing but sacking made out of old bags found at the mines. Even this source of supply is exhausted, so that the outlook for winter is terrible. From the Spassky copper mine, in Siberia, comes the be-

lated report that Kolchak likewise was unable to consolidate the country behind him and this fact weakened his position greatly. The peasants have no more love for him than they have for the Bolsheviks, because he has not bettered their plight; they see only that their young men are conscripted and it is always fight, fight, fight. They are sick to the heart of the unending confusion and conflict.

IN the current bulletin of the Institute we find a page devoted to simplified spelling and the propaganda of "a small group of members of the Institute headed by W. H. Shockley". It appears that these gentlemen insist that the use of the so-called simplified spelling be submitted to the members for a ballot by letter. The Secretary quotes a couple of paragraphs from Mr. Shockley's correspondence to illustrate the horrors he wishes so intensely to inflict upon us. Members are warned that this is no joke but a serious propaganda forced upon the Institute under Section 4 of Article IV of the constitution, whereby any matter that is advocated by 25 members must be put to vote. We hope therefore that all our fellow members will take the matter seriously and get rid of it by an overwhelming vote in favor of protecting our language against the vagaries of cranks. Mr. Shockley is a friend of many of us and a man held in high regard for everything except his irritating persistence in this regard. We say "irritating" because, without any authorization, he took upon himself to use his weird style of spelling in writing the notices that he issues as secretary of the local section of the Institute. It was only the fact that he was a most efficient secretary and a man held in general esteem that prevented trouble over this trespass on the good nature of the local members of the Institute. If the spelling of the 'Bad Boy's Diary' is to be established, it will be necessary to re-print every book in the English language. The publications of the Institute are for men, not for children; nor are they meant as a field for the exercise of the orthographic eccentricities of any group of members.

LONDON continues to show interest in mining, despite the fall in sterling exchange. The impetus to a resuscitation of activity is due, in part, to the fact that the Government has lifted the Treasury restrictions on the raising of fresh funds for companies operating abroad. We note that the group of mining companies working in Siberia and associated with the financial initiative of Mr.

Leslie Urquhart are to be consolidated in a corporation having a capital of £12,000,000. The companies included in the projected amalgamation are the Irtysk, Kyshtim, Tanalyk, and Russo-Canadian. Of the total share capital, two-thirds is to be issued at once in exchange for the capitals of the existing companies, if the scheme is confirmed by the approval of their shareholders duly assembled. To holders of shares in the first three companies it is proposed to give two new shares for each share now held, whereas the Russo-Canadian Corporation's capital of three million \$5 shares is to be exchanged for 1,768,152 shares in the consolidation. Outstanding debentures will be exchanged for debentures of the new corporation, which will also provide shares for debenture-conversion rights and options. These rights, if exercised, will call for 1,171,379 shares altogether, making the total issued capital £9,628,351, so that 2,371,649 shares will be left for future needs. At present no issue of shares for cash is contemplated. The scheme is bound to be criticized by the shareholders of the constituent companies and it is unlikely that everybody will be pleased. The circumstances of the companies, as to finances and as to ore-reserves, differ widely. The proposal suggests an optimistic view of Russian affairs and a cheerful anticipation of the supersession of the existing political and economic chaos by stable government. The consolidation will strengthen the general position of these companies, but again brings forward the question whether it is not easier to make super-enterprises than to find the supermen to direct them. When they were started these companies had the personal attention of several able men, notably Messrs. Urquhart, Herbert Hoover, and R. Gilman Brown. Of these, Mr. Hoover has retired from participation in the management, but there remain Mr. Urquhart, who understands Russia and the Russians as few Englishmen or Americans do, and Mr. Gilman Brown, who has shown himself both an expert technician and an able adviser. The Russian managers at the mines have proved capable and loyal. A suitable organization should be forthcoming. However, the story of the big consolidations on the Rand and elsewhere has indicated how difficult it is to retain the personal touch, which makes management efficient, when an enterprise becomes too large for the close supervision of a man of high character and unusual ability.

SUNDAY supplements are too voluminous to maintain a high quality, even when forming part of such a newspaper as the 'New York Times'. In the last Sunday issue to reach us we read an account of the South African diamond industry that is full of ignorance of a subject concerning which any quantity of accurate information is readily available, for example, in the well known volumes by Mr. Gardner F. Williams. The writer of the rubbish in 'The Times' says that Alfred Beit was "worried to an early grave by thousands of match-making mothers", from which one might infer that he died young. "So great did the pest become that Sir Alfred made public announcement through his physicians that he was in no

physical condition to marry." A fabrication; moreover, Beit was never knighted. Next we are told: "Rhodes needed expert help, and he sent to America for it in the person of John Hays Hammond, who revolutionized diamond mining, and subsequently developed the gold mines at Johannesburg." Fiction. Mr. Hammond has not known, nor has he claimed to know, anything about diamond mining, nor had he anything to do with the mines at Kimberley. The American engineer, who was engaged through the Rothschilds, was Mr. Williams, as every member of the profession is aware. Another gratuitous item of misinformation is the statement that the diamonds of South Africa "are invariably found in the craters of extinct volcanoes". They are indeed found in the choked vents through which igneous matter has been forced, but not "in craters". A crater is the bowl-shaped cavity made by violent plutonic action; the writer of the article was misled by the fact that the mines at Kimberley were worked in a big open-cut of crater-like form; it was man, not nature, that made the crater now familiar through the photographs of the De Beers mine. In short, the author of the article made as many foolish blunders as was possible in the space at his command, and yet he signs himself "former editor of the Johannesburg 'Daily News'". Our esteemed contemporary has been hoodwinked.

IF any doubt exists as to the present decline in gold mining, it should be dispelled by a study of the statistics and graphs prepared by Mr. H. N. Lawrie and published by the American Mining Congress. Most of the data appeared in an article by Mr. Lawrie published in our issue of October 26, 1918, but we are glad to see the subject further ventilated. The figures of production and consumption are from Geological Survey and Mint records, the estimates for 1919 being based on actual statistics covering the first ten months of the year. Since the peak was reached in 1915, the value of the gold produced in this country has steadily declined from \$98,000,000 to \$55,000,000, a decrease of 44%. Two-thirds of the output during the decade 1908 to 1917 was from siliceous ores, and one-fourth from placer operations, while the remainder was derived as a by-product from base-metal mines. This last source is comparatively small, it fluctuates very little, and does not greatly influence the total production. Obviously this remarkable decrease in production is the best possible evidence, if any be needed, for substantiating the assertion that many productive gold mines have been compelled to discontinue operations by reason of adverse economic conditions. Certain individual producers doubtless have exhausted their ore-reserves, but under favorable circumstances the usual proportion of exploratory and developmental work would have made new mines, and new ore in old mines, available, to an extent more than sufficient to offset ordinary depletion. Moreover, while wages and the prices of commodities remain where they are, these difficulties will be aggravated rather than improved, and further decline in production will necessarily follow. On

the other hand, data on the consumption of gold for the manufacture of jewelry and other industries during 1919, reveal an increase since 1908, from \$31,000,000 to \$65,000,000, or slightly more than double. Reverting to the figures of production, it appears that for the current year manufacturers will use \$10,000,000 worth of gold, over and above the output of the mines; and that the annual monetary surplus, which from 1908 to 1916 ranged between \$45,000,000 and \$60,000,000, will have been converted into a deficit. At the same time the gold reserve of the country is being depleted, as a result of the removal of the embargo on gold exportation; a net loss of 6.1% in the stock of monetary gold being recorded for the three months' period from July to October. Rather than allow the monetary reserve to decline too far, the industrial consumption will necessarily be limited by Federal authority, to accord with the amount of gold newly produced, so that jewelers and other manufacturers will be the first to suffer from the continued decrease of output, which must certainly result if no action is taken to assist the producers.

Apex Suits

One legal battle arising from dispute over extra-lateral rights to orebodies has been concluded recently in Montana; another is progressing laboriously in Utah; and rumblings of a third come from Idaho. The cost of these performances is large, and out of proportion to their public value. The Bingham case has been in court for a hundred days at an aggregate cost, to both sides, it is reported, of \$2500 per day. This represents only a small part of the total expense incurred, for, apart from the retainer paid to attorneys and expert witnesses, it is necessary to do a large amount of work in the mines for the purpose of proving or disproving the points in controversy. To do this it is customary to drive cross-cuts, drifts, and raises at various points in both mines, in order to throw light on the lode-structure. Occasionally, as in the old litigations at Butte, such work leads to the finding of new orebodies, but usually it has no economic value. Even the scientific evidence that it may furnish is obscured by the need for using it for partisan, and essentially unscientific, purposes. The total cost of presenting the Bingham suit, including work in the mines, models, witnesses, and attorneys, is estimated at \$250,000 for each side. The recurrent spectacle of half a dozen first-rate men, often university professors of distinction and scientists of high repute, testifying that something is black, while an equal number of equally able and honorable men swear that it is white, is both a public scandal and a satire upon our juridical system. Usually the evidence would justify a conscientious and competent observer in giving a qualified and hesitating testimony, which may be termed 'gray' in distinction to the positive 'black' and 'white' of the opposing array of so-called experts. They, of course, play the part not of scientific witnesses, but of special advocates, using their geologic training to best each other and thereby either to aid the

trespass of one mining company upon another or to help one of them in repelling the invasion of his territory. Obviously the engagement of expert witnesses should devolve upon the court, not upon the litigants, who, however, should share the cost involved. This would be economical, because three men of established character, as truthful and accurate observers, would suffice to take the place of the dozen or more men now engaged by the two sides. Two of them might be chosen by the two sides and the other by the judge. The occupation—for that it is to some—of 'experting' in mining litigations would then become one of dignity and honor; moreover, the geologic findings would have a scientific value that cannot be accorded today to the biased explanations that are heard in court. This suggestion is not new, but the Bingham case renders timely a serious consideration of it, in the interest of the geological profession, as well as of the mining industry.

The New Evangel

The week between Christmas and the New Year is a period that prompts the memory and the imagination, bringing to mind old friends and awakening hopes of the future. For while, at least, we are in a 'giving' mood, our selfishness is softened, our sympathy is warmed; we feel the promptings of the message that the angels brought to the shepherds of Bethlehem. Our own Christmas here in California is made glad with warm sunshine and brilliant verdure; we are spared the rigor of winter and the desolating touch of frost. Scarcity of coal does not trouble us; the lack of food does not occasion anxiety; our community is rich and happy; the cries of the destitute may cross the stormy Atlantic, but they are faint by the time they reach us; the call of the hungry in lands wasted by war fades with the fragrant air that stirs our evergreen foliage. We are content, even complacent; we are tempted to thank God that we live in California and that we may keep detached from the miseries that befall others less comfortably circumstanced. With the sense of physical well-being comes a mental self-satisfaction that finds expression in the desire to keep aloof from the troubles and tribulations of the world outside. How far that feeling of detachment can go, to what depths of ignoble selfishness it may descend, is indicated by a letter appearing in one of our local newspapers, in which it is suggested that "a large muslin sign should be stretched across the altar of every church, saying, 'Learn How to Mind Your Own Business' . . . These seven words if debated on the way home would be equal to a sermon". This sentiment is endorsed by the editor, who, in smoother phrases, plays on the same rotten string, preaching irresponsibility for the plight of Europe and callous disregard of the difficulties that have befallen the nations with which we stood recently in battle as comrades in a great cause. The sympathy expressed for the friendly nations is hardly distinguishable from the cold tolerance shown for the enemy countries. Our Christmas message to friend

and foe alike is, apparently, "Mind your own business and we will mind ours; you have your troubles, we have some of our own; the War is over; let each go his way". Perhaps an older cynicism will serve to express the same idea: "Each for himself, and the Devil take the hindmost". One might think so, reading the newspapers with which San Francisco is afflicted, but fortunately they reflect neither the best thought of this community nor the real sentiment of the American people, which is nothing if not generous, and evermore responsive to the ideals of free men. In the Book that was handed down by the Pilgrim Fathers, and has inspired Christian civilization in this and other countries for two thousand years, we remember reading a different message. In a land recently the scene of modern warfare, tanks included, there walked a teacher of gentle mien, who spoke of a second of two great commandments that was like unto the first, and it was: "Thou shalt love thy neighbor as thyself". That sentiment is the very breath of Christianity and the very soul of Civilization; it separates the cosmic struggle of existence from the human progress that is founded on a code of ethics; it divides the state of nature from the organization of society; it marks man's effort to escape from the rapine of the jungle to the amenities of a peaceful community. The shriveled soul that suggested the desecration of the churches by the blatant advertisement of his innate meanness is a recreant to civilization; he is so little the heir of all the ages of man's constant effort to mitigate the cosmic struggle by human kindness that he seems to be a throwback to the savagery from which his fellows have painfully emerged. Let us forget him; his creed is not ours. The memories of the last five years are too searing to be easily disregarded; the meaning of our dedication to a great cause is yet to be fulfilled; what shall it profit a nation if it gain all the gold in the world and lose its own soul?

National Resources

Amid so much that is merely confusing, if not destructive, it is a pleasure to read the annual report of the Secretary of the Interior. We have not seen the full text, but the excerpts given in the 'New York Times' suffice for friendly comment. This last report from the Department of the Interior has special interest because it has been announced that the Secretary, Mr. Franklin K. Lane, expects shortly to resign. Rumors to this effect have been frequent for several months, it being reported that Mr. Lane has been offered a highly remunerative appointment in New York. With him will go one of the few able members of the President's cabinet, which has been remarkable for its mediocrity of talent. Mr. Lane has imagination and foresight; he shows sympathy with those engaged in the industrial development of the country and a clear understanding of the character of our natural resources. A Californian by birth, he knows the West, and during his term of office he has proved a good friend to the bureaus that are engaged in giving scientific aid to the miner. He refers to the coal strike and points

at the fact that "we live virtually by unanimous consent", because if less than one-half of 1% of our population quits digging coal, we are threatened with famine and pestilence. He refers to the seasonal fluctuation in the demand for coal as responsible for many of the difficulties leading to the strike. Obviously what is needed is some means for storing coal without detriment to its quality. Although we have only 8% of the world's population, we produce 46% of all the coal consumed. A well regulated export trade would balance the fluctuation in the domestic demand for fuel. Wastefulness, of course, is another item in the account. "At best one-fifth of our coal is wasted", says the Secretary. Next comes the proper use of our water-powers. Of the horse-power in prime movers, 70% is east of the Mississippi, whereas of the available water-power 70% is west of that river; therefore, says Mr. Lane, "unless the East is to lose its industrial supremacy; it must press, and press hard, for the development of all water-power possibilities". From a national standpoint, it does not matter whether East or West holds the industrial supremacy, but it does matter whether our waterfalls and torrents are allowed to run unproductively, in neglect of their capacity to lighten human toil. Other subjects of timely interest are discussed in the annual report. We are compelled, for lack of space, to pass to "the conservation of the American man", concerning which Mr. Lane has many useful things to say. He says that this is "the most neglected of our resources". For example, 25% of the 1,600,000 men between 21 and 31 who were first drafted into the Army could neither read nor write our language, and tens of thousands could neither speak nor understand it. To them the reported doings of Hindenburg or of Hoover were alike transmitted only by word of mouth, if at all. Mr. Lane has written and spoken often on this topic during the last three or four years, and he has performed a national service by doing so. The War has made the American people conscious of its heterogeneity and aware of the need for promoting homogeneity by benevolent assimilation, through education, of the mass of undigested Europeanism that exists in the body politic. This democracy cannot exist half-American and half-alien; the old leaven of New England, not the new yeast of Russian, German, or Irish origin, must prevail if the United States is to follow the destiny to which it was called by Washington, Lincoln, and Roosevelt. The Army has done splendid work as a school for Americanism, not Americanitis, which is an ugly travesty of patriotism. The War Department offered a course in English, followed by full citizenship, to aliens who enlisted for three years. This educational scheme proved extraordinarily successful. We hope that it will be continued upon an increasing scale; the education together with the discipline has proved wonderfully effective in turning the raw material from Europe into a good American product. The spirit of the experiment was right; it was sympathetic. That is the only spirit in which to tackle this fundamental problem, which has become so insistent since the War.

Mr. Sulman and Flotation

The Editor:

Sir—Will you allow me to say a few words in extenuation of Mr. Sulman's "unscholarly failure to make the customary references to previous writers on his subject".

I hold no brief for Mr. Sulman and certainly none for Minerals Separation, Ltd. In fact, no engineer has suffered more from the vindictiveness of this company than myself, extending over now nearly ten years; yet I am without rancor or animus.

Mr. Sulman is simply suffering from the same cause, directed by the same intelligence, which directs the rest of the objectionable policies of this metallurgical octopus. Most of the matters in Mr. Sulman's paper which are now newly published were written ten years ago and were embodied in a treatise referred to in the preface of my book, 'Concentrating Ores by Flotation'. This treatise has been suppressed by the Minerals Separation, Ltd., during all these years along with much other information which should have been published as a matter of good morals and good citizenship. But it was suppressed, and now that a belated permission is granted Mr. Sulman to publish his ideas, he apparently cannot orient himself to the fact that in the ten years in which he has supinely not quarreled with his bread and butter, other men have discovered and published most of his ten-year old original thoughts. He still seems to be in the atmosphere of ten years ago; a good instance of the blight spread over technology by this company.

I think you censure Mr. Sulman with a little too much harshness, Mr. Editor, for his seemingly unscholarly mannerisms; the blight which has prevented his publication has also extended to his reading; and therefore the charitable view is that he is unaware of his transgression.

No such a charitable view would seem justified, however, in the matter of his laudation of the brain of the octopus. This would seem to a candid observer to be simply the price paid for permission to publish.

Smelting Iron Ores

The Editor:

Sir—In your issue of December 6 is a communication from F. H. Mason in which he says that "the bulk of the accessible ore on the Pacific Coast is magnetite, which cannot be reduced by ordinary blast-furnace practice without an addition of more reducible iron ore".

This is so diametrically opposed to the fact of furnace practice that it cannot be permitted to pass without denial.

DWIGHT E. WOODBRIDGE.

Duluth, December 8.

American Mining Congress

The Editor:

Sir—In your issue of December 6 there appears an article replete with witticisms, satire, and some direct statements criticizing the American Mining Congress. In justice to this organization, it appears to me that further light should be shed on this subject.

In the editorial to which reference is made, after commenting on the plans of enlargement of the Congress, the following statement appears: "In short, the Congress is to organize a Bureau of Mines." The plan of the Congress, to secure information relating to the mining industry for the benefit of its members, is referred to as "grandiose", and "fine and large"; the latter doubtless is intended as irony or sarcasm. It is further set forth that the Bureau of Mines is fulfilling to the satisfaction of all the offices that the Congress purposes to fill.

In order to consider the righteousness of the charges against the American Mining Congress there is offered herewith a quotation from the revised Organic Act (37 Stat., 681), under which the Bureau of Mines was organized:

"Sec. 2. That it shall be the province and duty of the Bureau of Mines, subject to the approval of the Secretary of the Interior, to conduct inquiries and scientific and technologic investigations concerning mining, and the preparation, treatment, and utilization of mineral substances with a view to improving health conditions and increasing safety, efficiency, economic development, and conserving resources through the prevention of waste in the mining, quarrying, metallurgical, and other mineral industries; to inquire into the economic conditions affecting these industries; to investigate explosives and peat; and on behalf of the Government to investigate the mineral fuels and unfinished mineral products belonging to or for the use of the United States, with a view to their most efficient mining, preparation, treatment, and use; and to disseminate information concerning these subjects in such manner as will best carry out the purposes of this act."

The following is quoted from literature of the American Mining Congress:

"The American Mining Congress is a voluntary asso-

ciation supported by the fees and dues of its members. It is striving to bring about:

"First: Safety and efficiency in mining operations.

"Second: Intelligent conservation with a view to the highest utilization and the prevention of waste of mineral resources.

"Third: The protection of mining investors against fraud and misrepresentation; the stimulation of investment in real mining and to demonstrate that mining is a business and not a gamble.

"Fourth: Uniformity in State laws governing mining operations carried on under like conditions.

"Fifth: Such Federal co-operation through research and investigations as will solve those problems of production, treatment, and transportation which are essential to the highest development of the Mining Industry.

"Sixth: A solution of the economic problems underlying the coal industry.

"Seventh: A more complete co-operation between miner and operator through the settlement of disputes by the economical rule of reason, rather than by the wasteful method of strikes and lockouts, and to foster in every possible way those conditions which make for just, considerate, and helpful employers and well paid, efficient, and loyal workmen."

It is obvious that while the purposes of these two organizations are similar, the aims of the Congress, numbered third, fourth, fifth, and seventh are not covered in the organic Act under which the Bureau of Mines was established. However, this does not exemplify the great difference between the two organizations, namely, the methods of accomplishing their respective purposes. It is well known that the Bureau of Mines has no police power, and that its work is done by co-operation with officials of mining and metallurgical operations. In order to secure this co-operation, assurance is usually given to operators by officials of the Bureau of Mines that information secured from them will be held confidential. Obviously, such information is not open to the public, except as it may eventually be given publicity through the periodicals of the Bureau of Mines. It is pointed out that, on account of the length of time required for many of the Bureau's investigations, lack of funds, and other causes, two or three years might elapse in some cases before the results of certain investigations can be published.

The activities of the American Mining Congress are not fettered by Government regulation. The Congress is a free agent, working in co-operation with the Bureau of Mines. Its greatest field of activity is in connection with legislation affecting the mining industry, a field which cannot be covered by the Bureau of Mines. Let us suppose, for instance, that some ill-chosen legislation is proposed in Congress, and it is desired that certain information be brought immediately to the attention of our lawmakers at Washington. The Bureau of Mines probably could not supply the needed information on account of the nature of its investigations, or the fact that its policy is to regard as confidential any information that might have been secured. The final report of the Bureau on

the subject in hand might easily be too late for use by a year or two. Obviously, the Bureau of Mines cannot be of use to the mining industry in political affairs; that field can be covered by the American Mining Congress. Those who are conversant with the accomplishment of the Congress in this direction know that this organization is essential to the welfare of the mining industry.

To intimate that the American Mining Congress is unnecessary because of the existence of the Bureau of Mines is tantamount to saying that because we have a Department of Agriculture, there is no necessity for an organization of farmers; because we have a Department of Labor, there is no necessity for organizations of employers or employees; because we have a Treasury department, there is no necessity for the existence of private banks. In short, why have any organizations of any kind in this land of ours, because we have a Federal government?

In the latter part of the editorial the words "absurd", "foolish project", and "blunder" are used to characterize the proposed activities of the Congress. The organization chart of the Congress (and no efficient organization should be criticized for having such a chart) is humorously described as "one big black balloon attached to six baby-balloons".

The editorial ends by admonishing Mr. Callbreath, the secretary of the Congress, to "stick to his knittin'". Had the author of this statement been present at the annual meeting of the Mining Congress at St. Louis in November last, and had he there heard the unanimous resolutions of thanks to Mr. Callbreath and other officials of the Congress for their accomplishments on behalf of the industry, he would have realized that representatives of mining from every part of the United States consider that the Congress is "sticking to its knittin'". The proposed plan of enlargement will enable it to stick even closer and accomplish more good for the mining industry.

EDWIN HIGGINS.

San Francisco, December 15.

[We are glad to publish this letter from Mr. Higgins. We agree with him that "the greatest field of activity" of the Mining Congress "is in connection with legislation affecting the mining industry, a field which cannot be covered by the Bureau of Mines". That is exactly the point we were trying to make; when we advised Mr. Callbreath to "stick to his knittin'", it was because we held, as stated in the editorial under discussion, that the proper function of the Mining Congress "is to serve as a permanent lobby at Washington in behalf of the mining industry".—EDITOR.]

ORES of tin are scarce in the United States, and their occurrence in Alaska is therefore of interest. Stream tin has been found in gold placers in the Ruby district at several places, but not in quantities large enough to pay for mining it except as an accessory to the gold. A short discussion of the tin in this district by Theodore Chapin is given in Bulletin 692-F, U. S. Geological Survey.

between the bars, and set at a slope of 42°. The under-size goes to the mill-bins and the oversize to the secondary crushers, of which there are two. The secondary crushers are of the same type as the primary crushers, but set to crush down to one inch. Eighty-five per cent of the crushed ore in the mill-bins is reduced to less than one-inch size.

The speed of the primary crushers is 220 r.p.m., and of the secondary crushers 270 r.p.m. The power required for one primary and one secondary crusher is 28 hp. (peak) and one 50 hp. induction-motor, Westinghouse A.C. type H.F., 440 volts, 60 cycles, 575 r.p.m., drives a primary and a secondary crusher.

One set of cheek-plates and jaw-plates has a life of about eight months in both primary and secondary crushers, during which period they are turned end for end.

ORE-BINS. There are two flat-bottomed bins, one for each 20 stamps, each of a capacity of from 375 to 400 tons. These bins are each 35½ ft. long by 13½ ft. wide by 16 ft. deep. The feeders are of the standard Challenge type of suspended ore-feeder, one to each five stamps.

STAMP-BATTERIES. The frame is of a special four-post type with a central drive to each 10 stamps, formerly driven by one cam-shaft pulley of 6 ft. diam. and 18-in. face. This design did not prove satisfactory and resulted in an undue number of broken cam-shafts, which defect led to the substitution of two cam-shaft pulleys, each to drive five stamps. Those two pulleys are set together in pairs so as to be both driven by the same belt and motor. The faces of the pulleys are each 12 in. wide and turned so as to be 3/18 in. higher on the edge of contact to cause the 18-in. driving belt to ride evenly on the two pulleys. The pulleys are kept together by the cam-shaft collars and the thrust of the cams.

Power for each 10 stamps is provided by a 35-hp. induction back-gearred Westinghouse A.C. type C.S., three-phase motor, 440 volts, 60 cycles. The speed of the rotor-shaft is 692 r.p.m. and of the counter-shaft 168 r.p.m. The driving pulley is 22½ in. diameter, crowned.

Each stamp weighs 1050 lb., made up as follows:

| | Lb. |
|---|-----|
| Stem, 3-7/16 in. diam., 15 ft. long, weight..... | 450 |
| Tappet, 13 in. long by 9 in. diam., weight..... | 115 |
| Boeshead, 20 in. long by 9 in. diam., weight..... | 285 |
| Shoe, 10 in. long by 9 in. diam., weight..... | 190 |
| Gibs, cotters, etc., weight..... | 10 |

The cam-shaft is 6-in. diameter. The cams have a 9-in. lift and a 2½-in. face.

False dies are used to take half-worn shoes, these being placed upside down in the casting and used as dies. False dies of various heights are likewise employed to assist in maintaining a constant depth of discharge. By this practice the weight of the stamp is maintained, the shoes being removed when half-worn and new shoes substituted, the half-worn shoe then being used as a die. The best and most even wear on shoes and dies is obtained by using a chrome-steel shoe with a Pennington die, or the reverse. By this practice less cupping ensues than when the shoe and the die are both of the same material.

The average life of the various parts of the battery is as follows:

| Parts | Materials and approximate life |
|------------------|---|
| Stem | Mild steel, four years |
| Tappets | Chrome-steel, two to four years |
| Heads | Chrome-steel, two to four years |
| Shoes | Pennington and chrome-steel, 100 to 120 days |
| Dies | Pennington and chrome-steel, 100 to 120 days |
| Cam-shafts | Hammered Norway iron, three months to three years |
| Mortars | Cast-iron, only one replaced in 10 years; broken by a gellignite plug |
| Liners | Manganese-steel, seven months to one year |
| Screens | Rek-tang, 20 to 60 days |

The mortars are of the narrow Homestake quick-discharge type and weigh 8000 lb. each. They are lined with manganese-steel plates. The back liners are made in two sections; the top one being three inches wider than the bottom. This admits of changing the top liner, which is subject to the greatest wear, without disturbing the false dies or the remainder of the liners, which have practically twice the life of the back liners.

The mortar-blocks are of reinforced concrete, one continuous block accommodating four mortars with their corresponding eight posts. A ¾-in. rubber mat is placed between the concrete and the mortar. The shoes of the battery-posts rest on a 12 by 12-in. pine block embedded in the concrete. Pacific guides are used on all batteries in the mill. The cast-iron bushings have a life of approximately one year.

The stamps operate at 104 drops per minute. The height of drop is 9 in. for the central stamp, 8½ in. for the two adjoining stamps, and 8½ for the two end stamps. The order of drop is 1-4-2-5-3. The screen-frames are made the full size of the opening in the mortar. After trying various types, only Rek-tang screens are now used; these have openings of 0.04 and 0.035 inch. The lower half of the frame is covered with 0.04-in. screen and the upper half with 0.035-in. screen. In order to increase the stamp-duty, the lower edge of the screen is given an inset of two inches, bringing it within 1½ in. of the die. An average depth of discharge of 2½ in. is maintained and the bed of ore on the dies kept as thin as possible without allowing pounding. The battery feed-water is introduced at the two ends of the ore-chute. The ratio of water to ore in the battery is from 4.5:1 to 5:1, and occasionally reaches 6:1, this proportion being necessary on account of the high specific gravity of the ore and the difficulty of keeping the plates and traps clear. Our practice, while increasing the stamp-duty, has a tendency to loosen and carry away amalgam as well as to scour the plates. An average stamp-duty of from 6.5 to 7 tons per 24 hours is obtained. A duty of 9.17 tons per 24 hours has been reached for a month and an average duty of 8 tons has been maintained for a period of several months, but the ore now milled is harder than formerly and the average stamp-duty has dropped to 6.75 tons.

AMALGAMATION. While inside amalgamation is not practised in its true sense, there being no chuck-plates, quicksilver is fed to the batteries every half-hour, the amount being regulated by the condition of the amalgam on the apron-plates, which is kept rather stiffer than is usual. As the battery-pulp is fed directly into a Pierce

BULL PACKING CORD-WOOD

A COOLIE ENJOYING A SMOKE

trap that is replaced every morning, very little change is noticed on the plates during the early part of each day and until the amalgamated surfaces of the trap get into condition; so that for this period the amount of quicksilver fed to the mortars has to be guessed. During this period, however, it is not so important that the exact amount of quicksilver should be added, because the trap-plates contain an excess of mercury after being freshly dressed. The average amount of quicksilver fed into the boxes is 0.17 oz. per ton of ore milled.

The pulp from the mortar flows directly to a Pierce amalgam-trap, 26 by 24 in., set at a fall of five inches per foot. The trap discharges onto an apron-plate of $\frac{1}{8}$ -gauge copper, 27 in. wide by 72 in. long, set at a fall of one inch per foot. The head traps and apron-plates are cleaned every morning and the tail traps every other morning. The apron-plates are dressed every four hours with a solution of ivory soap and borax. An occasional dressing with a solution of caustic soda is also given. After the removal of amalgam, the trap-plates are dressed with a weak cyanide solution (0.2% KCy), and then placed in a bath of mercury. Any excess of mercury is removed with a short worn whisk-broom, and the

plates stood on end to drain. Thus they go to the traps quite wet. Plates require re-silvering about once a year. This is done at the mill, two ounces of silver per square foot of plate surface being used.

The narrow width of the apron-plates is due partly to the width of the Pierce traps, but is also accountable to the fact that the larger part of the amalgam is caught in the head trap. The amount caught on the apron-plate is practically all deposited on the upper half and what passes this portion does not stick again, but is caught in the tail trap. At first apron-plates of the usual size were used, but, with the introduction of Pierce traps, the plates were reduced to their present dimensions without any falling off, but rather an increase in the proportion of gold recovered by amalgamation.

Apparently the small amount of bismuth sulphide in the ore has no bad effect on amalgamation. However, when treating concentrate containing 3 to 4% of bismuth in an amalgamating-barrel, there is a large loss of quicksilver, probably due to 'sickening' caused by the bismuth, and a considerable amount of the bismuth is amalgamated.

Two additional Pierce traps are placed at the tube-

IN TUL MI CHUNG VILLAGE

THE SUAN MILL, FROM THE RIVER

mill discharge, a small amount of quicksilver being added every half-hour to the tube-mill feed, the average amount being 6 oz. per 24 hours. Although coal-tar and lime are fed to the tube-mill, forming a certain amount of froth, this in no way appears to retard subsequent amalgamation in the Pierce traps, since the submerged portions of the amalgamated plates in the trap remain clean and bright. These tube-mill traps are removed and cleaned once every three days. Spare Pierce traps are kept, so that when one trap is removed from circuit to be cleaned, a clean trap is immediately inserted in its place.

The average recovery of gold by amalgamation in this mill is from 75 to 77% of the gold in the ore. The amalgam is caught as under:

| | |
|--|----|
| In battery, Pierce traps, and on apron-plates..... | 89 |
| In tube-mill and Pierce traps..... | 9 |
| Miscellaneous, launder, etc..... | 2 |

The amalgam recovered is 32% gold.

A considerable amount of vagrant amalgam finds its way into the table-concentrate. In order to recover this, and also to obviate the difficulty in obtaining close agreement between the mine and the smelter assays on samples of concentrate, caused by erratic gold assays due to prills of amalgam in the concentrate, the table-concentrate in recent years has been treated in an amalgamating barrel and pan. Not only was most of the amalgam in the concentrate recovered in this way, but also a portion of the fine gold in the concentrate that escaped amalgamation was thus saved. Owing to the amount of bismuth in the concentrate (3 to 4% bismuth) there is a relatively large loss of mercury in this operation and also the amalgam recovered is rather base, but the results obtained fully warrant our procedure, which not only increased the gold recovery by amalgamation but greatly reduced the number of discordant and 'spotty' assays on samples of smelter shipments. During 1918, the practice of amalgamating the concentrate in this manner had to be abandoned owing to the cost and difficulty of obtaining a sufficient supply of mercury under the war restrictions.

The amalgamating-barrel is 2 ft. diam. by 3 ft. long, revolved at 20 r.p.m. The amalgamating-pan is made of $\frac{1}{2}$ -in. sheet-iron, the bottom being part of a discarded Challenge feeder. The diameter of the pan is 3 ft. and the depth 9 in. A solid cast-iron ball, 8 in. diam., revolves in the pan, which is set at an angle in the manner of the Berdan pan. The pan has a speed of 20 r.p.m. A better plan would be to use a 4-ft. Berdan pan, taking concentrate direct from the tables with continuous overflow of treated concentrate into bins, and to clean-up the pan once or twice every shift. The loss of quicksilver in the barrel and pan amounts to from 5 to 8 ounces per ton of concentrate treated, depending on the percentage of bismuth in the product.

The total amount of quicksilver used in the mill averages 0.77 oz. per ton of ore milled. The loss in milling averages 0.1 oz. per ton of ore milled. The total quicksilver loss, including the loss in the treatment of concentrates, amounts to 0.27 oz. per ton of ore milled. The amalgam is retorted in the usual way. The gold is melted

into small bars, which are sampled, weighed, and then mailed to the Osaka mint.

CLASSIFICATION AND TABLE-CONCENTRATION. The pulp from the tail traps of each four batteries flows in one common launder to one Deister classifier with no spigot, but with a sufficient flow of clear water to keep the content in movement but not in violent agitation. This classifier has proved a most efficient amalgam trap, although, owing to the amount of water necessary to keep this heavy pulp from settling, some amalgam does escape. The pulp is then split, one-half going to a four-compartment spitz, made at the mine, and the other half to a launder classifier provided with four Deister classifiers. This arrangement has superseded the Callow cones and the two six-compartment Richards classifiers.

From 0.2 to 0.4 lb. of lime per ton of ore milled is added as milk-of-lime to the pulp coming from the batteries. The object is to assist in settling the slime overflowing from the classifiers, which discharge into Kyloe type of dewatering and thickening tanks.

The overflow from the classifiers is laundered to two Kyloe tanks. A description of these tanks is given in a paper by J. W. Ashcroft entitled 'The Flotation Process', read before the Institution of Mining & Metallurgy on December 17, 1912. The only modification in the design of the thickeners at the Suan mill from those described in the above-mentioned paper, is that baffles of ordinary corrugated roofing-iron are used in place of the plain baffle-boards described by Mr. Ashcroft, and also a small sloughing-off cone is placed immediately ahead of the Kyloe tank to cut out any heavy oversize that may have passed the classifiers at the battery. It has been found that the presence of this heavy oversize in the Kyloe tank gives trouble by plugging the spigot-discharge. The sloughing-off cone is 2 ft. 6 in. by 3 ft. with a $\frac{3}{4}$ -in. spigot. So long as the feed to the Kyloe tanks is only composed of slime, and the heavy sand is removed, these tanks are very satisfactory, the overflow from them consisting of nearly clear water. The thickening cones and Kyloe tanks are provided with quick-acting flap-valves to facilitate starting the plugged spigots with a minimum loss of pulp.

The thickened pulp from the Kyloe tanks and the sloughing-off cones goes direct to flotation.

The underflow from the classifiers is delivered to concentrating tables. Originally the mill was equipped with James tables throughout, but these were replaced by Deister sand and slime tables. These in turn were superseded by Deister plateau roughing and finishing tables (Deister Machine Co., large simplex table, 1914 model, speed 240 to 245 strokes per minute, stroke $\frac{5}{8}$ to $\frac{3}{4}$ in.), Wilfley sand-tables, (speed 240 strokes per minute, stroke $\frac{5}{8}$ to $\frac{3}{4}$ in.), and Card tables (type Hendrie & Bolthoff model C., 1914, with grooved linoleum decks, speed 245, 250, and 260 strokes per minute, stroke $\frac{3}{4}$, $\frac{5}{8}$, $\frac{1}{2}$, and $\frac{3}{8}$ in.; the shorter stroke and higher speed for the finer material). The Deister roughing and finishing tables are run at 245 strokes per minute, which speed, although not fast enough for this ore, seems to be the limit owing to the heavy weight of the table.

Originally the practice was to make two products from the tables by cutting out the rich streak at the head of the table as a high-grade bismuth-gold-copper-silver

contains from 60 to 100 dwt. gold per ton, 25 to 30% copper, 3.5 to 5% bismuth, and 6 to 10 oz. silver per ton. The average for 1918 was

| | |
|--------------------------|-------|
| Gold, dwt. per ton..... | 73.04 |
| Silver, oz. per ton..... | 9.07 |
| Copper, % | 27.47 |
| Bismuth, % | 3.40 |

The grade of ore milled during this year was below average and the above-quoted results for 1918, with the exception of the copper percentage, are in consequence lower than the usual grade of concentrate, especially as regards bismuth.

The recovery of copper by table-concentration is relatively low, since the main object is to produce the highest possible grade of concentrate to meet with the smelter requirements and a heavy transportation charge, and full reliance is placed on the flotation department to recover the greater portion of the copper that is not saved by table concentration.

The table-concentrate is sent to the drying-house, where it is dried, sampled, sacked, weighed, and sent to a smelter.

TUBE-MILLING. The tailing from table-concentration is laundered to a sloughing-off cone set so that the spigot delivers to a Dorr duplex classifier, at a point two feet ahead of the classifier overflow. The sloughing-off cone has the following dimensions: diameter inside annular launder, 3 ft. 4 in.; outside, 4 ft.; depth, 4 ft.; perforated diaphragm, 8 in. from the bottom; hole at bottom, 2 in., better if 2½ in.; hydraulic attachment consists of a 3-in. T-piece with 1-in. water-pipe and valves; feed-cylinder, 2 ft. deep by 18 in. diam. Iron plugs are inserted as spigots bored to varying diameters, ¾, 7/8, and 1-inch, and changed to suit variations in feed and the amount of plus 100-mesh oversize in the overflow.

The Dorr classifier is 15 ft. long by 4 ft. 6 in. wide, set at a slope of 2⅜ in. per foot. The classifier can handle the table-tailing when 30 stamps are dropping, but is overloaded with the whole 40 stamps in operation. We found that by increasing the speed of the classifier from 20 to 22 strokes per minute, it was able to handle the whole of the table-tailing without any overloading.

The spigot of the sloughing-off cone is adjusted so that a minimum of plus 100-mesh product flows off with the cone-overflow and a minimum of minus 100-mesh product is delivered to the classifier. The overflow from the sloughing-off cone goes to four 8-ft. Callow thickening cones, the thickened product from which goes direct to flotation.

There are two tube-mills, one being a spare. These are 5 ft. diam. by 22 ft. long, made by the Power & Mining Machinery Co. They are operated at a speed of 27 r.p.m. by a 50-hp. slip-ring Westinghouse A.C. type H.P. induction-motor, three-phase, 60 cycles, 440 volts, 575 r.p.m. It would be preferable to have a motor of greater capacity, say 70 hp., as when running at full load, especially with an increased pulp dilution in the mill, the motor is from 10 to 15% overloaded. Maximum grinding efficiency is obtained with a pulp dilution of 40% water. In practice, the average dilution is from 48 to

FIG. 2. REVOLVING SLOTTED DIAPHRAGM FOR DISCHARGE OF PEBBLE-MILL

product selling the remainder of the table-product on a non-bismuth basis. Later, this product was abandoned in favor of making a single table-product. This concentrate

50% water. The pebble load is maintained so as to keep the mill about half full. This is judged by the pebble feed, which is through the feed-scoop. Pebbles are fed every day to a point where the mill refuses to take more, that is, an occasional pebble drops back into the scoop from the charge.

The tube-discharge joins the classifier-overflow and both are pumped to two Pierce amalgamating-traps, 32 by 24 in. The discharge from these traps joins the tailing from the concentrating tables and flows to the sloughing-off cones above the Dorr classifier, thus putting the tube-mill, classifier, sloughing-off cones, and Pierce traps in closed circuit. The pump used for elevating the classifier-overflow and tube-mill discharge to the Pierce traps is a No. 1 Frenier pump, barrel 52 by 20 in., the discharge orifice is 3 in. diam., stand-pipe 4 in. diam., speed 19 r.p.m., height of lift 17 ft. 8 in., capacity 5000 gal. (U. S.) per hour. The energy required to operate this pump is from one to two horse-power.

As no payment is made for bismuth when the percentage of this metal in the concentrate falls below 1.8%, it is now proposed to further elevate the tube-mill discharge so as to join the feed of the concentrating tables, thus giving the re-ground material a second tabling, with the object of obtaining as much as possible of the bismuth in a marketable product.

In the early operation, the tube-mills were lined with imported five-inch silex bricks, and Danish pebbles were used for grinding. When the supply of foreign materials was practically cut off by the War, use was made of pieces of extremely hard ore, from the Suan mine, as lining. This material was dressed into blocks and proved almost as satisfactory and durable as the silex bricks, and was, of course, much cheaper. Cast (white) iron lifting-bars in sections 3 ft. long, 7 in. high, 1½ in. thick at base and ¾ in. at top, are inserted the full length of the mill between every two rows of lining-blocks, and this practice has greatly lengthened the life of the linings as well as increased the grinding efficiency. Such a lining has a life of from 8 to 12 months. With the depletion of the supply of hard mine ore for lining, blocks of a hard dolerite, which occurs close to the mill, have been used, and these dolerite blocks appear to give about as good service as the hard-ore linings.

A satisfactory substitute for imported pebbles was obtained from the beaches on some of the islands off the coast of Korea. The Korean pebbles, while not so good in shape nor so hard as the imported, gave a satisfactory grinding efficiency with a slightly heavier pebble consumption, the relative consumptions being 2 to 2½ lb. of imported pebbles per ton of tailing as compared with 3 to 4 lb. of Korean pebbles. The specific gravity of the imported pebbles is 2.59 and that of the Korean pebbles 2.65 to 2.70. Since the price of Korean pebbles delivered at the mill is only approximately one-quarter the price of imported pebbles, the former proved much more economical. Owing to the increasing difficulty and the cost of transport during 1918, and also a falling off in the supply of Korean pebbles, an efficient substitute has been found in 3 to 4-in. roughly dressed cubes of the hard

dolerite of which the mill-linings are now composed. The corners and edges of these dolerite blocks wear down quickly, when they form a satisfactory grinding pebble. They are much cheaper, of course, than either of the types of pebbles formerly used.

The lifting-bars in the mill-linings are not only of service in prolonging the life of the linings and increasing grinding efficiency, but also the tumbling action produced by the projections soon rounds off the corners of the dolerite blocks and produces a fairly well-shaped pebble. From an economic point of view the dolerite-pebble blocks give the best results, as with their use the increase in the mill oversize has been small.

The Suan ore is not so abrasive as the Tul Mi Chung ore, and the above-mentioned pebble consumptions are less than those obtained in grinding Tul Mi Chung ore in 8 ft. by 36-in. Hardinge pebble-mills. The following analyses give a general idea of the grinding results obtained in this mill.

| Mesh | | Typical Screen-Analyses | | Flotation feed |
|---------|-----|-------------------------|---------------------|----------------|
| | | Battery discharge | Tube-mill discharge | |
| On | 1 | 11.9 | ... | ... |
| " | 2 | 44.3 | ... | ... |
| " | 6 | 21.0 | ... | ... |
| " | 10 | 5.3 | ... | ... |
| " | 20 | 5.3 | 5.00 | ... |
| " | 28 | ... | 7.00 | ... |
| " | 35 | 4.0 | 7.00 | 3.75 |
| " | 48 | 1.3 | 6.00 | 3.00 |
| " | 65 | 2.2 | 8.00 | 6.00 |
| " | 100 | 1.3 | 10.00 | 7.00 |
| " | 150 | ... | 11.00 | 13.50 |
| " | 200 | 2.0 | 9.00 | 10.50 |
| Through | 200 | 1.4 | 37.00 | 58.25 |
| | | | | 68.00 |

Dolerite blocks for pebbles cost \$2.25 per ton delivered at the mill as compared with \$12.50 for Korean pebbles and \$47.50 per ton for imported pebbles. The average pebble consumption per ton of ore milled is as follows: imported pebbles, 2½ lb.; Korean pebbles, 4 lb.; and dolerite blocks, 5½ lb. per ton of ore milled.

CANVAS PLANT. The tailing from the cascade froth-trap goes to the canvas plant. This consists of 21 strakes each 30 in. wide and 50 ft. long, having a grade of one inch per foot, which is probably slightly too steep for the fineness and dilution of the pulp. The strakes are covered with 8-oz. canvas duck. As the tailing only contains approximately 5% oversize on a 100-mesh screen and as head-room is limited, no classification is made at the top of the canvas plant. The area of the canvas plant is not sufficiently large for the amount of tailing treated; probably it should be twice as much.

The concentrate saved in the canvas plant is of low grade. The former practice was to re-table it on a Deister slime-table and produce a separate product, but this was abandoned in favor of adding it to the Pierce traps at the battery and thus subjecting it to a complete re-treatment.

Thus the mill now produces only three products, namely, gold bullion and two classes of concentrate, that is, table concentrate and flotation concentrate. The part of the flotation concentrate is separated out as a high-bismuth product on a Card table. The gold bullion has an average fineness of 750. The concentrates produced have the following average grades:

| | Gold dwt per ton | Silver oz. per ton | Copper % | Bismuth % |
|---|------------------------|--------------------------|-------------|--------------|
| Table concentrate..... | 85.00 | 11.50 | 26.50 | 3.0 |
| Flotation concentrate..... | 25.00 | 4.50 | 27.05 | 1.4 |
| Card table bismuth concentrate from flotation..... | 130.00 | 20.00 | 42.00 | 0.0 |

TREATMENT OF OTHER ORES. The ores from some of the prospects on the Concession in course of development present sundry features of interest.

In stamp-milling it was found necessary to use finer screens than those in use for the Suan ore; so a 0.03-in. aperture screen was used. The extraction by amalgamation was 44.02% of the gold in the ore, this being relatively low but fairly satisfactory when the grade of the ore and the amount of bismuth is considered.

Concentration on tables at first produced a low-grade

The concentration of the bismuth into a marketable product was the main point in table concentration. It was also found possible to separate out a tungsten concentrate that can be chemically treated to separate the tungsten from the other metals by the method used on the mixed tungsten concentrate produced in the milling of the Socatarie tungsten ore to be mentioned hereafter. The flotation of the tailing from the tables was satisfactory, a good froth being produced without difficulty. The clean froth from the secondary machine was retabled on a Card table for the separation of a high-grade bismuth concentrate. Probably if the mill was arranged to operate entirely on this ore, improvement in the bismuth recovery would be possible by carrying out the re-

FIG. 3. DETAILS OF MADE-UP CRUSHER-JAW

product, owing to the large amount of magnetite. An arrangement for removing the magnetite was devised, with the result that practically all of it was eliminated from the concentrate. Card tables gave the best results on this ore.

The Peh Jai ore was treated at the Suan mill. This ore is quite complex and consists of a mixture of gold, silver, copper as chalcopyrite, bismuth sulphide, and scheelite, in an extremely hard gangue mostly composed of garnet and magnetite—a most refractory combination. The grade of the ore milled and the tailing produced are as follows:

| | Ore | Tailing | Extraction |
|-----------|-------|---------|------------|
| Gold | 1.50 | 0.05 | 96.67 |
| Silver | 10.00 | 0.10 | 99.00 |
| Copper | 1.00 | 0.02 | 98.00 |
| Bismuth | 0.50 | 0.01 | 98.00 |
| Scheelite | 0.20 | 0.00 | 100.00 |

| follows: | Ore \$ | Tailing \$ | Extraction % |
|---|-------------|---------------|-----------------|
| Gold per ton | 2.02 | 0.31 | 84.65 |
| Copper per ton at 20c. per lb. | 3.03 | 0.24 | 92.08 |
| Bismuth per ton at 65c. per lb. | 2.86 | 0.32 | 88.81 |
| Silver per ton at 75c. per oz. | 0.36 | 0.13 | 63.88 |
| Scheelite per ton at WO ₃ 75c. per lb. | 0.40 | 0.08 | 80.00 |
| Total | 8.67 | 1.08 | 87.54 |

concentration of the bismuth in steps and collecting the bulk of the bismuth in one product. No trouble was experienced in elevating the froth from the secondary-fotation machine, because this, after tabling, was completely broken down. If the mill was being run continuously on this ore, it appears that modifications in the canvas plant or possibly the use of Cornish rag-frames with glass surfaces would yield better results in bismuth and tungsten.

The products obtained in the milling of this ore were amalgam and four classes of concentrate of the following grades:

| grades: | Gold dwt. | Silver oz. | Copper % | Bismuth % | WO ₃ % |
|----------------------------|--------------|---------------|-------------|--------------|----------------------|
| Table concentrate | 254.4 | 12.04 | 1.53 | 17.89 | 14.52 |
| Flotation concentrate . . | 13.3 | 8.28 | 20.00 | 4.01 | |
| Middling | 28.4 | 12.06 | 1.63 | 5.74 | 9.59 |
| Flotation re-concentrate . | 86.0 | | 9.38 | 23.52 | |

The bulk of the other ores treated from the prospects

on the Concession have practically all their value in their gold and copper content; so that the treatment generally follows that of the Suan ore.

TUNGSTEN ORES. The main deposit of tungsten on the Concession is a large but low-grade band of silicified limestone, almost approaching a quartzite in composition. The ore-band, which is about 25 ft. thick, is mined cheaply by quarrying, and despite its extremely low grade it can be milled at a profit. As the deposit is situated close to the Suan mill, it is treated in this plant, which, however, is not particularly suited to the treatment of an ore of this character. A test-milling of 32,531 tons of this ore was made in 1916 and 1917, from the results of which certain modifications were introduced into the mill and on the closing down of the Suan mine the whole mill of 40 stamps will be operated on tungsten ore. The estimated tonnage to be treated monthly is 9000 tons and the estimated operating cost for mining and milling is \$2 per ton.

The average grade of the ore milled was: WO_3 , 0.3%; gold, \$0.45 per ton, and copper, 0.4%. On the results of the test-milling it is estimated that by producing a concentrate containing 20% WO_3 the following extractions will be obtained: gold 40%, tungsten 50%, and copper 25%. The low extraction of the copper is due to the fact that a considerable amount of it is present as oxidized mineral.

The main feature of the treatment of this ore is the production of tungsten in a marketable form. The whole of the tungsten produced in the former milling operations was concentrated up to a product containing from 60 to 65% of WO_3 . This concentrate, however, contained from 1 to 2% of copper, and also gold. Not only was no payment made for the copper and gold, but a heavy penalty was extracted from the tungsten price on account of the copper impurity. To produce a clean tungsten product an option has been obtained for the right to use a recently patented process for the separation of tungsten from mixed concentrate, and, after a great deal of experimental work at the mine, it appears that the practical operation of this process is possible. The products are tungsten tri-oxide containing about 98% WO_3 and a residue containing the copper and gold contents, which, after re-concentration, can be brought up to a marketable grade.

Although molybdenite occurs widely around the Contact, no profitable orebody has been discovered. The same applies to the lead-zinc ores, and also to a deposit of gold-bismuth-telluride.

THE POWER-PLANT of the company is situated at Pyeng Yang, some 55 miles from the Suan Concession. The plant is built on the south side of the Tai Tong river, below the railway-bridge and is about two miles from the centre of the city.

The supply of water is drawn from the river both for boiler-feed and condenser purposes, and has proved suitable. Some trouble is experienced during the high storm-water period in the summer, as well as in the winter from ice, but these troubles have not been serious. The gener-

ating station equipment consists of the following:

- 3 batteries each of two 225-hp. Heine water-tube boilers, provided with Heine superheaters and Babcock & Wilcox chain-grate stokers
- 2 steam-feed water-pumps
- 2 steam-feed water-heaters
- 2 steam-driven stoker-engines
- 2 1000-kw. Westinghouse-Parsons turbo-generating sets, with direct-connected exciters.
- 5 switchboard-panels
- 1 outgoing 44,000-volt electric-driven oil-switch
- 4 400-kva. transformers.
- 2 electric motor-driven surface-condensers
- 2 electric motor-driven intake-pumps

The transmission line from the power-house to the Concession is approximately 50 miles long. At Paa Mi Chang, about 34 miles from the power-house, the line divides, one line going 20 miles to Holkol and the other 16 miles to Tul Mi Chung.

The pole-line is constructed of wood and carries three No. 6 wires, with current at 44,000 volts, three-phase, 60 cycles. Sub-stations are situated at Tul Mi Chung and at Soctarie (for Holkol), where the current is stepped down to 440 volts for general use. For operating the air-compressors, the current is transmitted at 2200 volts to the compressor-houses at both mines and there stepped down to 440 volts. The air-compressors are driven by 210-hp. synchronous motors, which serve to balance the line-load.

Two batteries of boilers are sufficient to supply the steam for the operation of one of the turbo-generators and the other battery of boilers is held in reserve. Likewise only one of the turbo-generators is in use, the other being a spare in case of accident or repairs being necessary.

The whole plant is under the charge of experienced Japanese electrical engineers, and it is satisfactory to note that the operating time averages well above 98% full time.

FOUNDRY AND MACHINE-SHOPS. Owing to the situation of the mine and the distance from any large machine-works, the mills are provided with well-equipped machine-shops and a foundry. Thus the great bulk of all mine and mill repair-work is done on the Concession. Castings up to about one ton are made and all brass-work required is cast on the mine. During the last three years when the effect of war conditions resulted in difficulty and delay in obtaining any machinery parts, and prices for iron and steel in the Japanese works were enormous, the tendency at the mine has been to extend the scope of our own foundry and fitting-shops, which have turned out work at only a fraction of the Japanese cost. As a rule the work done at the mine is much superior to anything that could be purchased in Japan.

LABOR CONDITIONS. Although it is generally accepted in mining literature that cheap native labor is not economical, or at all events no more economical than higher-paid white labor, our experience in Korea and North China is that native labor is more economical than white

FIG. 4. DRYING-FLOOR IN TUL MI CHUNG MILL

labor. The outstanding factor of the mining and milling operations is the efficiency and economy of Korean and Chinese laborers, especially as miners, working at low rates of pay, namely, 25 cents per day for miners and 20 cents per day for coolies.

In many of the comparisons that have appeared in technical literature to show the relative efficiency of white and colored labor, the point does not appear to have been emphasized that, as a rule, such comparisons have been based on operating costs and results at mines where a comparatively large staff of white operators is employed for such work as handling explosives, underground timbering, engine-driving, pumping, and hoisting, whereas on the Suan Concession foreigners are only employed in small numbers to supervise work, and Koreans are entrusted with work that in most mines where native labor is employed is done by foreigners. Not only that, but many portions of our mine-workings are in charge of Korean shift-bosses who have proved with us, under proper supervision, as efficient as the average white shift-boss. The mining experience of some of these Korean shift-bosses is extensive and much of it gained in prac-

tically every foreign-operated mine in this country. Another point in favor of employing Korean shift-bosses is that it takes a foreign miner at least a year to pick up enough of the language and customs of the Koreans to prove his full usefulness. After a considerable experience in mining in oriental and tropical countries, we are convinced that, leaving out the language trouble, it is much more difficult to obtain men to handle native labor satisfactorily than it is to obtain men to handle white labor. For one thing, where white labor is employed there is, as a rule, ample opportunity to replace unsatisfactory men, while in the case of a mine working in a tropical country and employing colored labor, it is a matter of considerable expense and loss of time to replace an unsatisfactory imported shift-boss. In such cases too the maintenance of foreigners is costly as compared with their maintenance in white countries, and the cost to a mining company of employing a foreigner in, say, Korea, is more than the cost would be for the same man, say, in America. The tendency too of many white men is to fall off in efficiency in tropical and oriental countries. All of these features militate against good results being obtained in mines worked by native labor and have as a rule been put down to the inefficiency of the labor itself.

Our comparison of the relative efficiency of the average foreign shift-boss as compared with a Korean shift-boss, working underground under similar conditions, is largely based on detailed monthly mining cost-sheets prepared to show not only the final cost per ton of ore mined or per foot driven in each working-place in the mine, but also showing the details of the various items making up such a total cost. The stopes or workings entirely in charge of Korean bosses, under the general supervision of a mining foreman or his assistants, as a rule, show as cheap a cost as those in charge of foreign shift-bosses and are as efficiently worked. The Korean is a born miner, and the timbering and operation of some of the stopes on this Concession in difficult ground that are entirely in charge of Korean shift-bosses, with probably one visit per

shift from the mine foreman, would be a credit to any mine.

Besides Koreans, a large number of Chinese, mostly from Shantung in North China, are employed as miners. Probably the main difference between Chinese and Koreans is that while the Korean is a better miner as regards the following of ore and the timbering of workings, the Chinese is a harder worker and will make more money by mining on contract than a Korean, especially when hand-drilling in hard ground.

Both Chinese and Koreans make excellent machine-drill operators, blacksmiths, fitters, etc., and are quite efficient as engine-drivers, hoist-men, pump-men, etc. On the surface most masonry work, bricklaying, etc., is done by Chinese contractors, who as a rule employ Chinese crews. Carpenters are generally Japanese or Chinese.

GENERAL. The number of foreigners, mostly British and Americans, employed on the Concession is 31 and together with their families the whole foreign population on the Concession numbers 60.

Well-equipped hospitals are established at the two main camps under a foreign doctor, whose staff includes several qualified Korean doctors. All medical attention is free to all the employees; likewise a large number of Koreans and Japanese not connected with the company receive free medical attention. The annual cost of maintaining the hospitals and medical staff is \$8500 (the cost for 1918 being \$8670) and the number of treatments given during the last year was 30,570. The total number of treatments since the first hospital was built in 1909 to the end of 1918 was 203,834. The greatest difficulty the medical staff has to contend with is the absolute lack of sanitation among the Koreans and the indifference of the local authorities in this respect. Thanks to the vigilance of the medical staff, however, the mining camps on the Concession have been remarkably healthy, and, with the exception of a serious outbreak of influenza last year, epidemics have been few and not serious. The most common disease among the Koreans is caused by intestinal parasites, all the native patients examined being found to suffer from this complaint. It is of passing interest to note that Government statistics show that per year the casualties in Korea from attack by tigers, leopards, bears, wolves, and wild pigs were 129 killed and 105 wounded; besides 2839 cattle that were killed and 414 wounded.

At the two main camps clubs with a billiard-table, bowling-alley, and tennis-courts are provided. Living conditions are generally comfortable.

Korea now forms part of the Japanese empire and the local Government officials at the mine are mostly Japanese. Although the Government regulations are somewhat strict and great stress is laid on the carrying out of what appears from a foreign point of view to be unnecessary and at times tiresome details, the relations existing between the company and the local officials have been very satisfactory. There is a Government post and telegraph office at both main camps, and telegrams in English are accepted. All cash required at the mines is brought in through the post-office, which is a convenient arrangement.

The Concession is situated $42\frac{1}{2}$ miles away from the nearest railway connection and transportation forms a somewhat serious item in the operating cost. The roads are not good, especially in the wet season, when traffic is often held up by the bad condition of the roads. Practically all transport is by bull-cart.

The climate is good, although extremes of temperature are great. The winter climate is about similar to that of Denver. In the summer the maximum shade temperature reaches $90^{\circ}\text{F}.$, and, as the greatest heat is during the rainy season in July and August, it is oppressive. For the larger part of the year, however, the climate is dry and bracing; during spring and autumn it is ideal. The average rainfall is 40 inches, most of it from June to September. The snowfall is light, rarely exceeding six inches.

Manganese in Brazil

The richest mineral zone of Brazil lies in the heart of the Republic, in the State of Minas Geraes. The name Minas betrays both its past traditions and its hopes for the future. Gold, silver, iron, manganese, diamonds, or other precious stones abound in the central and north-western Provinces. At the present time, however, only a very small portion of the valuable beds of mineral is being worked. Doubtless existing unsatisfactory mining laws, as well as lack of fuel and transportation facilities, are responsible for this condition. Practically the only deposits being exploited at the present time are those of manganese situated near the railway lines. The largest of these is the Mina do Morro, which has played a prominent part in American industrial life during the War, when large quantities of this mineral were required for the manufacture of steel. Over a road ballasted with manganese, the train bearing the visitor climbs to the top of a mountain of manganese, where the actual process of mining the ore is visible. To the novice it appears to be nothing more than the digging or dynamiting off a hillside, crushing the blocks into pieces convenient for handling, and loading these on carts drawn by donkeys, which automatically walk to the dumps with their loads. No underground mining is done. A Brazilian firm owns this mine, which has been ably organized and operated for 17 years under its administration. The total invested capital is approximately \$600,000, two-thirds of the stock belonging to the above company. A total of 1,600,000 tons of manganese ore has already been exported in the history of the mine, and it is estimated that there is still in sight a total of about 10,000,000 tons, covering an area of 150 hectares, the average thickness of the manganese deposits being about 200 metres. The ore is 48 to 50% pure, although the percentage runs much higher in some cases. The exportation of 1917 was about 200,000 tons, and in 1918 about 300,000. With the close of the War there was a sharp drop both in the amount exported and in the price received for the ore. In the latter case the drop was about 50%. The labor conditions in connection with this mine are exemplary. In 1916 about 1000 men were employed.

A Calculator for Mine Valuation

By ROSS B. HOFFMANN

I have read in your paper on several occasions discussions on the use of various formulæ in the valuation of mines. The one most generally used, I believe, is that upon which the results on pp. 116-121 of 'Inwood's Tables' are based. It may be expressed by the equation

$$a = V \times (\text{redemption factor}) + V \frac{X}{100}. \text{ Equation I.}$$

This gives the annuity (or net yield per annum) a , which will yield $X\%$ per annum on the capital V and replace this capital at the end of n years by means of a sinking (redemption) fund accumulating at the rate of $i\%$ per annum.

The 'redemption factor' for any number of years n is the number representing the annuity that with compound interest i will at the end of the period amount to one unit of V .

When applied to the valuation of mines the equation may be re-written as follows:

$$a = Tp = V \frac{(X+S)}{100}. \text{ Equation II, where-in}$$

a = Net yield (earning) per annum.

V = Capital expenditure, present value, capitalization.

$\frac{X}{100}$ = Annual rate of interest paid on V .

$\frac{S}{100}$ = The redemption factor.

$\frac{X+S}{100}$ = Annual rate of net yield.

T = Number of tons, cubic yards, or other units of measurement, produced per annum.

p = Net yield per ton, cubic yard, or other unit.

Although simple in form, this equation for any given case requires a table of sinking-funds and considerable time to solve, and should we vary some of the quantities after the first calculation to study the general effect and determine roughly the limits of risk under which we are working, the operation of re-calculating with each variation becomes so tedious as to be neglected.

At your request, I shall describe below a scale, or calculator, designed by me for my own use to solve Equation II mechanically and rapidly.

Given any four of the quantities V , T , p , X , and S , the fifth may be quickly obtained from the scale.

THE CALCULATOR. The construction of the scale is simple and is best shown by the accompanying photograph, Fig. 1.

Purchase a 36-in. folding (Stanley) carpenter's rule with brass edges. With a ruling-pen, using black and orange inks, draw on a piece of accurately ruled cross-section paper (inches divided into tenths) the scales as shown. The width of the paper scale is that of the rule. With a thin coating of glue smear the side of the rule opposite the hinges and paste the scales on very carefully, making the inches on the paper correspond to those on the

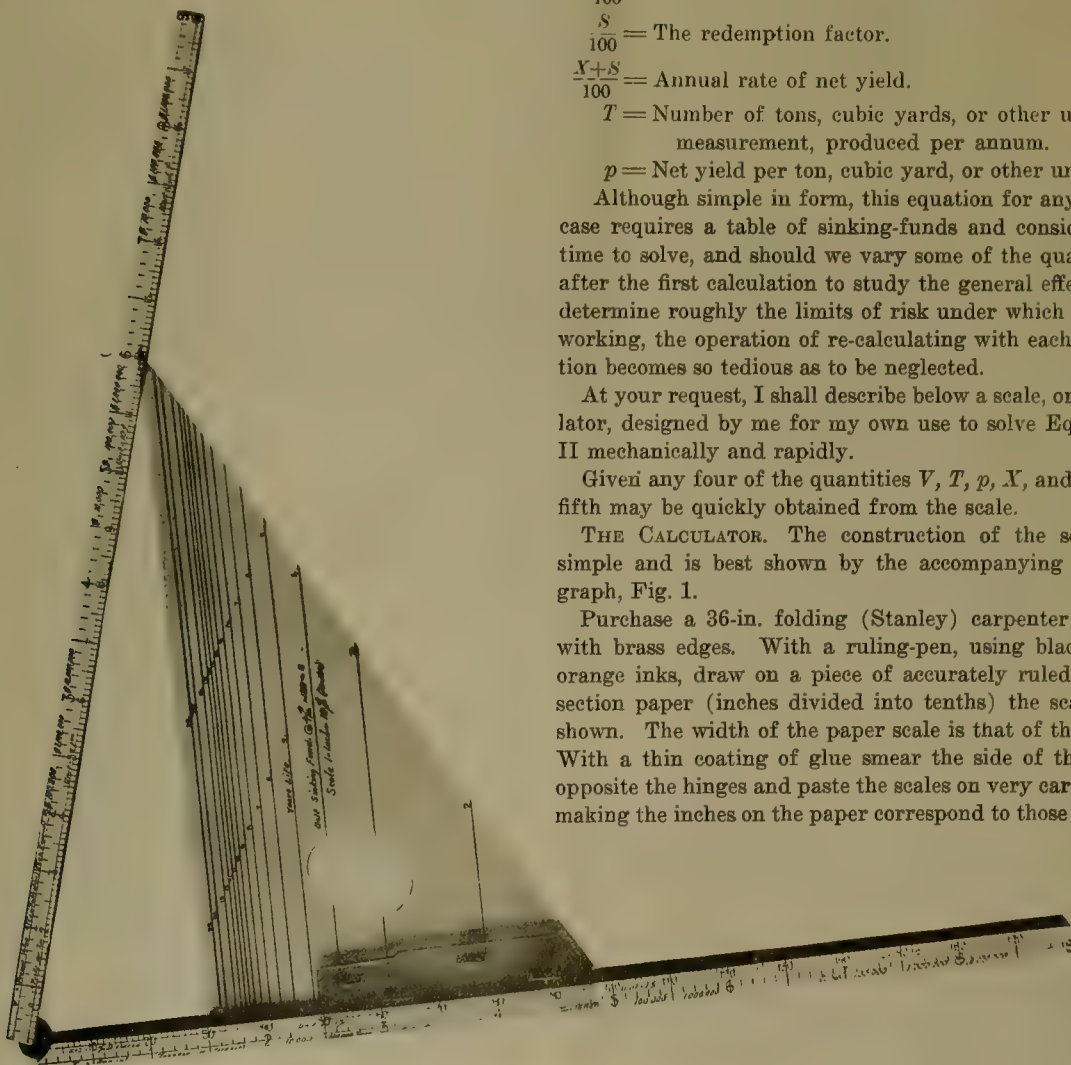

Fig. 1

rule. The zero of the scale is the centre of the circular hinge-joint of the rule.

Do not put glue on the paper scale, as it will stretch. It will also stretch if the glue is too thin and too thickly spread; slight inaccuracies in the calculations would thus be introduced. Cut the paper at the joints of the rule before closing.

Purchase a 20° or 30° right-angle celluloid triangle with the longest side 15 in. or more in length. With an architect's scale and a needle-point, lay off accurately for various numbers of years distances from this edge equal to S or 100 times the redemption factor. (See Inwood's, or any other standard, interest tables.) For convenience, these distances are tabulated below. The scale of measurement should be 1 inch = 10 units, the same as for the $X + S$ scale on the rule. The redemption factor may be chosen for any rate of interest desired; 4% is used below.

| Number of years | Corresponding value of S | Number of years | Corresponding value of S |
|-----------------|----------------------------|-----------------|----------------------------|
| 2 | 49.02 | 11 | 7.41 |
| 3 | 32.03 | 12 | 6.65 |
| 4 | 23.55 | 13 | 6.01 |
| 5 | 18.46 | 15 | 4.99 |
| 6 | 15.08 | 20 | 3.36 |
| 7 | 12.66 | 25 | 2.40 |
| 8 | 10.85 | 30 | 1.78 |
| 9 | 9.45 | 50 | 0.65 |
| 10 | 8.33 | | |

Next scratch lines by means of a sharp penknife and straight-edge through these points, parallel to the vertical edge of the triangle (on the under side when in the position shown in Fig. 1) and print upon each line the number of years represented thereby.

Fasten a cleat as shown on the triangle to hold it in place when in use. An ordinary paper-punch will make the holes through the celluloid, and paper-fasteners may be used for binding on the cleat.

Having completed the above, which any good draftsman should be able to do in a few hours, the calculator is ready for use.

THEORY AND USE. For convenience in construction of the scales Equation II was re-written as follows:

$$\frac{10T}{V} = \frac{(X+S)}{10p} = \cos j \quad (j \text{ is the angle between the arms of the calculator}). \quad \text{Equation III.}$$

The scales fixed upon the movable arms of the calculator are based on Equation III. All readings are taken at the radial edges of the movable arms.

For convenience in constructing the scales of the calculator, the unit of length for measurement of T and V was taken very different from the common unit of length for the measurement of X , S , and p . This does not destroy the relation expressed by Equation III, as is readily seen from the form of the equation.

For convenience also in the use of the calculator, the number representing the tonnage (or yardage) T is placed at the point on the scale representing in reality $10T$, and the number representing the net yield p per ton (or cubic yard) is placed at the point on the scale representing in reality $10p$.

If the cosine of the angle j between the movable arms be therefore set by the apparent relation $\frac{T}{V}$ or $\frac{X+S}{p}$ as read from the scales, the relation is in fact as shown in Equation III: $\frac{10T}{V}$ and $\frac{X+S}{10p}$. To set the angle whose cosine is $\frac{10T}{V}$ or $\frac{X+S}{10p}$ therefore, proceed in one of two ways:

1. Place the point on the radial edge of the upper arm of the calculator representing V vertically over the point on the radial edge of the lower arm marked with the annual tonnage (or yardage) T . The two scales involved here are ruled in orange.

2. Place in the same manner the point marked with the net yield per ton p vertically over that representing $(X+S)$. The two scales involved here are ruled in black to readily distinguish them from the others.

In any problem that might arise, the angle j is set by the use of one or the other pair of scales, as above described.

The placing of one point vertically above another as required above is accomplished by use of the celluloid triangle, which is made to slide on the radial edge of the lower arm of the calculator, its vertical edge, or any one of the parallel lines thereon, determining the required positions of the points.

As previously noted, the value of S for any given or assumed life is represented on the sliding triangle by the distance from its vertical edge to the vertical line upon which is printed the number representing this life. The unit of measurement being the same as that for the $(X+S)$ scale it follows that if we read $(X+S)$ with one of the vertical lines representing a definite life, then the vertical edge of the triangle gives the reading $(X+S) - S$ or X . Thus the per cent annual interest X may when desired be read directly from the $(X+S)$ scale.

The scales of the calculator having been once fixed on the movable arms, the quantities represented by the units thereof may be varied for convenience in working the great range of problems that fall within its scope, so long as these changes do not destroy the relations of Equation III. In order, however, that we may in all cases make use of the S scale, which is permanently scratched on the triangle, it is necessary that the unit of this scale be always the same as that of the $(X+S)$ scale and that the latter therefore be not changed.

Below are given in tabular form several groups of values for the units of the T and V scales corresponding to unit of $(X+S)$ scale (remaining unchanged) = 1% and unit of p scale equal \$1, 10 cents, and 1 cent respectively. The values for each group should be printed clearly on the scales in columnar form and correspond in such a way that when the values of the units in any one column are used simultaneously the relations of Equation III are not destroyed (see Fig. 2). Each scale is graduated on the decimal system.

If we take the net yield per ton (or cubic yard) expected as an index, whether in dollars, tens of cents, or

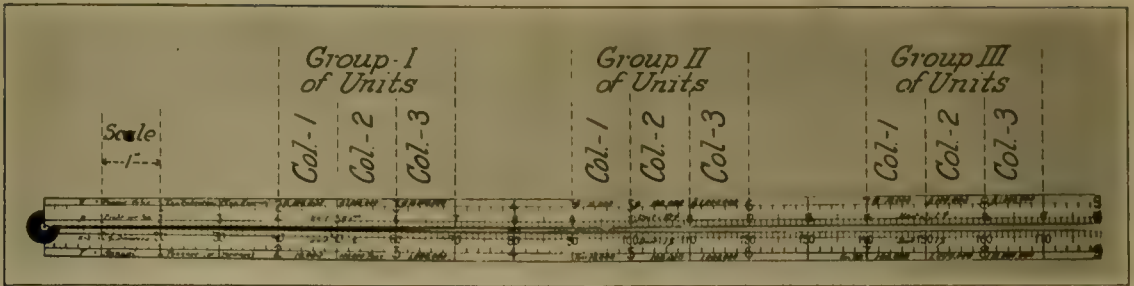

FIG. 2

cents, the corresponding group of unit-values may be chosen quickly and the proper column selected to meet the requirements of the particular problem.

1 unit of X and S on the scale = 1% = $\frac{1}{10}$ inch
" " " p " " " = 1 inch
" " " V " " " = 2 inches
" " " T " " " = 2 inches

The groups of units are as follows:

Group I of Units

| | Column 1 | Column 2 | Column 3 |
|-------------------------------|----------------|---------------|----------------|
| When the unit of | $p = \$1$ | $\$1$ | $\$1$ |
| And the unit of | $X + S = 1\%$ | 1% | 1% |
| Then for the unit of | $T = 10,000^*$ | $100,000^*$ | $1,000,000^*$ |
| The corresponding unit of V = | $\$100,000$ | $\$1,000,000$ | $\$10,000,000$ |

Group II of Units

| | | | |
|-------------------------------|----------------|-------------|---------------|
| When the unit of | $p = 10c.$ | $10c.$ | $10c.$ |
| And the unit of | $X + S = 1\%$ | 1% | 1% |
| Then for the unit of | $T = 10,000^*$ | $100,000^*$ | $1,000,000^*$ |
| The corresponding unit of V = | $\$10,000$ | $\$100,000$ | $\$1,000,000$ |

Group III of Units

| | | | |
|-------------------------------|-----------------|---------------|----------------|
| When the unit of | $p = 1c.$ | $1c.$ | $1c.$ |
| And the unit of | $X + S = 1\%$ | 1% | 1% |
| Then for the unit of | $T = 100,000^*$ | $1,000,000^*$ | $10,000,000^*$ |
| The corresponding unit of V = | $\$10,000$ | $\$100,000$ | $\$1,000,000$ |

*Tons or cubic yards.

The practical use of the calculator is best shown by solving a few typical problems.

PROBLEMS. Let the marks (x) below indicate the known or estimated quantities and the question marks (?) those whose value we wish to compute. Then five general problems suggest themselves as follows:

| Variables from the formula | Problem I | Problem II | Problem III | Problem IV | Problem V |
|----------------------------|-----------|------------|-------------|------------|-----------|
| p | x | x | x | x | ? |
| X | x | x | x | ? | x |
| Life | x | x | ? | x | x |
| T | x | ? | x | x | x |
| V | ? | x | x | x | x |

EXAMPLE OF PROBLEM I.

Assume:

$p = \$7$ (p being in \$ select group No. 1 of units on scale).

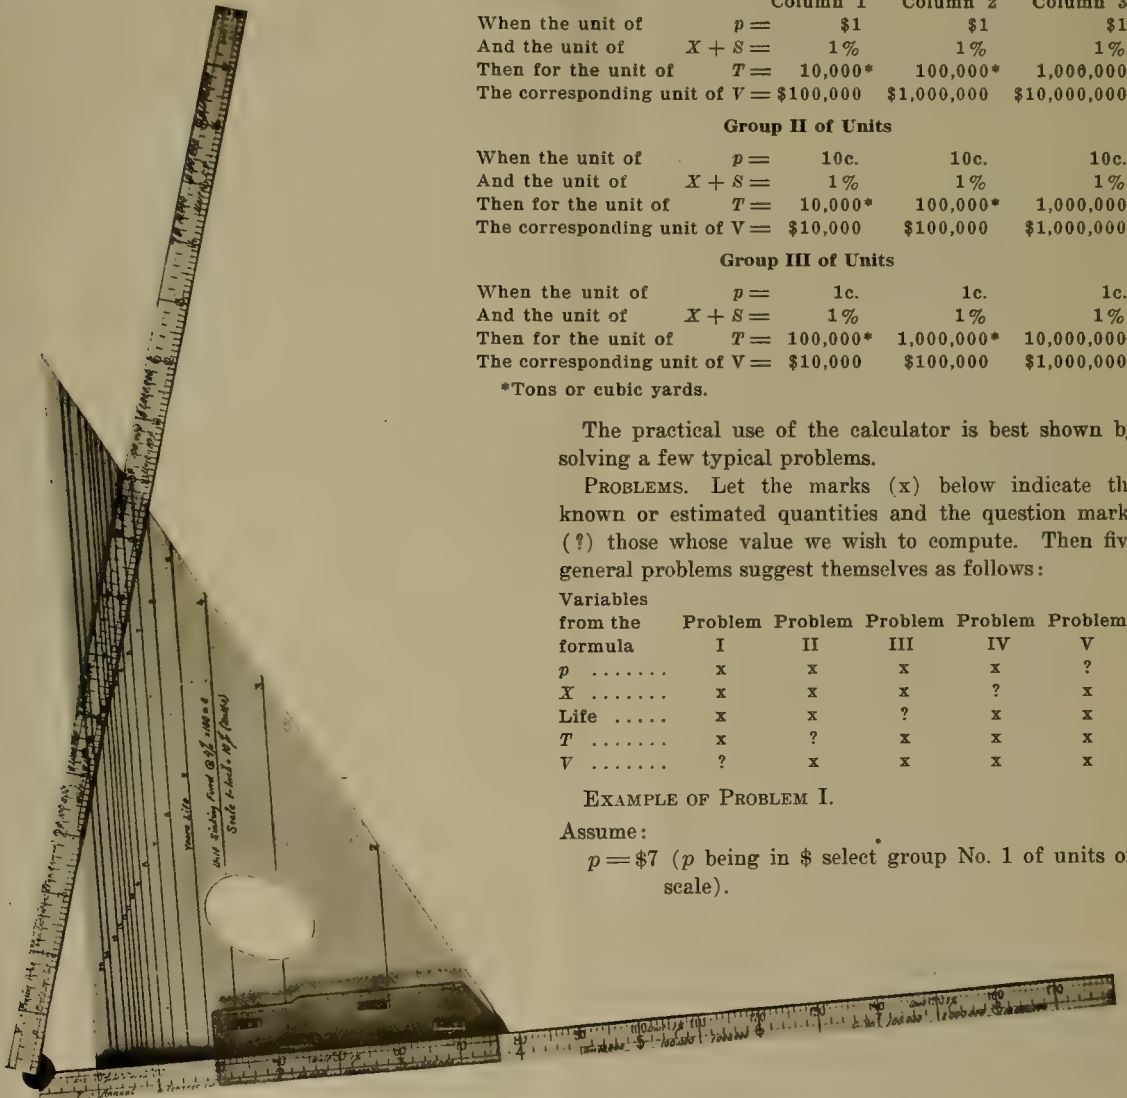

FIG. 3

$X = 10\%$.

Life = 10 years.

$T = 150,000$ tons per annum (T being in hundreds of thousands, select column 2 of units).

Required V .

Set the angle j between the movable arms by placing the point $X + S$ vertically under p , that is, with the vertical edge of the sliding triangle set at 10% , move the upper arm of the calculator until the 10 years life-line on the triangle passes through the point marked \$7 on this arm (see Fig 3). Next slide the triangle so that its edge marks 150,000 tons. The point vertically above this on the Present Value scale will be the required result, namely, \$5,730,000 (see Fig. 1).

For examples of Problems II, III, IV, and V, we may take any values for the known or estimated quantities and therefrom calculate the required results, but to illustrate the successive steps would require more photographs, such as represented by Fig. 1 and 3. We shall therefore use the same values as assumed or found in Problem I. The photographs will then suffice to show the successive steps in the use of the calculator and indicate for each problem the value of the required unknown quantity.

EXAMPLE OF PROBLEM II:

Set the angle as in Problem I. See Fig. 3.

Next slide the triangle so that its vertical edge marks the value \$5,730,000 for V .

The point vertically under this on the T scale is the required result, namely 150,000 tons. See Fig. 1.

EXAMPLE OF PROBLEM III:

Set the angle j by placing the given T (150,000 tons) vertically below the given V (\$5,730,000). See Fig. 1.

Next slide the triangle so that its vertical edge marks the given 10% . See Fig. 3.

The required life is that whose line passes through the given p (\$7), namely, the 10-year life-line.

EXAMPLE OF PROBLEM IV:

Set the angle j as in Problem III. See Fig. 1.

Next slide the triangle so that the known 10-year life-line passes through the given p (\$7).

The vertical edge of the triangle marks the required per cent X , namely, 10% . See Fig. 3.

EXAMPLE OF PROBLEM V:

Set the angle as in Problem III. See Fig. 1.

Next slide the triangle so that its vertical edge marks the given 10% .

The required p is that through which the given 10-year life-line passes, namely, \$7. See Fig. 3.

To illustrate further the value of the calculator in the analysis and study of any given problem, revert to the conditions of Problem I, for example. We shall assume that after a careful examination of a mining property the engineer has estimated the scale T (150,000 tons per

annum) on which the property shall be worked, its corresponding life (10 years), the net yield per ton \$7, and having taken $X = 10\%$ he has calculated V (\$5,730,000). The calculator would then be in the position of Fig. 1.

Without changing the angle j , we may now slide the triangle to the position such that the 10-year life-line cuts through the point on the scale representing \$5, instead of \$7. The edge of the triangle would show the corresponding value of X to be 4.8% . In other words, if V were fixed at \$5,730,000 and the actual working of the property should prove $p = \$5$ instead of \$7, as estimated, the venture as a whole, although not disastrous, would not have been very profitable. If, in addition, however, the life should prove only 7 years, instead of 10 years, then by sliding the triangle so that its 7 years life-line passes through the \$5 point, the corresponding percentage X would be only a small fraction of 1% , which would show a condition disastrous to the investor.

The engineer, after considering all the evidence and facts and weighing all possible risks, may have decided at the outset that the probable values for p , T , and the life of the mine would be as stated in Problem I; that under very unfavorable conditions the value of p might fall to \$5, and that the minimum estimate for life would be 7 years, and that assuming these most unfavorable possibilities to materialize he would require at least 6% per annum interest on V with the return of V at the end of 7 years. Then, assuming these unfavorable conditions, we set the angle j of the calculator using $X = 6\%$, life = 7 years, and net yield per ton \$5, and find vertically over the 150,000 annual tonnage the present value, or allowable capitalization \$4,020,000.

Taking this value for V and 150,000 for T and assuming that upon working the property not the minimum values, but the estimated probable values for p and the life should prove correct, then without changing the angle j of the calculator, we slide the triangle to the position corresponding to $p = \$7$ and life = 10 years, and read $X = 17.8\%$.

In the original problem then, if X were put at 17.8% instead of 10% , the corresponding value of V would be \$4,020,000 instead of \$5,730,000, and the investor would receive somewhere between 6% and 17.8% on his money V , with the return of V at the end of the life of the mine, so long as the values of p and of the life do not fall below the minimums nor above the 'probable values' estimated. Such an investment might be considered reasonably safe.

The above calculations constitute ten separate problems. The time required with the calculator to solve all ten should not be over 10 minutes. The units used were those of Group I, column 2.

As a further example in the use of the calculator, assume a dredging proposition:

Cost of 7-ft. dredge, property, etc., say, \$350,000 = V .

Cubic yards of gravel per annum, 1,000,000 = T .

Net yield per cubic yard, 7c. = p .

Life, 10 years.

Required per cent annual interest, X .

Solution: The net yield being in cents per cubic yard and the output in millions of cubic yards, select the units of Group III, column 2.

Set the angle j by placing the given T 1,000,000 cu. yd. vertically under the given V (350,000).

Next slide the triangle so that the 10-year life-line passes through the point marked 7 cents and read at the vertical edge of the triangle the value of X , namely, 11.7%.

Next assume a coal property:

Tons per annum, 1,500,000.

Life, 25 years.

Profit per ton, 0.70.

X (assumed), 15%.

Required V (present value).

Solution: The profit being in tens of cents and the output in millions of tons, select the units of Group II, column 3.

Set the angle j by placing the given profit \$0.70 vertically over the point corresponding to 15% and 25 years life. Next slide the triangle so that its vertical edge marks 1,500,000 tons and read on the scale vertically above the corresponding value V , namely, \$6,030,000.

Many other forms of problems present themselves, all of which may with a little practice be readily and quickly solved on the calculator.

The calculator in the form shown in Fig. 1 and 3 is crude. If constructed by an instrument-maker equipped with proper machinery, the scales could be easily halved, making the length of arms 10 inches instead of 18 (they should properly be 20) and the triangle could be replaced by a better form of sliding scale.

WORK on the topographic and geologic atlases of the country is carried along by the U. S. Geological Survey as rapidly as means are provided for the field work and for preparing and printing the maps. The Survey's geologic map work is of two kinds, one consisting of special surveys and researches directed to immediate economic results—such as explorations for new oilfields or examinations in mining districts—the other consisting of systematic geologic mapping of the country by rectangular areas called quadrangles, the geology of a quadrangle or a group of adjacent quadrangles being made the subject of a geologic folio. Over 200 geologic folios have now been published, and the latest to appear (Folio 209) is one covering the Newell quadrangle, named from the town of Newell, in western South Dakota. The south-east corner of the area mapped is crossed by Belle Fourche river. The folio describes the geography and geology of the area and its economic resources, including underground water. It contains a topographic and a geologic map and a map showing areas in which flowing artesian water may be obtained at depths that are indicated. A sheet of halftone views shows some characteristic features of the country, among them what are called teepee buttes, steep-sided conical buttes 100 ft. or more high. This folio may be obtained for 25 cents on application to the Director of the U. S. Geological Survey, Washington, D. C.

Cost of Copper Production

A forward step toward the standardization of copper production-costs was taken during the Government's war-time control of the metal prices, although the methods adopted at that time were not in strict accord with the general ideas of mining companies' managements. It was ascertained, as a result of this standardization, that the average cost of 85 companies for the year 1918 was 16.167c. per pound. The range extended from below 12c., where two companies turned out over 122,000,000 lb. jointly, to over 34c., above which level five small concerns produced approximately 7,000,000 lb. Several small Michigan companies, which came into being during the regime of high prices, were the highest cost properties, as five of them, contributing in all 6,975,960 lb., had an average cost of 34.614c. per pound, thereby showing a big loss from the fixed prices of 23½ and 26c. The largest companies as a rule were the cheapest producers. The average of the porphyry group for 1918 was 14.886 cents.

The allocation of production of copper in 1918 according to cost per pound may be found in the following compilation of the Federal Trade Commission:

| Range of cost | Number of companies | Production, lb. | Total % |
|------------------------------|---------------------|-----------------|---------|
| Cost less than 12 cents | 2 | 122,245,051 | 5.41 |
| Cost between 12 and 13 cents | 4 | 208,571,191 | 9.24 |
| " " 13 " 14 " | 4 | 314,553,177 | 13.93 |
| " " 14 " 15 " | 4 | 359,617,743 | 15.92 |
| " " 15 " 16 " | 2 | 98,307,293 | 4.35 |
| " " 16 " 17 " | 8 | 460,528,645 | 20.39 |
| " " 17 " 18 " | 9 | 255,399,696 | 11.32 |
| " " 18 " 19 " | 3 | 72,373,388 | 3.20 |
| " " 19 " 20 " | 5 | 28,491,436 | 1.26 |
| " " 20 " 21 " | 5 | 36,871,193 | 1.63 |
| " " 21 " 22 " | 9 | 135,538,602 | 6.00 |
| " " 22 " 23 " | 3 | 60,861,465 | 2.70 |
| " " 23 " 24 " | 5 | 44,919,772 | 1.99 |
| " " 24 " 25 " | 1 | 6,230,694 | 0.28 |
| " " 25 " 26 " | 3 | 7,605,224 | 0.34 |
| Cost over 26 cents | 18 | 46,119,555 | 2.04 |
| Total all companies | 85 | 2,258,234,125 | 100.00 |

The above figures include companies that buy and sell ores, so that there is a duplication of 63,700,000 pounds.

Up to the year 1917, few companies reported depletion as a cost; whereas practically all companies now include such a charge, based on the re-valuation of their mineral land. This is one of the largest single factors accounting for the increase in the cost of producing copper in the last year or two. Depreciation appeared on the books of mining companies at about the same time as depletion and for the same reason. Unfortunately, the rates are not based on the life and residual value of particular assets, but are more often arbitrary amounts based sometimes on what will be allowed as deductions on tax reports and sometimes on the best judgment and opinion of officers or directors.

The commission has not attempted to equalize depreciation for the various companies, usually accepting the depreciation charges as made by the company. In some instances, however, the cost of shafts, tunnels, openings, and underground equipment charged to cost in prior years has been set up on the books and depreciation again charged into cost. The commission did not allow depreciation of this nature, the amounts in any case being but small.

Mineral Production in British Columbia

STAFF CORRESPONDENCE

One of the mining engineers in the service of the Provincial government, in commenting on the progress of the mining industry in British Columbia during 1919, observed that, from the viewpoint of production, it was a period of 'marking time'; but, if looked at with an eye to the future, it had been one of the most eventful and encouraging twelvemonths in the history of the Canadian North-West.

This rather accurately sums up the situation. From figures available from the various producing properties, there can be no question of a distinct shrinkage in the output of most of the chief economic metals. It is possible that the estimates made of the production from the last date on which authentic statistics were to be obtained to the end of the year, will be proved at fault. Consequently it is possible that final information will indicate some increase in the present estimates of the production of gold, silver, copper, and lead.

The world's market conditions as compared with those of the previous year have been, of course, responsible, in a large degree, for the 1919 results. These, however, were augmented by local occurrences which retarded production. The Phoenix copper mines and the Grand Forks smelter were closed entirely by the Granby Consolidated Mining & Smelting Co. some months ago. To this may be added that the same company, the largest copper producer of the Province, owing to labor troubles and for other reasons, is estimated to have turned out nearly 10,000,000 lb. less at its Anyox plant. When the War ended the Consolidated Mining & Smelting Co. had a surplus of lead so that it is not surprising that a material drop in the quantity of the output is indicated. There is some satisfaction, under the circumstances, in being able to show that the East and West Kootenays, evidently, have passed the 1918 mark, substantially, in regard to the zinc output. It is to be noted, however, that the Sullivan Mines Co., the greatest single zinc producer of the Province, still is limping along as the result of a strike of its miners.

With reference to the precious metals, while the future outlook is bright as to silver due to the opening of the Salmon River section of the Portland Canal district, where the Premier mine is situated, the returns thus far received do not reflect the general revival of interest in all properties producing this metal. The chief cause of this is found in the situation in the Slocan mining division, where the Standard, to instance one of several properties, has ceased shipping silver ore. The withdrawal of this large producer, and of others of the area, from the actively producing class has not been neutralized by the contributions of the new northern section, or by those of scattered but numerous small shippers. Many of these are starting in a small way throughout all the mining districts, the incentive, of course, being the high price of

silver. The handicap confronting those engaged in gold production elsewhere, applies with equal force in British Columbia, although, notwithstanding high costs, more placer ground is being taken up in the Cariboo and in little-prospected parts of the far north, and there is lode mine development under way of a promising nature in several districts.

Obviously 1919 has not been a record breaker as to production. It has, however, been exceptional in the interest displayed in mining; in the development that has been initiated with splendid results; in the discovery of a new mineralized zone having good possibilities; and in the encouragement which the year's achievements have given all interested in the industry. The fact that the production seems to have dropped is forgotten in contemplation of the sure foundation that is being laid for the future.

Following is a comparison of the production, from the six districts of the Province, for the years 1918 and 1919, figures for the latter year being estimates of the Government's district engineers.

No. 1—Comprising the divisions of Bella Coola, Queen Charlotte, Skeena, Portland Canal, Naas River, Atlin, Stikine, and Liard. George A. Clothier, engineer

| | 1918 | 1919 | Comparison |
|--|------------|------------|------------|
| Gold (placer), Atlin and Liard divisions | \$219,000 | \$189,000 | \$30,000† |
| Gold (lode), ounces | 47,993 | 59,729 | 11,736* |
| Silver, ounces | 415,280 | 905,685 | 490,405* |
| Copper, pounds | 30,198,782 | 20,870,885 | 9,528,097† |

No. 2—Comprising the divisions of Omineca, Quesnel, Cariboo, and Peace River. J. D. Galloway, engineer

| | 1918 | 1919 | Comparison |
|----------------------|---------|---------|------------|
| Gold, ounces | 5,385 | 5,700 | 315* |
| Silver, ounces | 84,125 | 90,000 | 5,875* |
| Lead, pounds | 123,568 | 100,000 | 23,568† |
| Copper, pounds | 643,843 | 12,000 | 631,843† |
| Zinc, pounds | 313,112 | 300,000 | 13,112† |

No. 3—Comprising divisions of Clinton, Lillooet, Kamloops, Ashcroft, Nicola, Vernon, and Yale. R. W. Thomson, engineer

| | 1918 | 1919 | Comparison |
|--------------------------------|------------|---------|------------|
| Gold, ounces | 3,288 | 3,200 | 88† |
| Silver, ounces | negligible | 6,600 | 6,600* |
| Copper, pounds | 531,000 | 520,000 | 11,000† |
| Magnesium sulphate, tons | 150 | 650 | 500* |

No. 4—Comprising divisions of Grand Forks, Osoyoos, Greenwood, and Similkameen. P. B. Freeland, engineer

| | 1918 | 1919 | Comparison |
|-----------------------|-----------|-----------|------------|
| Gold, ounces | 53,654 | 33,000 | 20,654† |
| Silver, ounces | 227,244 | 203,000 | 24,244† |
| Copper, pounds | 9,940,125 | 3,990,000 | 5,950,125† |
| Lead, pounds | 47,738 | 34,500 | 13,238† |
| Fluorite, tons | 170 | 650 | 480* |
| Limestone, tons | 2,000 | 16,300 | 14,300* |

No. 5—Comprising the divisions of Golden, Windermere, Fort Steele, Revelstoke, Lardeau, Alnsworth, Slocan, Slocan City, Trout Lake, Nelson, Arrow Lake, and Trail Creek, generally referred to as the East and West Kootenays. A. G. Langley, engineer

| | 1918 | 1919 | Comparison |
|----------------------|------------|------------|-------------|
| Gold, ounces | 51,020 | 35,771 | 15,249† |
| Silver, ounces | 2,650,918 | 1,945,982 | 704,936† |
| Lead, pounds | 43,728,355 | 17,669,970 | 26,058,385† |
| Copper, pounds | 1,685,290 | 1,354,130 | 331,160† |
| Zinc, pounds | 41,459,804 | 43,349,700 | 889,896* |

No. 6—Comprising the divisions of Alberni, Clayoquot, Qatsino, Nanaimo, Victoria, Vancouver, and New Westminster

| | 1918 | 1919 | Comparison |
|----------------------|------------|------------|------------|
| Gold, ounces | 5,565 | 3,200 | 2,365† |
| Silver, ounces | 116,425 | 110,000 | 6,425† |
| Copper, pounds | 18,475,013 | 20,000,000 | 1,524,987* |

Grand Total for Province

| | 1918 | 1919 | Comparison |
|----------------------|------------|------------|-------------|
| Gold, ounces | 180,674 | 150,050 | 30,624† |
| Silver, ounces | 3,498,172 | 3,261,267 | 236,905† |
| Copper, pounds | 61,483,751 | 46,546,815 | 14,936,936† |
| Lead, pounds | 43,899,664 | 17,804,470 | 26,095,194† |
| Zinc, pounds | 41,772,916 | 43,649,700 | 1,876,784* |

*Indicates increase. †Indicates decrease

FROM OUR OWN CORRESPONDENTS IN THE FIELD

ARIZONA

UNITED VERDE TO MINE 'BURNING' STOPES.—SMELTER CAPACITY INCREASED.

COURTLAND.—The Leadville Mining Co., of which William Holmes is manager, has discovered excellent ore on the 300-ft. level of its No. 2 shaft. The body was encountered 300 ft. from the main shaft about a month ago, but nothing was said by the management until it could be explored. When two parallel drifts 50 ft. apart had been driven into the orebody for a distance of 80 ft. without striking the hanging wall, Mr. Holmes announced the discovery to stockholders. He also said that the company would be able to pay its first dividend shortly after January 1. This discovery at the Leadville, coupled with the recent announcement of favorable development by the Great Western company, has caused confidence in the future of the camp. Ten years ago there was an historic rush to Courtland, but when public utilities had been established and all preparations for a large camp made, the boom died. The C. & A. company has twice done considerable work on it under bond.

GLOBE.—The Gibson company is producing about 11 tons of concentrate per day in its new mill. Much of the work is done by Apache Indians. The Superior & Boston company has chosen as directors Garrett Mott, J. B. Hardon, W. F. Fitzgerald, J. F. Barry, and T. R. Drummond. Officers will be elected at a board meeting in Boston. Shipments are being made from a copper vein 4 ft. wide on the 400-ft. level, containing 24% copper and 92 oz. silver per ton. Drifting is being done on the vein in both directions. The company is drilling below the 1200-ft. level to pick up extensions of known orebodies. Diamond-drilling is to be started soon on the Louis d'Or property north of Inspiration. A mill is planned. A New York company is operating the Princess Pat property in Graham county, 18 miles south-east of San Carlos. The mine is under bond from G. M. Allison of Stanley, and O. W. and J. S. Allison of Globe.

JEROME.—The United Verde Copper Co. has started its long planned attack upon the old burning sulphide stopes which have been smoldering for more than 20 years and have defied all efforts to extinguish them. The plan is to use enormous steam-shovels to remove the ready-made calceines which will be hauled in steel hopper, broad-gauge cars, and dumped direct into the reverberatories at the company smelter at Clarkdale. The shovels already are at work excavating for the new mine power-plant and

surface buildings; 14,000,000 cu. yd. of material will be gouged out of the face of the Black Hills range. All waste will be used to fill ravines. A winding railroad has been built on a 4% grade up the mountain. This road has been under construction for two and a half years and in addition to serving the mine will serve the people of Jerome. At Clarkdale the United Verde smelter has already doubled its capacity, though the improvements are not yet complete. Former Senator W. A. Clark realizes that no increase in present production is wanted, but he foresees a great demand for copper. Six reverberatory furnaces of larger type than those now in use have been added. Twelve new roasters, of greater capacity than the old ones, have been built. Other improvements include installation of two Great Falls converter stands and eight new Sterling boilers. Two special features worthy of mention are the use of powdered coal as fuel for reverberatories in place of fuel oil, which of late has proved very expensive. Gallup semi-bituminous coal is stored under water until needed, as it is quite susceptible to spontaneous combustion. Before using it is crushed, dried, and then pulverized until it can be sifted through a 100-mesh screen. It is then ready to be taken by air-blast and blown into the 100-ft. reverberatories. A smoke-treating plant operated under 125,000 volts catches and deposits all metal particles. The smoke-treating plant will cost \$75,000, but great results are anticipated from it.

CALIFORNIA

NEVADA COUNTY NOTES.

NEVADA COUNTY.—The Red Ledge mine at Washington, famous as a producer of specimen quartz and leaf gold, owned by Bruce and Foster Williamson and Clyde Cole, has been bonded to P. R. Kelsey of Quincy, Plumas county. Operations have already commenced under the management of Lewis Hind. The bonded price has not been made public. The property embraces several claims but no development work has heretofore been attempted. The Grass Valley Chamber of Commerce has placed its mineral cabinet in the lobby of the Bret Harte hotel, considering that place the most advantageous for display purposes. An appeal has been made to the mining public for more specimens of ores either as gifts or loans. The mineral rights under the property of Mrs. B. K. Wood have been sold to the Empire Mines & Investment Co. A probable offshoot of the Woodville vein has been encountered by the Boundary Gold Mines Co. after sink-

ing for several months. This presumed offshoot, though narrow, shows free gold in abundance. The company owns nearly 40 acres in which are included the Woodville, Gamblers, Cabin Flat, Upper Scadden, and part of the Peabody claims. There is a theory among the old-timers that deeper workings in the main shaft might solve the mystery of the continuation of the Gold Hill mine gouge, which at a depth of 350 ft. produced some \$7,500,000. No trace of a continuation of the vein has yet been found, although large sums have been expended in a persistent search in adjoining mines.

COLORADO

PROFIT FOR UNITED GOLD MINES CO.—DEVELOPMENTS AT CRESSON MINE.

CRIPPLE CREEK.—With their lease expiring on December 31, Anderson and Benkelman, lessees operating the Trail mine, through the Dexter shaft, on the southern slope of Bull hill, are producing at a rate never before witnessed from a Cripple Creek lease. In 11 days in December, 18 cars of ore were shipped to the Golden Cycle mill at Colorado Springs, and settlement netted the lessees \$24,965. The United Gold Mines Co. was paid in royalties \$8788 and 1% was further deducted in taxes, making the total value of the 18 cars \$34,500. The lease, it is understood, will not be extended and the property, controlled by A. E. Carlton, will be operated on company account. The United Gold Mines Co. will pay a dividend of 1c. per share on January 15, to stockholders of record of December 31, and with a substantial treasury reserve it is expected the company will go on a quarterly dividend-paying basis. All of the interested parties in the lease have taken out fortunes and at a rough estimate the lease has cleared \$1,000,000. The property adjoins the Cresson mine and the company for some months has been operating from the 1000-ft. level of the Cresson, and is reported to have opened good ore.

Ore-reserves of the Cresson mine are estimated by Charles Noble, consulting engineer, at \$1,934,158. Cash in bank is \$219,000, with ore in transit and at the mill with an estimated value of \$70,000 exclusive of December shipments. The report of A. L. Bloomfield, general manager, shows that during the past fiscal year 19 diamond-drill holes totalling 3667 ft. were drilled. Good ore was disclosed which, according to the general manager, "may result in the discovery of a continuation of the ore" under stope 1203.

The new orebody opened up on the Buena Vista vein, on the Cheyenne claim, Isabella Mines Co., by the Wilson lease has developed into a strong shoot and two cars of the ore shipped assayed more than 2 oz. gold.

At the annual meeting of the Free Coinage company, held this week, J. B. Neville was elected president and treasurer; A. L. Neville, vice-president and secretary; and A. V. Hunter, director. The company's estate adjoins the Isabella group on Bull hill and is being operated under lease. Production from the Free Coinage group, mined above the 750-ft. level, has been in excess of \$2,000,000.

LEADVILLE.—Operations have been resumed at the 'A. V.' mine, after a shut-down of about six months, by M. L. Buchanan and others. The property, located at the head of Harrison avenue, is a producer of manganese ore.

Work on the Canterbury Hill tunnel project will, it is expected, be started in earnest the first of the new year. A small force has already been employed making necessary repairs. Leases have been secured on properties to be traversed by a tunnel which will explore the south end of Prospect mountain.

George Creamer and associates, operating the Hagerman shaft on the Carbonate mine, and adjacent ground owned by the Stars Mines Co., are mining a good grade of ore from their lease and will shortly start shipping.

Smelting ore is being shipped by Cortellini and Zadra from the Blain shaft on Pryor hill. The ore is a high-grade carbonate treated at the Leadville smelter of the A. S. & R. Co.

MICHIGAN

NEW DEVELOPMENT AT THE MAYFLOWER.—CALUMET & HECLA OUTPUT.

HOUGHTON.—The most interesting development in this district is that at the Mayflower-Old Colony property. Following a program laid out some years ago the shaft on December 11 cut into an amygdaloidal formation containing copper, at a point 1670 ft. from the surface. Possibilities warrant lateral opening, after which the shaft will be continued. On account of the fact that it is so far east and so close to the sandstone the Mayflower has been considered as lying outside of the ore-zone. It is, of course, too early to even conclude that the work is going to result in another paying copper mine in the Lake Superior region, but the whole Michigan district is watching the results with interest. The shaft, as well as the drill cores, proves that the entire area has been badly shattered and that the veins have to a large extent flattened out.

After a month of waiting the Seneca company finally has been given a rate for railway transportation so that it may carry its copper ore from the mine dump to the Baltic mill and shipments have been commenced. It is believed that the ore will produce 40 lb. refined copper per ton, or about twice the quantity in the ore from the Mohawk and Ahmeek shafts.

The total output of the Calumet & Hecla company and all its subsidiaries for the present year is estimated at 102,500,000 lb. of copper. The actual production of the Calumet & Hecla group for the first 11 months was 92,981,722 lb. The total for November was 9,498,756. From these figures it is certain that the net output for the whole Lake Superior district will be the lowest in 30 years, not even excepting the production of 1913 and 1914 when the strike made a great difference. The November production from the Calumet & Hecla properties follows: Ahmeek, 1,604,600 lb.; Allouez, 328,100; Calumet & Hecla, 5,056,926; Centennial, 101,000; Isle Royale, 1,260,573; Osceola Consolidated, 904,714; and White Pine, 242,843 pounds.

MONTANA

ANACONDA COMPANY RESUMES.

BUTTE.—The copper mines of the Anaconda Copper Mining Co. and the North Butte Mining Co. resumed work on Monday, December 22, after a shut-down of four weeks due to the coal strike. About 7000 men were given work by the re-opening of these properties. The Anaconda company also resumed operations on December 20 at their zinc-silver producing mines, the Emma and the Nettie. These mines have been shut-down since February when a general curtailment in the Butte mining district was put into effect. The ore produced will be shipped to

T. A. Rickard, W. J. Loring, Albert Burch

AT THE PLYMOUTH MINE, AMADOR COUNTY, CALIFORNIA

the Great Falls smelter, which was recently opened after a shut-down of 8 months.

The North Butte Mining Co. is still pursuing active development from the Sarsfield shaft on their east side properties. They are also pushing clean-up and development operations at the BIRTHA shaft. This shaft, situated in the copper silicate and carbonate zone just north of the Butte and Bullwhacker mine, has been re-timbered to the 90-ft. level. An air-compressor and air-hoist have been put in and a 100-ton ore-bin is under construction. The road to the mine will be put in shape and it is expected that the property will be making regular shipments to the leaching plant at Anaconda by spring.

It is reported, although not officially confirmed, that two new orebodies have just been cut in the Colorado mine of the Davis-Daly Copper Co. On the 2100-ft. level a vein 6 ft. wide and said to assay 8% copper has been opened and another copper vein is being opened on the 2700-ft. level. This property is under the management of J. L. Bruce.

NEVADA

ARROWHEAD NOTES. —TONOPAH MINING CO. TO START MILLERS PLANT.

ARROWHEAD.—A raise from the east drift on the 175-ft. level of the Arrowhead is nearing the extension of the rich ore-shoot found on the 100-ft. level. The winze from the east drift on the 100-ft. level, now nearly 50 ft. deep, continues to expose exceedingly rich silver ore and Tonopah and Goldfield engineers who have visited the mine recently are highly pleased with general conditions. Ore in the bottom of the winze assays from \$400 to \$500, with numerous seams of pure ruby silver. The shaft of the Arrowhead Extension, adjoining the Arrowhead on the east, is 50 ft. deep and indications are that the sulphide zone will soon be reached. The Arrowhead Ex. is regarded as the most promising prospect in the district. It is reported that the Arrowhead will soon start sinking a new shaft near the Extension line. The latest company to erect a head-frame and hoisting machinery is the Consolidated, one mile south-west of the Arrowhead.

CACTUS.—Sol Camp, of Goldfield, superintendent of the January mine in the early days, who has been appointed superintendent for the Cactus Nevada Silver Mines Co., states that a contract soon will be let for sinking the main shaft of the company an additional 100 ft. to a total depth of 300 feet.

SILVER PEAK.—A cross-cut from the bottom of the 225-ft. shaft of the Allied Mining & Milling Co., operating 16 miles south of Silver Peak, has shown the vein to be 10 ft. wide, with samples containing 5 oz. silver per ton for this width. A drift has been started toward the extension of the ore-shoot developed on the upper levels.

EUREKA.—Sinking of the main winze from the 400-ft. level of the Eureka Croesus is to be discontinued at a depth of 300 ft. No further work will be done in the winze until the shaft has been sunk from 700 to 800 ft. and the workings drained to this depth, when the winze and the shaft will be connected. Work at other points in the mine is adding to the ore resources rapidly and shipments average from 750 to 1000 tons monthly. A vertical winze, in addition to one following the ore, is being sunk to the 'cave' orebody opened at a depth of 200 ft. in the California claim, at a point south-west of the Catlin, or main shaft. This orebody assays over \$150 per ton for a width of 8 ft. Ore averaging from \$50 to \$75 per ton is being broken from five faces on the 400-ft. level.

MONTEZUMA.—After having been idle for over two months, during which the owners considered the alternatives of selling or continuing development, work has been resumed on the Monitor group of claims. A cross-cut has been started from the bottom of the 100-ft. shaft to cut veins parallel to that in which the shaft is sunk. From 3 to 3½ ft. of silver-lead ore assaying from \$75 to \$150 per ton is exposed in drifts that have been driven short distances into the ore-shoot on the 50 and 100-ft. levels. Goldfield engineers say the Monitor is one of the best developed prospects in the southern part of the State. O. R. Whitaker has done practically all the work.

TULE CANYON.—Harry Stimler and a party of New York men recently visited Tule canyon. They are reported to have paid \$1000 for a fractional claim between the Ingalls mine and the White and Jaggers groups and it is said that a deal involving the sale of these two groups and possibly the Ingalls is under consideration. A 5-stamp concentrator is being built on the Benton lode claims, near the northern end of the canyon. The canyon remains dry and no placer mining is being done.

TONOPAH.—It is reported that the Millers plant of the Tonopah Mining Co. will re-open shortly after the first of the year. The plant, which has a capacity of 500 tons per day, has been idle for one year, during which time the company has shipped to the Belmont mill in Tonopah. The reason for the decision to re-open the plant is not known.

GOLDFIELD.—At a meeting of the stockholders of the Goldfield Development Co. the plans of the company for increasing the capitalization from 2,500,000 to 4,000,000 shares were approved. The 12 to 14-in. seam of ore assaying in places as high as \$11,000 per ton found on the 250-ft. level of the Combination has been cut 50 ft. south of where it was first opened, the width and value being practically the same. From November 1 to December 20 three Florence lessees shipped ore of an estimated value of over \$35,000, the Florence Divide, with over \$25,000, being the principal producer. The south-east cross-cut being driven by the company on the 358-ft. level is 361 ft. long and the west cross-cut on the same level is 526 ft. long. A promising body of quartz on which it is planned to drift has been opened in the south-east cross-cut.

UTAH

SAFETY FIRST CONFERENCE.—AGREEMENT REACHED BETWEEN PARK CITY COMPANIES.

SALT LAKE CITY.—A conference of safety engineers and other employees of local smelters and concentrating plants engaged in welfare work, was held recently in the office of the State Mine Inspector, Carl A. Allen, at the State Capitol. J. C. Welsh of the International Smelting Co. at Tooele, lead the discussion, at the opening session, on dangers from smelter fumes. B. O. Johnson of the Midvale plant of the United States Smelting & Refining Co., had charge of the topic of safeguarding belts and moving machines. C. Chamberlain of the Murray plant of the A. S. & R. Co. spoke of electrical safeguards. The best methods of securing the co-operation of employees in safety work was the topic of R. U. Wood of the Garfield smelter. C. H. Wilson, safety engineer of the Utah Copper Co., took up the subject of relations between the safety inspector and the plant foreman. Dr. T. B. Beatty, State Health Commissioner, and Dr. A. L. Murray, of the United States Bureau of Mines, were interested participants in the discussion on the effect of smelter fumes.

A course in practical prospecting is to be given during the month of January by the Utah School of Mines. No laboratory fees will be charged, the only fee being a nominal one of \$1 for registration, but it is expected that

those who enroll will be genuinely interested in the course, which will begin January 5 and end January 31. It will comprise 36 lectures of one hour each and about 20 laboratory periods, each 3 hours in length. The course will cover the fundamentals of geology, mineralogy, mining, and the metallurgical treatment of ores.

After six weeks of legal battle in the United States District Court, the attorneys in the case of the Utah Consolidated Mining Co. against the Utah Apex Mining Co., involving property rights in the West Mountain mining district worth approximately \$6,000,000, made final arrangements with the court concerning the arguments and shook hands. Three days, commencing Monday, January 26, have been set aside by the court for hearing the arguments, and many students of geology and mining lawyers will attend the court to listen to the ideas advanced. Both sides have had the services of the best mining and legal experts, and considerable interest is manifested in the final outcome of the case.

ALTA.—Development work carried on during the past three months at the South Hecla mine has been satisfactory, according to George H. Watson, the manager. Although shipments have been curtailed by lack of transportation facilities, the result of development work carried on in the interim has been satisfactory. Recent heavy storms have resulted in definitely suspending railroad operations for the winter, so that it will be necessary for local mines to send ore to the valley smelters by sleighs. This year, with an unusually heavy fall of snow, it may be possible to haul ore in this manner for three or four months.

Samples taken from the stope on the 200-ft. level of the Emma Silver mine show excellent ore, averaging from 36 to 107 oz. silver per ton. Arrangements have been made by George H. Dern, general manager, to begin hauling ore with sleighs as soon as the road can be opened up. When this is done, development work and the breaking of ore can be expedited. The present method of storing ore, while the bins are full, necessitates a second handling, but the management considers that as long as pumping operations must be maintained, some ore should be broken.

EUREKA.—Directors of the Tintic Standard Mining Co. met at Provo on December 12, and declared the regular quarterly dividend of 8c. per share, payable December 24. After the meeting it was announced that a special dividend will be decided upon December 22. The total dividends paid by this company to date amount to \$682,456.

Ore shipments from the district for the week ending December 13 show a decrease of 5 cars from the previous week. The Chief Consolidated shipped 41 cars; Tintic Standard, 28; Iron Blossom, 13; Dragon, 12; Eagle & Blue Bell, 12; Colorado, 7; Centennial-Eureka, 6; Mammoth, 5; Grand Central, 4; Gemini, 4; Ridge & Valley, 3; Victoria, 3; Empire Mines 2; Gold Chain, 1; Swansea, 1; Utah Con., 1; total, 143.

A terrific gale struck this camp on the night of December 12, doing considerable damage in the town and

surrounding country. At the Chief Consolidated's plant, two 50-ft. smoke stacks fell over, and a 75-ft. bridge at the Eagle & Blue Bell was blown from its foundations. Power and telephone lines also were put out of commission.

PARK CITY.—All litigation, present or threatened, between the Silver King Coalition Mines Co. and the Keystone Mining Co., two of the largest companies in the district, is eliminated as the result of an agreement recently entered into. The following announcement was made by officials of the Silver King company: "A settlement of pending and threatened litigation has just been consummated among several mining properties in this district,

which are, and may be, a matter of controversy." It is understood that in addition to the grants and releases, the Keystone company receives a substantial cash consideration, the amount of which is not disclosed.

The Daly Mining Co. has declared its 91st dividend, of 10c. per share, payable January 2. This will call for the payment of \$15,000, making a total of \$112,000 for the year and a grand total to date of \$3,142,000.

STOCKTON.—The work of repairing the shaft at the Stockton Standard mine is going forward rapidly. Recently, officials of the company decided that it would be advisable to replace the shaft timbering, which was settling and becoming weak. By the first of the year the

LEXINGTON MOUNTAIN, NORTH-WEST KOOTENAY, BRITISH COLUMBIA

which is of general interest to the public and of special interest to the stockholders of the Silver King Coalition Mines Co. and the Keystone Mining Co., and the estates of David Keith and Thomas Kearns. All litigation, actual and threatened, is eliminated, and certain rights and easements are mutually granted, which are of great present and future value in the development of the interests concerned. The Coalition company dismisses all actions against the Keystone company, involving apex rights and grants, and grants on a rental basis, easements through certain of its workings, through which the Keystone company can at once proceed to extract ore and develop its property. The Keystone Mining Co. dismisses its action involving the Crescent fissure and its proceedings for condemnation of right-of-way through Silver King Coalition ground, and releases certain additional extralateral rights to the Silver King Coalition

company expects to have this completed and a new gas-engine in place, according to J. C. Fleury, manager. As soon as the above improvements are completed, the management will speed the work of developing the orebody encountered this fall. This orebody, assaying high in silver and lead, has been drifted along for a distance of 55 ft. and found to be continuous. At the junction of an east-west break with a north-south fissure, a winze was sunk to a depth of 25 ft., all in ore.

BRITISH COLUMBIA

PREMIER PLANS TO SHIP.—NEW MILLS IN SANDON DISTRICT.

SLOCAN.—The Standard Silver Lead Mining Co. has developed a new ore-shoot between the fifth and seventh levels. The shoot is over 300 ft. long, 12 to 14 ft. wide, and assays 16% zinc and 5% lead, besides containing

varying quantities of silver. Already nearly 300 tons of concentrate has been shipped. During the strike at the Consolidated M. & S. Co., the Sullivan mine, at Kimberley, the mines of the Slocan district, were able to dispose of zinc concentrates, which had accumulated over a considerable period for want of a market. The strike is now ended, and the Sullivan, with the improvements that are being made, will turn out more zinc concentrate than ever before.

ALBERTA.—The extensive oil deposits believed to occur in the Great Slave Lake and Peace River districts of northern Alberta have attracted the attention of several large oil companies, including the Standard, the Shell, and the Anglo-Canadian, the last two controlled by British interests. These concerns, as well as a number of smaller companies, are preparing to send out prospectors and drilling outfits as soon as navigation opens.

SKEENA.—The Belmont-Surf Inlet Mining Co. is emulating the Granby Consolidated M. S. & P. Co. in improving the living conditions of its men. A model town is being built at the mines, comprising homes and public buildings that are lighted by electricity and heated by steam. There is little doubt that the excellent feeling that exists between the Granby company and its employees is due to the considerate and fair way in which the men are treated.

TRAIL.—The Consolidated company has declared the usual quarterly dividend of $2\frac{1}{2}\%$, payable January 2 to stockholders on record December 10. The disbursement amounts to \$261,963, bringing the total up to \$6,305,275. C. A. Seaton, of the Sullivan mine staff, has been appointed manager of the Molly Gibson mine.

YALE.—A new compressor has been installed at the Donohoe mine, Stump lake. Diamond-drilling operations have been started at the Aspen Grove mines, Stump lake, under the supervision of M. H. McLeas, of Santa Barbara. A discovery of vanadium ore is reported from the Aspen Grove district.

PRINCETON.—Work at both the mine and mill of the Canada Copper Corporation's plant, practically has been suspended until the completion of the railway. But for the strike during four months of the past summer, the railway would have been completed, and the company would have been giving employment to 700 men this winter.

STEWART.—With a large tractor, in conjunction with its own teams as well as those of the Bush Ltd., Forty Nine, and other companies, it is expected that some 3000 tons of ore will be shipped by the Premier Mining Co. this winter. The road is in excellent condition, the ground having been frozen before the first snowfall. W. A. Melloche, of New York, is said to have secured an option on the George copper group, owned by W. B. George of Stewart and R. George of Vancouver. It is understood that a diamond-drill will be put on development work in the spring.

QUESNEL.—Construction plans in connection with the extension by the British Columbia government of the Pacific Great Eastern Railway into the northern section

of the Province, with the object ultimately of tapping the Peace River region, are being watched by those interested in the opening of the vast mining area lying some 60 miles east of the line as now located. At Boulderville, Hydraulic, Quesnel Forks, Keithley Creek, Barker-ville, Stanley, and Wyngdam many properties are in need of transportation facilities. New York operators at Wyngdam were compelled to haul machinery, including a large boiler, from Ashcroft up the Cariboo road for a distance of 260 miles, 14 teams being employed in the work.

HAZELTON.—The Delta property, situated on Rocher de Boule mountain, is to be re-opened and developed, the initial operations being carried on under W. G. Norrie-Loewenthal, superintendent of the Silver Standard at Glen Mountain. Mr. Norrie-Loewenthal will lay out the plan of development and give as much of his time as is necessary to its direction. Work already has been done on the Highland Boy property, which adjoins the Delta, some high-grade ore being exposed.

SANDON.—On the Noble Five and the Reno properties, acquired and consolidated by James Dunsmuir, of Victoria, the newly constructed 100-ton concentrator, which started early in July, is handling the mine output satisfactorily. This mill provides for concentration by flotation, jigs being used in the first stages of the process. There is also a new 150-ton concentrator, built by Clarence Cunningham at Alamo. Among the properties operated by Cunningham, which probably will contribute ore to this mill, are: the Queen Bess, Idaho-Alamo, Wonderful, and Sovereign. At the last two, tramways have been built connecting them with the railway. The Roseberry-Surprise Mining Co. has been the district's banner producer, at the same time having been actively engaged in development work at the Surprise, Bosun, and Ivanhoe properties.

WINDERMERE DIVISION.—The Paradise mine has been operating steadily during the year and has maintained its average production, although somewhat handicapped by labor conditions. New development work is being done on the lower workings which promises well. The Trojan Mining Co. is developing its properties on Boulder creek and small shipments have been made from the Trojan and Sitting Bull properties. The Lead Queen, on 'Number 3' creek, has been purchased by Paul Dernhart, of Seattle, and 40 tons of high-grade silver-lead ore has been shipped. Present work consists of driving a cross-cut to develop the vein at a greater depth. Mr. Dernhart also recently acquired the Isaac property on the same creek.

GOLDEN.—The Couverapee mine has been temporarily idle because of a dispute as to the boundary lines between that property and the Monarch mine. Recently it has been reported that the two have amalgamated and that shipments to Trail have been resumed. C. J. Lincke, who is operating some claims on the Middle Fork of the Spillimacheen river, is understood to be making arrangement to pack out copper ore. The Rose and Daisy claims, formerly known as the I. X. L. and Condor, have been bonded to a company which is reported to have put a small crew of men to work.

ONTARIO

COBALT NOTES. -HOLLINGER DIVIDEND.

COBALT.—A number of silver producers are withholding shipments of bullion on the strength of the belief that quotations will record another increase. The Canadian government has taken up the question of reducing the proportion of silver in Canadian coinage as a means of lessening the possibility of melting of coins.

The Beaver mine is reported to be earning from \$2000 to \$3000 per day. F. L. Culver, the president of the company, states that it is his intention to begin at the surface

Castle property in Gowganda. The consolidation of the Hargraves and the Reliance properties has been completed and arrangements are now being made to commence work.

A material increase in current ore shipments was recorded last week, the consignments amounting to 243½ tons. The Mining Corporation of Canada shipped 113,737 oz. of bullion. The Nipissing during November mined ore of an estimated value of \$350,209 and shipped bullion from Nipissing and custom ore with an estimated net value of \$593,533. The Crown Reserve has encountered some of the richest ore yet found in the mine at a

STATION AT THE NORTH SHAFT, SAN JUAN LEVEL, EL ORO, MEXICO

and mine the property all over again. This decision has been reached owing to recent exploration work, which revealed a large tonnage of medium-grade ore which was missed in the early stages of development when attention was concentrated chiefly on high-grade ore. The Temiskaming Mining Co. has declared a dividend of 4%. The company, after a successful year, has a surplus approximating \$1,000,000. The Coniagas company will hold its annual meeting December 22. The output for the fiscal year ending October 31 amounts to 900,000 oz. with a value about equal to that of the preceding year. A decision has been handed down in connection with the boundary dispute between the O'Brien and the La Rose Consolidated companies. The action was dismissed and the costs assessed to the O'Brien company. A number of deals for property in the Gowganda silver district are being closed. The Trethewey company is preparing to send out a shipment of 20 tons of high-grade ore from its

depth of 150 ft. The vein is four inches wide. The Kerr Lake company during November produced approximately 115,000 oz. of silver, this being the record output for some months. Diamond-drilling operations are under way at the Advance from the 310-ft. level. The Northern Customs concentrator is repairing the equipment on the property recently purchased from the Chambers-Ferland company preparatory to starting operations.

PORCUPINE.—The output of the Hollinger Consolidated is the largest in its history. The dividend recently declared, which is the seventh during 1919, calls for the disbursement of \$246,000, bringing the total payments for the year up to \$1,722,000. Since the first operation of the mine in 1911 the total production has amounted approximately to \$43,000,000. The Porcupine Crown is negotiating for the purchase of the Moneta property adjoining the Hollinger on the West. The Dome Lake mill is nearly completed and is expected to be in operation

before the end of the year. Carl Frank, formerly on the staff of the Dome Mines, is in charge of operations.

The Dome Mines continues to treat about 1000 tons of ore daily. The financial position of the company is being gradually strengthened and a dividend of 25c. per share will be disbursed on January 15.

TORONTO.—All indications point to a great expansion in the gold and silver mining industries of Northern Ontario. The improvement in labor conditions, the importance of recent discoveries showing the feasibility of deep mining, and the fact that American money is at a premium in Canada, have drawn the attention of American investors to the opportunities offered by the gold and silver camps to an unprecedented extent. Large amounts of capital are being invested in mining properties and production is showing a steady increase. Next year will witness a remarkable advance in the development of many new prospects, more especially in the newer fields.

KIRKLAND LAKE.—The Lake Shore mine has been de-watered to the 300-ft. level. During November 570 tons of ore was milled with a production of bullion worth \$10,246. Some high-grade ore has been encountered on the 700-ft. level of the Kirkland Lake, the deepest point of operation in the camp. The mill is treating an average of 150 tons per day. On the Canadian-Kirkland property, controlled by the Crown Reserve company of Cobalt, underground work has been started. Surface work indicates wide veins of ore of medium grade. The Ontario-Kirkland has obtained funds for development by the sale of 400,000 shares of treasury stock and underground work is being pushed.

GOWGANDA.—A number of properties in this district have changed hands and other deals are being negotiated. The Cartwright property at Bloom Lake has been optioned to Toronto interests at a high figure. The Mc-Alpine claim has been purchased by John Oliver of Toronto. Ownership of the Everett claim adjacent to the Castle and probably containing a continuation of the vein system of the latter, is being negotiated for by a syndicate of which Sir Henry Pellatt, a prominent Toronto financier, is a leading member.

SONORA

NOTES OF SONORA ACTIVITY.

ALAMOS.—The La Prieta gold property in this district will be re-opened soon by Joseph L. Obermuller and L. H. Wilson and will operate on a larger scale than before. The 12-ton mill will be enlarged as soon as the necessary machinery and supplies are received. Navajoa is the nearest rail point. The people of this district are friendly to the mining industry and there is plenty of labor to be had at reasonable rates. The Promontorio Mines Co. and several smaller organizations are operating. Work hitherto interfered with by the Yaqui Indians is expected to be resumed as the Indians are believed to have been crushed effectually by the campaign of the Government and State troops. The recent storming and capture of the strongholds at Bacatete and Bacatetito, with the result that 52 Indians were killed and more than 200

women and children taken prisoners, was the final stroke.

CANANEA.—The Cananea Consolidated Copper Co. has cut its production to three and a quarter million pounds, which will be maintained indefinitely.

NACAZARI.—R. C. Williams, of Baltimore, Maryland, has taken a bond on the Virgin de Plata group of claims, a promising silver prospect 17 miles south-east of here, from J. H. Canon of El Paso, S. W. White of Douglas, and C. H. Cartee of Baltimore, Maryland. Mining and development work will be started with Joe Adair in charge. The main vein has been developed from a few inches wide at the surface to more than four feet at the 110-ft. level. A shipment of ore will be sent to the smelter at El Paso. Mr. Williams, who has been examining other properties in this district and southern Arizona, in behalf of wealthy Eastern clients, will return to this district shortly after the New Year.

PROGRESSO.—The Progreso Silver Mines Co., operating near Batuc, is shipping two Pachuca and one Dorr cyanide tanks from the border to its property. The scope of its mill operations will be enlarged now that water concentration and cyaniding have proved entirely successful. The property is shipping bullion weekly to the Selby refinery in San Francisco.

MOCTEZUMA.—R. R. Belknap, formerly engineer for the Shattuck Arizona mine at Bisbee, will arrive at the Con. Virginia mine situated in the south-eastern part of the Moctezuma district soon after January 1, intending to put to work a force of 20 men on development. The Con. Virginia was bonded recently by Ygnacio Soto to L. C. Shattuck of Bisbee. Several hundred feet of work was done on the ground by the late Carlos C. Soto before war conditions forced him to abandon it temporarily. Con. Virginia is a silver-gold property and has surface indications which promise permanency in the deposit. It is probable that the Con. Virginia will ship and receive supplies by way of Pearson, Chihuahua, 60 miles north-east.

An important decision has been rendered by the State Legislature in the county-seat fight between Moctezuma and Cuppas, when the members of the Congress decided that the former was entitled to be the capital of the Ninth District of Sonora. The mineral agency, stamp offices, court of the first instance and county officers soon will move back here. The county seat formerly was situated in Moctezuma, but was removed by the Constitutionalists several years ago.

CUMPAS.—High-graders attracted by the high price of silver are said to be working a number of properties in this vicinity, extracting high-grade ore and selling it to ore buyers at the border. There have been a number of thefts of ore and concentrate in transit reported to the county officials here.

MINA MEXICO.—A force of miners has been put to work preparing for the re-opening of this property after its long close-down. Machinery for the 50-ton flotation plant has been shipped from El Paso and is on the way to the mine. Most of it will have to be freighted by pack train from Moctezuma to this point.

ARIZONA

Globe.—The first annual convention of the Southwestern District of the American Association of Engineers will be held here on January 9, 10, and 11, with members of the Globe-Miami chapter acting as hosts.

Business meetings and inspection trips to the various mines and mills in the vicinity will occupy the first two days and a trip to the Roosevelt dam will be a feature of the third day. A smoker will be given at the Old Dominion library the first evening and the delegates will banquet at the Miami Y. M. C. A. on the evening of January 10.

The Southwestern Society of Engineers with a membership of over 400 engineers from Arizona, New Mexico, and Texas recently affiliated with the American Association of Engineers. G. Montague Butler, Director of the Arizona Bureau of Mines and Dean of the Engineering College of the University of Arizona, was president of the former organization and now holds the same office in the Southwestern District of the American Association of Engineers.

Kingman.—Hill and Mattson, who are leasing the Antler and Copper World mines situated in the Yucca district, are shipping ore that assays 14% copper and 2½ oz. silver. Recent development has opened a rich streak of copper-silver ore.

The 'apex' cases of the United Eastern Mining Co. against the Tom Reed company, involving the orebodies on the Big Jim claim, which were to come up for trial in the Superior Court in the September session, are now to be tried in January by consent of parties. Extensive work by both companies has been done to prove their cases.

Mayer.—It is announced by W. H. Skinner, president of the Pocahtontas Mining Co., that the new 50-ton mill has been completed and is ready for operation. This gold-silver-lead property has been under development at intervals during the past ten years.

Prescott.—The plans of the directors of the Grand Island Mining Co. are to sink a winze on the third tunnel level of the Mark Twain mine upon which the Grand Island has a bond and lease. Development to date has been favorable.

CALIFORNIA

Auburn.—Erection of a gasoline hoist and 10-stamp mill is proceeding at the Nevada Hill-Two Orphans property, recently acquired by E. F. Stephenson, of Auburn, and San Francisco associates. Both mines produced rich ore in pioneer times but have attracted little attention for 40 years.

—Prospecting of the Dan Kirby property, in the heart of Auburn, has been started by H. M. Chambers and William Kingsley. Indications are declared favorable for development of gold ore.

Brownsville.—Driving of the drainage tunnel is advancing steadily at the B. A. C. property, often known as the Solano Wonder. The operators were forced to cease work in the shaft two years ago because of water. Rich ore was produced from the surface workings. Major E. A. Hoeppner is manager.

Mariposa County.—R. O'Donald and Marcus Shinski have reported the discovery of platinum ore at their mine, located

in Devil's gulch, about five miles from Jerseydale. Samples from a 4-ft. vein have assayed \$90 per ton in platinum and \$44 in gold. The vein material contains tin, cobalt, nickel, and other metals. The Government experts report this ore as very much like the ore from the Ural mountains, the main source of our platinum supply. Should the discovery prove as valuable as is at present indicated, there is no doubt about the value of the property, as platinum is needed badly in the United States owing to the supply from Russia being cut off by the uncertain traffic conditions.

Nelson Point.—The Gold Drift M. & M. Co. is contemplating erection of a 100-ton mill in the spring. A wagon road will be first built to the property from Nelson Point. A. E. Hildreth of Oakland is heavily interested.

IDAHO

Coeur d'Alene.—The Hecla Mining Co., operating at Burke, has opened an orebody on the 2000-ft. level which is expected to add material to the ore reserves. The disclosure is reported to have been made on the No. 1 vein which is not to be confused with the 'east orebody', over the possession of which litigation has been started. Ground has been cleared and excavation has been completed for the new tunnel projected on the property of the Hypotheek Mining & Milling Co. and the work of driving the bore will be started at once, according to Otto A. Olson, manager. A blacksmith shop and other equipment has been installed. The report of the Alhambra Mining Co. owning property near Wardner shows: Total expenditures \$168,326, of which \$146,096 was on development account, \$16,055 for general expenses, \$1293 for surveying, and \$2859 on patent account; receipts \$168,326, of which \$2501 was derived from the sale of ore and \$165,000 from assessments. At a meeting of the directors of the Tamarack & Custer Consolidated Mining Co. a dividend of 3c. per share was declared, payable on December 24 to stockholders of record on December 13. The disbursement will amount to \$53,250 and is the first dividend declared by the company this year.

MONTANA

Butte.—The Butte & Superior Mining Co. has filed its accounting setting forth the profits accruing through the infringement of the Minerals Separation North American Corporation flotation patents as being \$451,000. The company states that the accounting was filed as an aid in determining, and not an admission of, the amount of recovery, if any, to which Minerals Separation may be entitled. Furthermore, the company does not admit that all gain and profit are legally attributable to invention of patent in the suit. It does claim and will try to prove that a large share of the profits was due to the company's own efforts.

NEVADA

Goodsprings.—A 5-ft. vein of copper ore has been found in the Azurite mine, 30 ft. below the stope which produced high-grade ore when worked under lease by Egger and Fredrickson. The discovery was made by W. E. Allen and W. Cooper, lessees. The ore is said to average above 10% copper. The Singer property has been leased by J. A. Fredrickson and P. H. Springer, Jr.

Mina.—Our attention has been called to an error in the news from this district in the issue of December 13. It was stated that "a number of companies that started work at the height of activity in the district have suspended operations. This includes the West Extension." We have received a letter from the Mina Bureau of Mines, which states that there is no justification for this statement, and that "all the companies that were operating at the height of activities are still operating, notably the West Extension, which has been and is continuing its work with the usual force of men". We regret this error.

Pioche.—The Black Metals Mining Co. reports the discovery of rich silver-lead ore in its Day mine, at Jackrabbit. The ore was found north-west of the May Day vein on the 325-ft. level. Assays are said to range from 100 to 2000 oz. silver. Drifting has started to determine the extent of the orebody. George Snyder is general manager.—The lease operated on the Yuba mine, by Alexander Lloyd and W. D. Price, has exposed high-grade silver-lead ore. The discovery was made in the winze from the Pacific tunnel.—Shipments of the Prince Consolidated company are averaging 1450 tons per week. Development work in virgin ground continues satisfactory.

Reservation.—The Review Mining Co. has started driving a long tunnel to open veins at a depth of 500 ft. The property is traversed by a large silver-lead vein, striking north and south, and several cross-veins. Orders are to be placed for compressor, drills, and other machinery. George W. Howell, of Howell-Dormann Co., Oakland, California, is general manager.—The Elkton Divide Mining Co. has begun work on the Pinto claim leased from Reservation Hill company.

SOUTH DAKOTA

Lead.—The fire which has been burning in the Homestake mine since September 25 has been extinguished by flooding. It was necessary to flood the mine only to the 600-ft. level. The mine is now being rapidly unwatered and milling operations have already been resumed on ore being mined from the upper levels. Work on the flooded levels will be resumed as rapidly as the levels are unwatered, as the only effect of the flooding has been to cleanse the mine. The unwatering will require only a short time.

WASHINGTON

Spokane.—An offer of \$100,000 for the Silver Queen and Snowstorm mining properties at Deer Trail in Stevens county, made by C. S. Turner, of Davenport, has been received by M. E. Jesseph, receiver. Until recent years operations on the property have been conducted by the Silver Basin Mining Co., of which Mr. Turner was president. The mine is familiarly known as the Silver Basin. It has produced \$200,000 worth of ore.

The Electric Point Mining Co. is preparing for a steady production of ore in 1920, according to Roy A. Young, president. He expects to have the preparations completed by the holidays. The orebody opened recently at the surface has been tapped at the 50-ft. depth and a cross-cut on the 100-ft. level is approaching the ore.

BRITISH COLUMBIA

Trail.—Ore receipts at the Trail smelter of the Consolidated Mining & Smelting Co. for the week ending December 7 totalled 6229 tons. The chief independent shippers were as follows: Highland, Cedar Creek, 156 tons; Mountain Chief, Renata, 100 tons; North Star, Kimberley, 206 tons; Silversmith, Sandon, 144 tons; Standard, Silvertown, 388 tons; Surprise, Roseberry, 246 tons; and Van Roi, Silvertown, 46 tons. Of the company's mines the principal shippers were: Centre Star, Rossland, 2775 tons; Emma, Eholt, 553 tons; St. Eugene, Moyie, 250 tons; Sullivan, Kimberley, 1218 tons of zine ore.

Personal

The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

H. C. Hoover is spending the Christmas holiday at Palo Alto.

A. T. Watson has returned from New Zealand to San Francisco.

K. P. Swensen, representing the Horne Co., Ltd., is here from Tokyo, Japan.

Cecil A. Gorelangton has returned from China, and is now at Honolulu, in Hawaii.

H. D. Pallister is superintendent for the McKinney Steel Co., at Wolfpit, Kentucky.

P. R. Bradley, manager of the Alaska Treadwell and Alaska Juneau mines, spent the holidays in San Francisco.

E. A. Loring, of Bewick, Moreing & Co., London, is here on a visit to his father, W. J. Loring, who has returned from Boston.

R. H. Haffenreffer, Jr., president of the Utah-Apex Mining Co., left Salt Lake City on December 14 for his headquarters at Boston.

O. B. Perry is on his way to the Federated Malay States, in connection with the Guggenheim tin-dredging operations near Ipoh.

John T. Reid is visiting eastern Nevada, Utah, Montana, and Washington, and later New York. He will be away until next spring.

Carl B. Anderson, formerly with the Illinois Geological Survey and the Gulf Oil Corporation, has joined the staff of Rogers, Mayer & Ball.

Marion H. Foss, mining engineer of Salt Lake City, has accepted the position of manager for the New Life M. & M. Co., at Idaho Springs, Colorado.

H. Benton Leggat, consulting mining engineer for the Argyle Silver Mining Co., has returned to Salt Lake City after a trip to the company's property at Butte.

J. R. Harbottle, general manager for the Batopilas Mining Co., has gone from Silver City, New Mexico, to Batopilas, Chihuahua, Mexico, to resume operation of the mines.

H. V. Winchell, president, and **Bradley Stoughton**, secretary, of the Institute, addressed the San Francisco section in the evening of December 22, after a dinner at the Engineers Club. The occasion proved unusually interesting.

R. C. Gemmell, **D. D. Moffatt**, and **E. W. Engelmann**, of the Jackling porphyry properties, were in Nevada recently, inspecting the operations of the Nevada Con. Copper Co. **C. B. Lakenan**, general manager of the property, accompanied them from Salt Lake City.

J. L. Bruce has resigned as general manager for the Butte & Superior Mining Co. at Butte to accept a similar position with the Davis-Daly Mining Co. **Charles Bocking**, assistant manager, has been promoted to the position of manager for the Butte & Superior Co., effective January 1.

H. B. Tooker, for several years secretary to **D. C. Jackling**, has been appointed traffic manager of the Bingham & Garfield, Nevada Northern, and Ray & Gila Valley railways, effective on December 1. On January 1, Mr. Tooker will assume the same title with the Utah Copper, Chino Copper, Nevada Consolidated Copper, Ray Consolidated Copper, and Butte & Superior mining companies.

C. F. Jennings, of Salt Lake City, for some years assistant purchasing agent of the Jackling porphyry properties, as well as for the Butte & Superior Mining Co., the Alaska Gold Mines Co., the Bingham & Garfield Railway, the Nevada Northern Railroad, and the Ray & Gila Railroad, has been appointed general purchasing agent for all the above-named companies.

THE METAL MARKET

| Spelter, cents per pound..... | 10 00 |
| Zinc-dust, cents per pound..... | 12.50-15.00 |

EASTERN METAL MARKET

(By wire from New York)

December 23.—Copper is quiet and steady. Lead is active and higher. Zinc is dull but firm.

SILVER

Below are given official or ticker quotations, in cents per ounce of silver 999 fine. From April 23, 1918, the United States government paid \$1 per ounce for all silver purchased by it, fixing a maximum of \$1.01½ on August 15, 1918, and will continue to pay \$1 until the quantity specified under the Act is purchased, probably extending over several years. On May 5, 1919, all restrictions on the metal were removed, resulting in fluctuations. During the restricted period, the British government fixed the maximum price five times the last being on March 25, 1919, on account of the low rate of sterling exchange, but removed all restrictions on May 10. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the normal rate of exchange.

MONEY AND EXCHANGE

The money market remains fundamentally very firm, with no suggestion of any material easing in tone or expansion of credit supply for some time to come. The policy of banking pressure to curb expansion throughout the land, and in other things besides securities, is not an affair of a day. The general idea among bankers is that the combination of the existing situation and of this banking program will keep rates relatively high for some time to come. As a matter of fact, such credit-absorbing items as farm lands and oil-fields present a much more stubborn problem than do the security markets. The former may eventually prove to have included in much more 'speculation' than the latter, while the process of liquidation is relatively much less easy. There is some sentiment being expressed for revision of reserve requirements in the reserve system, not as regards the general ratio, but rather as to the classification of certain districts. Some reserve cities would like to become 'country' places, while St. Louis, for example, would prefer to be a reserve instead of a central reserve city, thereby reducing deposit reserve from 13% to 10%.

In a fresh decline in the foreign exchanges, sterling recently plunged through the \$4 level. Defeat of the treaty and the steady pressure of commercial bills are assigned as the motives. Speculation on the short side may also be a contributing factor. France also recorded a new low at 9.80 to the dollar. Some improvement may be hoped for as a result of a rumored British loan to France, and another \$200,000,000 American loan to Great Britain. Some tangible evidence for belief in a compromise on the ratification of the peace treaty, would doubtless have a favorable influence.

Commenting on the exchange situation, one banker who has been in close touch with foreign markets for 40 years recently advanced the following line of argument:

"There is a much more deep-seated reason for the decline in the British exchange in New York than the recent heavy offerings of merchandise bills. This decline by checking exports from America and encouraging imports will rapidly correct the enormous trade balance against England. Exchange at \$3.70 amounts to a tariff on American shipments into England of 23%, and an export bounty of 23% on shipments from England here.

"If the readjustment of the merchandise movement were already completed, sterling exchange would still rule at a heavy discount. England is not on a gold basis. New gold as it arrives from the mines is dealt in freely in London at a large premium and can be shipped abroad, but the export of gold coin is prohibited.

"England is so deeply in debt as to create apprehension, unnecessary I believe, but widely prevalent, as to her ultimate ability to discharge all her obligations in gold, and this apprehension is increased by the continued extravagance of the present British government. Current estimates are that excess of running expenses from revenue for the fiscal year 1919-1920 will add a further \$475,000,000 to the British debt and the end is not yet in sight.

"The British government will have to live within its income before there can be any permanent substantial improvement in exchange from its present level."

Quotations on December 23 are as follows:

| | | |
|-----------|--------------|----------|
| Sterling: | Demand | 3.84 1/4 |
| Francs: | Cable | 10.35 |
| | Demand | 10.40 |
| Lire: | Demand | 12.90 |
| Marks | | 2.24 |

Eastern Metal Market

New York, December 16.

The markets are all strong but only moderately active in most cases.

Better buying demand has caused copper to advance moderately. The low point is believed to have been reached a week ago at 15 cents.

The tin market has been quiet with sterling exchange values the ruling factor in price changes and in buying momentum.

The strength of the lead market is pronounced, outside selling prices making the market.

Prices for zinc are largely influenced by foreign demand which is subject to fluctuations in the pound sterling, England being the best buyer.

Antimony is quiet and firm.

IRON AND STEEL

The week has witnessed little change in the rate of steel-works operation, but pressure from consumers has grown decidedly. The latter, particularly the more important ones, realizing that the supply in the first half of 1920 will not be enough to go around, are redoubling their efforts to cover. Makers on the other hand are oversold for first quarter, and some for first half, and the fact that fuel costs have risen and may rise further is not a cheering factor.

The Government's 50% restriction in coking coal came off soon after the miners decision, on December 16, to return to work, and other limitations have also been removed. The distribution of coal, however, is still subject to regulation by the Railroad Administration and many iron and steel plants are still hampered and will be for some time.

The Steel Corporation and a few other producers are sticking to the prices of March 21, but, in spite of this, finished material tends to follow the advance in pig-iron. Yet the amount of unsold steel which the leading sellers can offer for the first half is relatively small.

Belgium has placed orders for 150 locomotives with the American builders and may buy 50 more. Germany will probably supply 200 to Belgium.

COPPER

After holding steady for most of last week at 18.56c., New York, electrolytic copper is again stronger on more active demand and is quoted today at 18.75 to 19c., New York, for December-January delivery. Sales of good proportions are reported at these prices to domestic consumers as well as to Japan and England. The former is again particularly active. Lake copper is more or less nominal at 19 to 19.25c., New York, for early delivery with some sellers reported out of the market. The settlement of the coal strike and the generally better labor outlook are favorable factors, but as yet buyers are not hurrying to cover until conditions are more settled. The general trend is much better and it is believed that the recent level of 18c., New York, has marked the low price for some time to come. As to Japanese buying, it is stated that for the five months ending with September, that country's importations of copper amounted to \$10,826,000, as against only \$250,000 in the 10 years ending with 1915. Japan's production of copper is said to have decreased while her consumption has increased.

TIN

The market has been quiet but it has been, and is daily, influenced and practically controlled by the value of sterling exchange. Business has been done each day, but because exchange values have fallen tin prices have also declined. Spot Straits last week went as low as 52.87½c., New York, from 54c. earlier in the week, but it has again become firm

on better exchange values until yesterday it sold at 53.50 to 53.62½c., New York. For future shipment as high as 54.50 to 54.75c. is asked because of the stronger London market. All last week there was a mixed situation, due to the varied attitude of sellers. While the disposition to sell was general, some were willing to sell at current conditions and rates of exchange, while others were less inclined and held back. The higher London prices this week and the betterment in exchange values have caused the advance in New York, but buyers are more or less frightened and uncertain. The end of the coal strike is regarded as a bullish factor. Monday, December 15, the London market was £315 10s. per ton for spot Straits, equivalent to about 52.50c. per pound, with exchange at \$3.74 per £1. Yesterday it had receded to £314 per ton. Arrivals thus far this month have been 3883 tons, of which 1090 tons came in at Pacific ports. Tin afloat is estimated at 4000 tons.

LEAD

The market is very strong, the controlling factor being a scarcity of supplies. On December 12 the American Smelting & Refining Co. again advanced its price from 6.90 to 7c., New York, but the outside market had already reached this level. It has in fact again gone higher than the official price and today is up to 7.15c., New York, or 6.90c., St. Louis, which we quote as the market, it being understood that the leading interest is virtually out of the market. One seller states that sales have been made as high as 7.25c., New York, and that it is not at all improbable that the leading interest will again advance its price shortly. Stocks of virgin lead held by the British government on December 1 were 59,912 gross tons, a reduction of 4920 tons during November.

ZINC

With the easing in the value of sterling exchange the past week there has been a corresponding decline in the quotations for zinc, this market, like the tin market, being largely controlled by the factor of exchange. It happens that in the case of zinc, foreign demand, particularly from British sources, is heavier than domestic demand. In the last few months it is stated that from 10,000 to 12,000 tons of zinc has been exported each month to England. Japan has also been an important buyer. Producers are comfortably sold up well into the first quarter and are not eager to book heavily, for they regard the future as holding out bullish inducements. A week ago prime Western for December and first quarter delivery was selling at 8.35 to 8.40c., St. Louis, or 8.70 to 8.75c., New York, but with the fall in the pound sterling and the consequent slackening in foreign demand, prices have nominally declined until today the quotation is about 8.25c., St. Louis, or 8.60c., New York, for the same delivery.

ANTIMONY

The market is quiet and fairly strong at 9.62½c., New York, duty paid, for wholesale lots for early delivery.

ALUMINUM

No change has been recorded. Virgin metal is quoted nominally at 32 to 33c., New York, for wholesale lots for early delivery.

ORES

Molybdenum: The market is inactive and quotations are nominal at 75c. per pound of MoS₂ in 90% concentrates.

Manganese: Indian manganese ore is offered at a minimum of 72c. per unit, c.i.f., but buyers are not willing to meet this price. It is believed that consumers would pay as high as 60c. per unit.

Company Reports

EL TIRO LEASING COMPANY

Report for quarter ending September 30, 1919.

Property: leases on various properties at Silver Bell, Pima county, Arizona.

Operating Official: Percy Williams, manager.

Financial Statement: operating profit \$24,826; rehabilitation expense \$8744; net profit \$16,081.

Dividends: \$3000 to date.

Production: 31 cars or 1532 tons. Copper content 249,-237 pounds.

SHATTUCK ARIZONA COPPER COMPANY

Report for quarter ending September 30, 1919.

Property: mine and mill at Bisbee, Arizona.

Operating Official: Arthur Houle, superintendent.

Financial Statement: gross income, \$310,626; expense, \$237,993; depreciation charged off, \$18,329; net income, \$54,303.

Dividends: in 1919, \$437,500; total to date, \$7,525,000.

Development: 716 ft. of development driving on the 100, 300, and 500-ft. levels disclosed no new copper ore.

Production: dry tons copper ore smelted, 2498; dry tons lead concentrates smelted, 2783. Metals recovered: copper, 456,439 lb.; lead, 1,479,828 lb.; silver, 100,408 oz.; gold, 695 ounces.

ALASKA GOLD MINES COMPANY

Report for quarter ending September 30, 1919.

Property: The Alaska Gastineau Mining Co., which owns mines and mill near Juneau, Alaska.

Operating Officials: B. L. Thane, manager; G. T. Jackson, assistant manager.

Financial Statement: operating loss for third quarter \$27,289, as compared with \$56,483 for second and \$106,784 for first quarter.

Dividends: None.

Development: large orebodies both east and west of main cross-cut on No. 13 level have been proved.

Production: 532,142 tons of ore milled, of a gross value of \$0.90. Recovery was \$0.73 per ton; extraction, 81.34%; value of bullion produced, \$393,318.

DAVIS-DALY COPPER COMPANY

Report for quarter ending September 30, 1919.

Property: mine at Butte, Montana.

Operating Officials: James L. Bruce, general manager; William L. Creden, consulting engineer; William Frazier, mine superintendent.

Financial Statement: total receipts for the quarter amounted to \$669,478; disbursements, \$304,946; net profit, \$364,532; cash and quick assets on September 30, \$736,854.

Dividends: none in 1919. Total to date, \$450,000.

Development: shaft-sinking has been completed to a depth of 2700 ft. Total development footage for the quarter, 2257 ft. New ore-bins and hoisting-equipment have been erected.

Production: shipments for the quarter amounted to 21,850 tons, producing 3,230,000 lb. of copper and 126,000 oz. of silver. The average tenor of ore shipped was 7.46% copper.

CHIEF CONSOLIDATED MINING COMPANY

Report for the quarter ending September 30, 1919.

Property: mine in the Tintic district, Utah.

Operating Officials: Walter Fitch, president and general manager. Cecil Fitch, assistant manager and superintendent.

Financial Statement: during the quarter 16,179 tons of

ore yielded \$767,971, after deduction of smelting, transportation, and sampling charges. Balance sheet shows current assets, \$269,961; cash on deposit, \$339,716; Liberty Bonds, \$505,500; current liabilities, \$109,865.

Dividends: during 1919, \$282,954 was disbursed, making the total to date \$1,517,825.

Development: development footage amounted to 6787 ft. of drifts, raises, and winzes, and 137 ft. of shaft-sinking. No. 2 shaft is down 800 ft., being completely concreted for 775 ft. Diamond and churn-drill operations are being continued.

Production: metal contents of ore were: gold, 1168 oz.; silver, 873,417 oz.; lead, 1,944,307 lb.; and copper, 3288 lb.; gross value per ton, \$69.22; smelting, freight, and sampling, \$21.75 per ton; average net value, \$47.47. Total tonnage, 16,179.

BUTTE & SUPERIOR MINING COMPANY

Report for quarter ending September 30, 1919.

Property: mine and mill at Butte, Montana.

Operating Officials: J. L. Bruce, general manager; Charles Bocking, assistant manager; A. B. McLeod, mine superintendent; E. V. Daveler, mill superintendent.

Financial Statement: gross income, \$1,376,673; operating costs, taxes, etc., \$1,076,390; profit, \$300,283, as against \$210,226 for preceding quarter. Butte & Superior paid \$2,500,000 to Clark-Montana Realty Co. in settlement of apex litigation.

Dividends: no dividends in 1919. Total to date, \$16,940,-258. Dividends cannot be paid till after conclusion of Minerals Separation litigation.

Development: 5566 ft. of drifts, cross-cuts, and raises were driven on levels from 800 ft. to 2050 ft. Ore-reserves depleted by loss of certain portions of the ore deposits to the Clark interests.

Production: dry tons milled, 106,645; average zinc content, 14.168%; average silver content, 6.128 oz per ton; total zinc in concentrates, 28,978,051 lb. Wages were raised \$1 per day July 1. Mining cost \$6.68; milling cost \$2.68.

CONSOLIDATED COPPERMINES COMPANY

Report for fiscal year ending April 30, 1919.

Property: mines and concentrator at Kimberly, Nevada. Control of Giroux Consolidated Mines Co. and the Butte & Ely Co. Also properties in Mexico.

Operating Official: H. S. Munroe, general manager.

Financial Statement: net earnings on Nevada operations amounting to \$45,429 were more than offset by deficits of \$111,994 and \$34,811. Combined statement of current assets and liabilities of Coppermines and Giroux shows \$1,992,923 and \$1,538,921, an excess of assets amounting to \$454,001.

Dividends: none.

Development: in the Morris-Brooks mine 17,146 ft. of development was done in preparing mine for economical ore extraction. In the Alpha mine the most important discoveries have been on the 1200-ft. level. Other work has been done on 1000, 1100, and 1300-ft. levels. Ore-reserves include 10,000,000 tons, 1.41% copper; 10,000,000 tons, 1.25%; 156,000 tons, 3.21%; and 100,000 tons, 8.00% oxidized material.

Operations: 263,207 tons of ore containing 6,475,296 lb. copper was concentrated with a recovery of 5,197,000 lb.; 2306 oz. gold and 6234 oz. silver. Nevada Consolidated treated 201,198 tons of 1.52% ore, recovering 64% of the copper. A change in flotation reagents, from coal-tar mixture to alpha-naphthalamene and xylydin in an alkaline circuit effected economies by giving a higher grade and lower moisture. No ore has been produced since the middle of February.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

MARCHANT PLANT TO MANUFACTURE AT ONCE

The Marchant Calculating Machine Co. plant at Emeryville, Oakland, California, which was partly destroyed by fire, is already being re-built and in 60 days will again be manufacturing calculating machines, as the most important tools, dies, and jigs were saved. The plant was built in 1915 and production had just reached the highest point in the history of the company. It was considered by Government officials to house the finest and most complete tool and die department in the West.

A recent change in manufacturing methods demanded the installation of new automatic machinery which was on its way to the west coast at the time of the conflagration. This machinery will be erected in temporary quarters until the reconstructed units are finished.

The officers and directors are endeavoring to divert what stock is immediately available to the large centres where the demand for the Marchant has been greater than ever before. Service stations will be maintained in the principal centres, and the Marchant Calculating Machine Co. will endeavor to render as nearly 100% service as circumstances permit.

COMMERCIAL PARAGRAPHS

L. D. Knight, manager for the Ingersoll-Rand Drill Co. in Michigan for the past two years, has been promoted to the position of manager in charge of the business in Montana, with headquarters at Butte.

Walter Fitch, mining contractor, has returned to his headquarters at Eureka, Utah, for a short visit. He is now engaged on a large contract in Pennsylvania, which will require two years to complete.

O. H. Johnson, who has been manager of the Marcy mill department of the Mine & Smelter Supply Co. is no longer with the company. Mr. Johnson will announce his plans in the near future; in the meantime his address will be 1339 Clayton St., Denver, Colorado.

W. L. Penick, until recently connected with the Salt Lake City office of the Hardinge Conical Mill Co., has been advanced to the position of North-West sales manager, and has gone to Spokane, Washington, to open a new branch office for the Hardinge Conical Mill Company.

W. J. McRae, formerly with the Sullivan Machinery Co. and now in charge of the Mining Machinery Department of Andersen, Meyer & Co., Shanghai, China, has been in the United States the past three months. He sailed from San Francisco to Shanghai on the steamer 'Colombia,' on December 17.

Russell W. Stovel has been appointed consulting engineer to Westinghouse, Church, Kerr & Co., New York. Mr. Stovel has had a comprehensive experience in the mechanical and electrical problems connected with central power-station and steam-railroad electrification work, as well as experience in the mechanical handling of freight at water terminals. With the American Expeditionary Forces in France, Lieutenant-Colonel Stovel served as Chief of the Terminal Facilities

Division of the Army Transport Service, one of the two big divisions of transportation of which Brigadier-General Atterbury was the Chief.

The fall Yuba bulletin is devoted to a description of Yuba tractors from the viewpoint of the man who is considering their use for farm purposes, yet it contains much that will be of interest to the mining man who has haulage problems over terrain that prohibits the use of the ordinary motor-truck. A draw-bar pull of 4600 lb. at a speed of 2½ miles per hour has many applications besides plowing a field.

The machinery house of **Smith-Booth-Usher Co.** has moved its San Francisco office from the Rialto Bldg. to 40-42 Fremont St., where it has leased larger quarters. By combining warehouse, store-room, and general offices at Fremont St., the company expects to be in a better position than ever to take care of its increasing business. A complete line of supplies, including contractors equipment and machine tools, is carried. Houses are also maintained in Los Angeles and Taft.

The **Chicago Pneumatic Tool Co.** reports orders booked during the month of October in excess of any previous month since the Armistice. The same is true of its English and German subsidiaries. Although the German subsidiary was seized by the German government and has been run under "compulsory administration" since the United States participation in the War, compulsory administration has now been abolished and the management is being transferred back to the C. P. T. Co. through the Courts of Commerce, according to cable reports just received from the company's representative now returning from Berlin. Reports show the German company was well managed during the War and is now operating on a satisfactory basis. Arrangements have been made to increase production materially.

An announcement of interest to users of transmission belting in the Middle West, is that of the **Gandy Belting Co.**, of Baltimore, Maryland, regarding the establishment of a Chicago branch. The new branch, which will be opened in the near future, is expected to carry one of the largest and most complete stocks of belting in the country. It will be situated at 549 Washington street, in the heart of the machinery district. In opening a branch at Chicago, the Gandy Belting Co. expects, in addition to a prompt filling of its orders from that city, to increase the efficiency of the service for which Gandy has always been noted. **Fielder I. Schillinger, Jr.**, who has been in charge at the New York office of the company, has been transferred to Chicago where he will act as manager of the new branch. Speaking of the need for a new service station one of the Gandy officials said: "Under the spur of reconstruction, mechanical activity has increased enormously and its pressing needs can be adequately met only by prompt efficient service; complete stocks near at hand for the quick filling of orders. Gandy service has kept pace with industrial growth for more than forty years and the establishment of our new branch in Chicago is a logical step in the development of a big enterprise to meet the increasing demands for Gandy belts in the industrial and farm power machinery fields."
